Industrial Production.—For 1961 as a whole, production was about 1% higher than in 1960. The index for the year stood at 113.9 (1958=100), compared with 112.5 in the previous year. In the first quarter of 1962 it averaged about 113, and in the second quarter about 116; by September, it had risen to 118. A rise in the first half of 1961, mainly the result of increased output in the construction industries and in the production of engineering capital goods, was counterbalanced by a general decline in the second half of the year. In 1962 production in the engineering industries in the first 6 months was 3% higher than in the first half of 1961. Steel production, at 10,630,000 long tons (full year 1961, 22,086,000 tons) fell considerably, as did that of textiles. Production of synthetic fibers rose strongly, and output in June 1962 was 12% above the 1961 level. Motor vehicle production, at 876,000 units, was 125,000 units above the corresponding 1961 figure. The working population in June 1962 totaled 24,809,000, compared with 24,650,000 a year earlier. Of this total, 23,995,000 were in civilian employment, 442,000 in the armed forces, and 372,000 unemployed (compared with 251,000 in June 1961). The output of selected industries is shown in Table 2.

Table 2—OUTPUT OF SELECTED INDUSTRIES

Commodity	1960	1961
Synthetic fibers:		
Staple fibers (million lbs.)	323.4	305.6
Continuous filament yarn (million lbs.)	268.6	263.9
Cotton and cotton waste yarn (million lbs.)	595.9	554.3
Woven cotton cloth (million linear yards)	1,294.8	1,237.6
Woven synthetic fiber and mixture cloth (million linear yards)	618.8	608.4
Woolen and worsted yarn (million lbs.)	548.4	527.0
Woven woolen and worsted cloth (million linear yards)	367.1	352.0
Merchant ships completed (thousand gross tons)	1,303	1,390
Radio and television sets (thousands)	4,648.8	4,328.4
Passenger cars and chassis (thousands)	1,352.7	1,003.9
Commercial vehicles and chassis (thousands)	458.0	460.2

External Trade.—The value of British exports in 1961 was 4% higher than in 1960, totaling £3,682 million (f.o.b), compared with £3,555 million in the previous year. Reexports, at £158 million, were £17 million higher. Imports in 1961 were valued at £4,398 million (c.i.f.), £143 million, or 3%, lower than the 1960 figure of £4,541 million. The apparent trade deficit was

thus £558 million, an improvement of £288 million on 1960. Exports to the sterling area totaled £1,401 million in 1961, or 2% less than in 1960; imports from the area also fell by 2%, to £1,479 million. Trade with North America showed a fall of £38 million, a rise of 3% to Canada being more than counterbalanced by a drop of 14% (to £283 million) in exports to the United States. Imports from North America fell by 11%, to £833 million. While imports from western Europe showed only a 1% rise, exports to that area rose by 16%. Exports to Japan increased by 51%, but imports from it fell by 7%.

Engineering products, which made up 46% of the total value of exports in 1961, rose by 6%, to £1,674 million. Motor vehicle exports fell by 14%, and textiles by 4%. There were no marked changes in the pattern of imports in 1961. Statistics of British trade in 1960 and 1961 are shown in Table 3.

Table 3—BRITAIN'S IMPORTS AND EXPORTS, 1960 AND 1961

Commodity group	1960	1961
Principal Imports	(£ million, c.i.f.)	
Food, beverages, and tobacco:		
Cereals and cereal preparations	219.0	213.3
Meat and meat preparations	343.7	311.5
Dairy produce	172.6	158.2
Sugar and sugar preparations	81.4	74.8
Fruits and vegetables	240.3	251.0
Tobacco	103.6	100.7
Materials and manufactures:		
Wood and cork	186.4	177.1
Raw cotton	73.5	62.4
Raw wool and other animal hair	149.3	144.6
Rubber (including synthetic and reclaimed)	77.7	72.0
Petroleum and petroleum products	480.3	483.6
Iron and steel manufactures	100.6	49.0
Nonferrous base metals and manufactures	276.6	245.5
Machinery (nonelectric)	200.4	251.6
Textile yarns and manufactures	135.6	146.3
Chemicals	175.5	167.2
Exports of British Products	(£ million, f.o.b.)	
Iron and steel	215.4	211.7
Nonferrous base metals	98.4	102.8
Road vehicles and aircraft	505.3	439.7
Machinery (nonelectric)	712.0	816.3
Electrical machinery, apparatus, and appliances	233.2	259.0
Chemicals	316.7	325.0
Textile yarns and manufactures	261.0	249.4
Metal manufactures	157.8	159.5
Ships and boats	52.4	88.7
Food, beverages, and tobacco	196.7	207.4
Coal, coke, etc.	28.4	29.3
Petroleum and petroleum products	104.2	94.2
Basic materials	125.7	134.5

Exports in the first 9 months of 1962 totaled £2,816 million. The rapid expansion of the first 6 months slackened in the third quarter. Exports to western Europe showed the greatest rise, with a 15% increase over the 9-month period. After a rise in the first quarter of the year, exports to North America fell by 4% in the second quarter, but much of the loss was recovered in the third. Exports to the sterling area were 15% lower than a year earlier in the first quarter, 2% lower in the second, and 4% lower in the third. Imports in the first 9 months of 1962 totaled £3,355 million, showing a steady rise throughout the period. By the summer of 1962 the decline in imports from the sterling area had been reversed, and the third quarter figures showed an 11% rise over the second quarter. In the first 6 months of the year, imports from western Europe increased by 16% over the last quarter of 1961, but they fell by 4% in the third quarter. After a steady first two quarters, imports from North America rose by 3% in the third quarter, most of the increase coming from the United States. (See also INTERNATIONAL TRADE.)

Communications.—The British Transport Commission operated 48,889 miles of railroad track on Jan. 1, 1962, and owned 15,961 locomotives (13,276 steam), 37,849 passenger-carrying and 14,551 non-passenger-carrying vehicles, and 956,284 freight cars. During 1961, British Railways carried 1,024,951,000 passengers and 238,177,000 tons of freight. British Road Services owned 16,066 road haulage vehicles and 14,171 passenger vehicles on Jan. 1, 1962. British Railways showed an operating deficit of £86.9 million in 1961, but a surplus of £33.5 million on other activities reduced the commission's overall working deficit to £53.4 million. Gross receipts from carrying activities in 1961 were £710,862,883. On Aug. 31, 1962, there were 9,913,000 cars, 1,692,000 motorcycles, 84,600 public passenger vehicles, and 1,300,000 trucks on British roads.

British Overseas Airways Corporation (BOAC) carried 983,027 passengers and 16,326 tons of freight in 1961–62, with a traffic revenue of £92,713,807 and an operating deficit of £5,005,170. British European Airways (BEA) carried 4,393,378 passengers and 41,042 tons of freight, with a traffic revenue of £44,545,944 and a loss of £1,488,065 on the year's working. (See also AERONAUTICS.)

The British Broadcasting Corporation (BBC) operated 1 long-wave, 56 medium-wave, and 25 VHF transmitting stations and 28 television stations in 1962. Its income in 1961–62 was £37,788,540, including £36,731,867 from licenses and £606,524 from publications. Television programs (under controlled sponsorship) were also provided by the Independent Television Authority (ITA), which in 1962 had 22 transmitting stations in operation or under construction. Its revenue in 1961–62, consisting largely of payments from 13 program companies, was £4,879,380. On Sept. 30, 1962, licenses for television and sound broadcast receivers held by the public totaled 12,110,000 and 3,460,000, respectively.

Cable and Wireless Ltd.'s overseas telecommunications services carried 482 million words and 3,060,000 minutes of telephone traffic in 1961–62, at a revenue of £18,214,149 and a profit of £4,575,282.

On Sept. 30, 1962, the total tonnage of the British merchant fleet was 20,468,000, including a tanker tonnage of 7,255,000. In 1961, 113,892,000 tons of shipping in the foreign trade entered, and 118,884,000 tons cleared, British ports.

Events, 1962.—Britain's decision to apply for membership in the European Economic Community (EEC; Common Market) was, as in 1961, the dominating event of 1962. Negotiations at either the ministerial or the deputy's level, backed up by the work of officials and experts, continued throughout the year, and by the end of the ministerial meetings in Brussels on August 1–5 provisional agreements had been reached on a number of major points. These included (1) association for British colonies and ex-colonies dependent on the British market; (2) separate arrangements, through trading agreements, for India, Pakistan, and Ceylon; (3) abolition of the market's external tariff on tea; (4) application of the common external tariff on cotton textiles by stages over a period of four years instead of three; (5) suspension of duties on some items and a delay in bringing the tariff on processed products into effect; (6) the promotion and encouragement of worldwide trade agreements relating to temperate agricultural products; (7) reasonable opportunities for non-European temperate foodstuffs in the enlarged community; and (8) specific agreements, transitional arrangements, and the phasing out of British tariff preferences in the case of some products and manufactures. It was at this stage that the Commonwealth governments once again expressed

THE TIMES, LONDON; LONDON DAILY EXPRESS

anxieties about the possible effects on the Commonwealth of Britain's entry at the prime ministers' conference held in London on September 10–20 (see COMMONWEALTH OF NATIONS).

Negotiations between the ministers at Brussels on November 15–17 cleared the way on a number of remaining problems, including those relating to the less-developed countries not ready to join immediately in the proposed arrangements for association. Proposals were also put forward concerning tariff reductions on some processed foodstuffs, and on pulp and paper, timber products, aluminum, and other nonferrous metals. These proposals were passed to the deputies for examination before the ministerial meetings on December 15–17 and 20–22. Meanwhile, on October 4, Britain also commenced negotiations with a view to joining the European Coal and Steel Community, and negotiations with the European Atomic Energy Community opened on November 14.

The division of opinion within Britain over entry into the Common Market was illustrated at the political party conferences. At its conference in Llandudno on September 18–22, the Liberal Party expressed itself as overwhelmingly in favor. The Labour Party, meeting at Brighton on October 1–5, adopted a statement critical of the negotiations, emphasizing the importance of the Commonwealth, and suggesting the outline of new terms of membership. The Conservative Party conference, held at Llandudno on October 8–13, gave overwhelming endorsement to the government's declared intention of carrying the present negotiations to a successful conclusion.

At the meeting in Oslo on October 22 of the European Free Trade Area (EFTA; Outer Seven), all the members of which have applied to the Common Market for either membership or association, progress in reducing tariffs (which would reach 50% by the end of 1962) and abolishing quotas was reported to be well ahead of schedule. The ministers also reported progress on their negotiations with the Common Market. (See also EUROPE.)

In internal affairs, loss of the Conservative government's popularity was shown at by-elections in reduced majorities, and, in the five held on November 22, the loss of two seats to the Labour Party. The gain in Liberal strength, shown in 1961, was maintained. An extensive reconstruction of the government between July 13 and July 18 did little to change popular feeling. The main reasons for this loss of popularity were controversy over Britain's application to join the EEC, the government's wage policy (designed to counteract inflation), and rising unemployment.

The Commonwealth Immigrants Act, designed to control immigration from the Commonwealth into Great Britain, came into force on July 1. Important legislation during the year included a Road Traffic Act and a Transport Act (both August 1). The Committee on Broadcasting, appointed in 1960 under the chairmanship of Sir Harry Pilkington, issued its report on June 27. In general, the report's recommendations confirmed the position of the BBC and suggested that it should be given a second television channel, and proposed a drastic reorganization of the ITA designed to strengthen its control at the expense of the programming companies. In a white paper issued on July 4, the government postponed decision on the committee's proposals pending further study and debate. Among other reports issued during the year was that of the Royal Com-

JPI

mission on the Press, 1961–62 (chairman, Baron Shawcross), on September 19. As a result of a spate of rumors following the conviction of William J. C. Vassall, an Admiralty clerk, on charges of spying for the USSR, an independent tribunal, with quasijudicial powers, was set up under the chairmanship of Baron Radcliffe on November 14 to inquire into the affair.

Britain's support for the United States position on Cuba was demonstrated by a Foreign Office statement on October 23 supporting President John F. Kennedy's action, confirmed by Prime Minister Harold Macmillan's statement in the House of Commons on October 25, and support of the United States resolution in the UN Security Council by the British delegation. The general identity of approach to world problems of the two countries had been underlined earlier in the year, when the prime minister visited New York and the United Nations (April 25–26) and Washington (April 27–29), by the Earl of Home's address to the UN General Assembly on September 27, and in the Bahamas meeting of Macmillan and Kennedy on December 18–21. At this meeting it was decided to furnish Britain with Polaris rather than Skybolt missiles, and to develop a NATO nuclear force.

Edward Heath visited New York and Washington for discussions in connection with the Common Market on January 5–11, and Anglo-American discussions on defense took place when Peter Thorneycroft, minister of defense, visited the United States on September 10–16. Prince Philip visited the Seattle World's Fair on June 1–2, during the course of a Canadian visit from May 12 to June 6. He also visited New York on June 7, and again on November 12, en route to San Francisco (November 12–14) and Australia, where he arrived on November 21.

Relations with the Communist countries were uneventful until the development of the Cuban situation and the Chinese invasion of India on October 20. In the latter situation, Britain's support of the Indian position was apparent in the quick supply of arms to India and the dispatch of an aid mission on November 21. In Europe, Britain's relations with the NATO powers remained generally good, though complicated at times by the EEC negotiations. Prime Minister Macmillan visited Bonn on January 8–9, accompanied by Lord Home, to discuss common problems. One of the results of this meeting was an agreement on foreign exchange problems arising out of the stationing of British forces in Germany, announced on March 19. Macmillan also visited Rambouillet for discussions with President Charles de Gaulle on December 15–16.

Visitors to Britain during the year included U Thant, acting United Nations secretary general, on an official visit on July 4–7; President and Mrs. William V. S. Tubman of Liberia on an official visit on July 10–13, followed by a short private visit; and the prime minister of Japan, Hayato Ikeda, on a visit on November 12–15, during the course of which a commercial treaty between the two countries was signed (November 14). King Olav V of Norway paid a state visit to Scotland on October 16–19.

The first international earth satellite, the British-built Ariel, was launched by an American Delta rocket from Cape Canaveral on April 26. (See also Space Flight.) On March 29, Britain, West Germany, and Italy signed a convention for the formation of the European Launcher Development Organization for the development and construction of space vehicle launchers. The British Blue Streak rocket was to be the basis of the first stage of the launcher. A convention setting up the European Space Research Organization was signed by Britain and 12 other nations on June 14. A Space Research Management Group was set up under the minister of science on May 1 to manage programs of experiments in rockets and satellites.

On June 6, it was announced that BOAC and the Cunard Steam-Ship Company had formed a new joint company, BOAC-Cunard Ltd., to operate air services to and in the Western Hemisphere.

GREECE

The southernmost country of the Balkan Peninsula in southeastern Europe, Greece is a constitutional monarchy bordering on Albania, Yugoslavia, Bulgaria, and Turkey. It has an area of 51,182 square miles, including the island of Crete (3,235 square miles) and the Dodecanese (1,035 square miles). Its population (1962 est.) is 8,409,603, including Crete (482,021) and the Dodecanese (122,346). Principal cities and populations (1961 census): Athens, the capital, 621,741 (Greater Athens, including port of Piraeus, 1,837,041); Salonika, 377,026; Patras, 94,758; Volos, 67,314; Iraklion (Candia) on Crete, 64,492; Larisa, 55,733; and Kavalla, 44,406. Despite the emigration of more than 200,000 persons in 1955–61, the overall decennial increase in population amounted to 9%.

Government.—Greece is a constitutional monarchy under King Paul I (b. 1901; acceded 1947). The constitution of 1911, amended in 1951, provides for a 300-member unicameral Parliament (Vouli or Chamber of Deputies), elected for 4 years by a system of proportional representation. Following the election of Oct. 29, 1961, the Parliament was constituted as follows: National Radical Union (conservative), 176; Union of Center, 100; and Pan-Democratic Agrarian Union (leftist), 24. Executive power is vested in a cabinet, headed by a premier (Constantine Karamanlis, since Oct. 5, 1955).

Education and Religion.—Education is free and compulsory for all between 6 and 14 years of age; about 54% of the school-age population is in school. Number of schools (with enrollments), 1958–59: 10,638 primary (945,192); 781 secondary (273,390 in 1960–61); 15 teacher-training (2,366); higher (26,703 in 1959–60). In 1962, a serious economic crisis forced the University of Athens to mortgage its real estate endowment in order to meet pressing needs. The Eastern Orthodox Church is the established church, claiming more than 98% of the population. Chrysostomos II was elected primate of the national church on Feb. 14, 1962 (see below *Events, 1962*). Islam is the chief minority religion.

Finance.—Government revenue, 1962 est.: 19,065 million drachmas (up 7.4% from 1961); expenditure 18,065 million (up 12.2%); 30 drachmas equal U.S.$1. Chief components of 1962 budget expenditure: defense, 3,350 million drachmas; education, 1,772 million; social welfare and public health, 1,612 million; agriculture, 3,680 million. In 1962 it was planned to spend 6,000 million drachmas on economic investment and development (up 19% over 1961); 3,490 million was to come from domestic sources, 2,510 million from foreign sources. Expenditures by public corporations, such as the Agricultural Bank, the Economic Development Finance Organization, the Public Power Corporation, and the Telecommunications Organization, were expected to amount to 3,560 million drachmas, bringing the total expenditure for development in 1962 to 9,560 million drachmas.

Defense.—Military service is compulsory for men from 21 to 50 years of age, for a normal service period of 2 years. The army has a strength of 120,000 men. The air force comprises 23,000 men and 300 operational aircraft. The navy consists of 1 cruiser, 3 destroyers, about 20 escort destroyers, about a dozen submarines, and a number of auxiliary ships. Greece has been a member of the North Atlantic Treaty Organization (NATO) since 1951. A $50 million NATO guided missile training center was being established in 1962 on Crete.

Transportation and Communications.—Transport networks (miles, 1961): railroads, 1,683; roads, 23,000. Principal airports: Ellinikon (near Athens) and Micra

(near Salonika), served by Olympic Airways and 22 foreign airlines. In 1962 merchant shipping totaled 1,213 vessels with 6,687,889 gross registered tons (5.8 million in 1961). Other communications data (1961): passenger cars, 43,224; buses, 6,364; trucks, 30,683; telephones, 195,242; radios, 743,000 (in 1959).

Economic Indicators.—Gross national product, 1960: 95.78 billion drachmas (90.21 billion in 1959). National income, 1960: 80.51 billion drachmas (75.69 billion in 1959). Index of industrial production (1958 = 100): 117 in 1961; 111 in 1960. Cost-of-living index (1958 = 100): 106 in 1961; 104 in 1960. Number of unemployed workers: 76,000 in 1961; 86,700 in 1960.

Manufactures and Minerals.—Chief industrial products (metric tons, 1961): cement, 1,830,000 (1,630,000 in 1960); lignite, 2,520,000 (2,556,000); cotton yarn, 26,400 (29,560); wool yarn, 8,000 (5,000); electric power, 2,496 million kw.-hr. (2,208 million). Index of manufacturing production (1953 = 100): 180 in 1961; 172 in 1960.

Agriculture.—Greece's economy is primarily agrarian; agriculture yields about 32% of the gross national product. Chief food crops (in 1,000 bu., 1962 est.): barley, 11,900 (10,800 in 1961); oats, 10,900 (10,550); corn, 11,780 (11,330); wheat, 58,500 in 1961 (62,200 in 1960). Chief cash crops (tons, 1962 est.): raisins, 90,000 (64,500 in 1961); dried currants, 115,000 (98,000); dried figs, 31,000 (31,000); tobacco, 216,687,000 pounds (162,287,000); table olives, 98,500 in 1961 (24,000 in 1960); wool, 25.6 million pounds (25.5 million).

Foreign Trade.—Total exports, 1961: 6,700 million drachmas (6,096 million in 1960); imports, 21,422 million (21,061 million in 1960). In 1961, tobacco exports accounted for 2,487 million drachmas (2,188 million in 1960); currants, 884 million (866 million in 1960). The trade deficit is made up in part by tourism (399,438 visitors in 1960, spending $51.4 million), merchant shipping income ($88.6 million first 11 months 1961), and remittances from Greek emigrants ($90 million in 1960). Chief trading partners: West Germany, the United States, Great Britain, and countries of eastern Europe.

Events, 1962.—The problems of the Greek economy increased in number and complexity in 1962. On June 30, economic aid from the United States, which amounted to $3.42 billion from 1947 to 1962, came to an end. While per capita income was expected to rise about 3% ($320 in 1961), agricultural income fell below expectations, as much of the agricultural produce remained unsold as the year approached its end. Unemployment continued to be high, relieved in part by government doles and continued emigration to West Germany and Belgium. Mass demonstrations and clashes of peasants with police occurred during the year at Agrinion, Kavalla, Salonika, and Iraklion.

The big test for the Greek economy started on November 1, when Greece started her associate membership in the European Economic Community. The association with the European Common Market will entail the expansion of certain industries and products and the curtailment of others, with resulting economic dislocations. Previously, on July 31, a consortium of Belgium, Canada, West Germany, Great Britain, Italy, Luxembourg, Netherlands, and the United States, in conjunction with the Organization for Economic Cooperation and Development (OECD), was formed to provide economic aid to Greece.

At Greek Orthodox wedding ceremony in Athens on May 14, King Paul of Greece places crowns on his daughter, Princess Sophia, and Prince Juan Carlos of the Spanish Bourbons.

WIDE WORLD

Religious controversy flared up in January with the election of Iakovos, metropolitan of Attica and Megara, as primate of the Greek Orthodox Church to succeed Archbishop Theoklitos, who died on January 8. On January 25, Iakovos abdicated after a public clamor against his election and a threat from the government to remove him from his office. On February 14, Chrysostomos, metropolitan of Kavalla, was elected archbishop. On April 4 the supreme canonical court cleared Iakovos of the charges brought against him.

Relations with other Orthodox Churches improved during the year. On April 13 the newly recognized patriarch of Bulgaria visited Athens, followed by the patriarch of Rumania in June. On June 25 it was announced that Greece had rescinded its ban on visiting Mount Athos by Archbishop Nicodemus of the Russian Orthodox Church.

The political life of the country was characterized by unrest, emanating from the vehement criticism of ex-premier George Papandreou, leader of the Union of the Center. Violence broke out in Athens on April 20, during a demonstration protesting alleged electoral fraud and other abuses in the elections of Oct. 29, 1961. Scores were injured and many arrested. A motion of no confidence, sponsored by the Union of the Center, failed to pass the Chamber of Deputies on May 15. Parliament was in adjournment most of the year, leaving the work to a legislative committee. The committee discussed government proposals for relaxing the security measures which have been in force since the civil war (1946–49). The opposition held that the proposed government plans were inadequate and not sufficiently democratic, and abstained from voting. Among the acts of leniency initiated by the government was the release of a number of Communists and other leftists from concentration camps, although the Communist Party remained outlawed.

Greece's membership in NATO continued to be the pivot of its foreign policy during the year. On January 4, Greece rejected a Soviet protest against the alleged stockpiling of nuclear weapons in Greece. At the NATO conference held in Athens in May, Greece pointed out that her military expenditure was excessive in proportion to her resources, and asked, unsuccessfully, for $100 million in aid from NATO.

Greece's relations with Albania and Turkey improved during the year. In June, Albania freed some 40 Greeks that had been held captive since the 1946–49 Greek civil war (see also ALBANIA). Relations with Turkey were reportedly improved, following the visit of Greek Foreign Minister Averoff-Tossitsas on August 4–7. Relations with the Communist bloc showed no improvement, although a somewhat more cordial atmosphere prevailed in official contacts with Rumania.

Relations with Yugoslavia, however, became cooler because of the raising by Yugoslavia of the question of Slavic-speaking people in northern Greece. As a precaution, Greece suspended the provisions of the Greco-Yugoslav agreement concerning frontier travel between Florina, Greece, and Bitolji, Yugoslavia.

On February 16, Greece protested to the United Arab Republic against the delay in answering the Greek request for prompt payment of indemnities for confiscated Greek property in Egypt. Most of the property of the formerly prosperous Greek community in Egypt, estimated at £120

million, has been confiscated under the UAR's nationalization program. It was estimated that in 1962 about 500 Greeks were being repatriated from Egypt each week.

The visit of U.S. Vice President Lyndon B. Johnson on August 31–September 3 occasioned demonstrations of goodwill toward the United States. Similarly, the marriage of Princess Sophia, eldest daughter of King Paul, to Don Juan Carlos, son of the pretender to the throne of Spain, on May 14, brought forth expressions of goodwill for the monarchy.

G. G. Arnakis,
Professor of History, University of Texas.

GREEN, Howard Charles

Canadian secretary of state for external affairs: b. Kaslo, British Columbia, Nov. 5, 1895.

A lawyer and member of the Progressive Conservative Party, Howard Green has represented Vancouver in Canada's House of Commons since 1935. After the elections of June 10, 1957, when his party came to power, he was named minister of public works in the cabinet of Prime Minister John Diefenbaker, and served as acting minister of defense production for almost a year. He was named to his present post on June 4, 1959.

As head of the Canadian delegation to the 17-nation Disarmament Committee, which met in Geneva on March 14, 1962, Green proposed (March 28) a ban on the launching of nuclear weapons into space and an agreement to give notification of all missile launchings; this suggestion was rejected by Soviet delegate Valerian A. Zorin. On June 14, Green rejected as an unwarranted interference in Canadian internal affairs a note from the Soviet ambassador in Ottawa charging that Canada was preparing to arm itself with nuclear weapons. The note was generally interpreted as an attempt by the USSR to discredit the Conservative Party just before the Canadian elections of June 18, in which the foreign secretary was returned to his seat in Parliament.

Green addressed the House of Commons in 1962 on two major issues affecting Canada's relations with the United States. On April 9 he assured Parliament that the controversial Columbia Basin Treaty (signed Jan. 17, 1961, but not ratified by Canada) would be referred to the House Committee on External Affairs. He also told Parliament (October 4) that the government would take no steps to prevent Canadian ships from carrying cargoes between the Soviet Union and Cuba. Canada, however, fully supported the United States position during the Cuban crisis of October 1962. At the end of October, Green announced that his government had offered arms and transport aircraft to India in her border war with Communist China. (See also Canada.)

GREENLAND

Situated northeast of Canada, Greenland is an island department of Denmark. It has an estimated area of 840,000 square miles, of which about 58,000 square miles may be classified as inhabited. The population (1961 est.) is 35,000, mostly of Eskimo descent, with an admixture of Europeans. Godthaab (pop. est., 3,000) is the capital and main settlement. Greenland is administered by an appointed governor (N. O. Christensen), assisted by an elected 13-member Provincial Council (Landsraad). The United States maintains a military airbase at Thule, and has other military installations on the island.

The population is mainly engaged in fishing, processing of fish products, hunting, and mining. In 1960 the fish catch totaled 35,200 metric tons. Principal minerals (metric tons, 1960): coal, 30,000; lead ore, 6,900; zinc ore, 10,100. Total exports, 1960: 58,340,000 Danish kroner; imports, 112,010,000 (the Danish krone equals U.S.$0.148). Trade is conducted mainly with Denmark.

GRENADA. See West Indies Federation.

GROMYKO, Andrei Andreyevich

Soviet minister of foreign affairs: b. Starye Gromyki, near Minsk, Belorussian SSR, July 6, 1908.

After graduating from high school and a teachers college in Minsk, Gromyko was graduated in 1936 from the Institute of Economics in Moscow with a master's degree in foreign politics and economics. In 1939 he entered the Commissariat of Foreign Affairs as head of the American desk, and later that year joined the Soviet embassy in Washington, D.C., as counselor. In 1943 he succeeded Maxim Litvinov as ambassador to the United States. He participated in the Teheran, Dumbarton Oaks, Yalta, and Potsdam conferences and the founding conference of the United Nations Organization in San Francisco (1945). As permanent Soviet representative to the United Nations from 1946 to 1948, he vetoed 25 proposals in the Security Council.

Gromyko was recalled to Moscow in 1948 as deputy foreign minister; he subsequently served as first deputy foreign minister (1949–52 and 1953–57) and ambassador to Great Britain (1952–53) before succeeding Dmitri T. Shepilov as foreign minister in February 1957. A member of the Communist Party of the USSR, Gromyko has been a deputy to the Supreme Soviet since 1946. He was elected to the Central Committee of the party as an alternate member in 1952 and as a full member in 1956.

Gromyko participated in the 17-nation disarmament talks in Geneva in March, and on July 23 in Geneva he signed the 14-nation agreement guaranteeing the freedom and neutrality of Laos. He discussed Berlin with U.S. Secretary of State Dean Rusk in Geneva (July 21–24) and New York (September 24 and October 6), and with British Foreign Secretary Home in New York (October 1), without reaching accord.

Visiting President Kennedy in Washington, D.C., on October 18, Gromyko insisted that Soviet assistance to Cuba "pursued solely the purpose of contributing to the defense capabilities" of the island. Four days later, in his radio-television address announcing the naval quarantine of Cuba, the president described this statement as false. Immediately afterward, Gromyko returned to Moscow by way of East Berlin. Addressing the Supreme Soviet on December 13, he said there was no inevitable cause of conflict between the United States and the USSR.

GROUP INSURANCE. See Insurance.

GUADELOUPE

Situated southeast of Puerto Rico in the Caribbean Sea, this French overseas department is comprised of Guadeloupe proper (the islands of Basse-Terre and Grand-Terre), and several island dependencies (Les Saints, Marie-Galante, Petite Terre, Désirade, Saint Barthélemy, and Saint Martin, part of which belongs to the Netherlands). The total area is 687 square miles; population (1961 est.), 276,000. The people are of Negro-Carib-European descent and speak a French patois. Pointe-à-Pitre (est. pop., 45,000) is the chief port; Basse-Terre (est. pop., 15,000) is the capital.

The department is administered by a French-appointed prefect (Albert Bonhomme), who is assisted by a 36-member General Council elected by universal suffrage. In

1961–62 there were 285 primary schools (with 63,773 pupils), and 2 secondary schools (2,211). Raizet Airport, near Point-à-Pitre, handles jet aircraft.

The economy of the department is based on the export of sugar (159,276 metric tons in 1961) and bananas (122,363 metric tons). Guadeloupe is one of the world's major producers of rum (39,689 metric tons exported in 1961). Total exports in 1961 were valued at 17,812 million francs; imports, 25,858 million francs. Trade is mainly with France.

Guadeloupe was the site of a major air disaster on June 22, 1962, when a Boeing 707 jet airliner crashed near Pointe-à-Pitre and all 113 persons aboard were killed.

GUAM

The largest and most populous of the western Pacific islands known as the Marianas, Guam is an organized but unincorporated territory of the United States. Most southerly of the group, it lies 13° north of the equator, approximately 6,000 miles southwest of San Francisco, Calif. Thirty miles in length and 4 to 8½ miles in width, the island has an area of 209 square miles.

Population.—The population (May 1962) is 43,798, excluding transient United States military personnel and their families. The military community is estimated at approximately 30,000 persons. The local Guamanians are a mixture of native Chamorro stock with outside strains and are predominantly Roman Catholic in religion. Although English is the official tongue, the Chamorro dialect is widely used.

Places with populations of 2,500 or more Guam citizens in 1962 were Agaña Heights, 2,603; Agat, 3,202; Dededo, 3,187; Sinajana, 4,737; and Tamuning, 4,518. Agaña, with a population of 1,443, is the capital.

Government.—Guam is administered under the Organic Act of 1950, as amended. The island's relationship with the United States government comes under the general supervision of the U.S. Department of the Interior. Guamanians are citizens of the United States without the right to vote in United States elections and with no representation in the U.S. Congress.

The local government comprises executive, legislative, and judicial branches, with the executive branch of 10 departments headed by a civilian governor appointed by the president of the United States. A 21-member unicameral legislature, biennially elected at large, is empowered to pass laws on local matters, including taxation and appropriations measures.

The District Court of Guam has jurisdiction in all federal cases and in many others arising under the laws of Guam. Its decisions may be appealed to higher United States courts. Lesser courts may be created by the Guam legislature to have jurisdiction over cases arising in Guam; the Island Court is the ultimate local court.

Finances.—The operating budget for Guam is derived largely from taxes on personal income, specific sales, and business gross receipts. Banking facilities are provided by two bank branches, one of the Bank of America and one of the Bank of Hawaii, and by the Guam Savings and Loan Association.

Education and Social Welfare.—School attendance is compulsory between the ages of 6 and 16, inclusive. As of January 1962 there were 14,002 pupils enrolled in Guam's 20 elementary schools, two junior high schools, and two junior-senior high schools. The tuition-free College of Guam, which was made a four-year college in 1961, had an on-campus enrollment of 1,326 in the school year 1961–62, with an additional 745 enrolled in its extension facility at Guam's Andersen Air Force Base and 320 in that at the U.S. Naval Station.

The Guam Memorial Hospital and the naval hospital serve the major health needs of the residents. Public and private health clinics are located throughout the island.

Transportation and Communications.—Pan American World Airways makes three scheduled weekly passenger flights in and out of Guam, plus two regular weekly cargo flights, and United States Overseas Airlines makes one flight weekly. Vessels of the American President Lines call at Guam on an average of two times a month, and those of the Pacific Far East Line call on an average of three times a month. Guam is also the home port of the Pacific Micronesian Line, under contract to the Trust Territory of the Pacific, and of the locally owned Pacific Navigation System. Land transportation consists mainly of taxicabs and private automobiles, served by about 183 miles of paved and 47 miles of improved roads.

The Radio Corporation of America provides overseas telephone and radio dispatch facilities. Chief news media include the *Guam Daily News;* the associated *Territorial Sun,* a Sunday publication; and the military daily, *Stars and Stripes,* which is made available to the public. There are also local radio and television facilities.

Economy.—Guam's economy is undergoing a transition marked by the decline in military construction and some military activities. A concerted effort is being made to further develop the island's natural resources, which are relatively limited.

Agriculture and inshore fishing are the two principal supports of the civilian economy. Productive acreage is being increased under an intensified program sponsored by the territorial government.

Commercial farm income from truck crops, field crops, fruits and nuts, poultry products, and cattle increased greatly from 1960 to 1962. For example, egg production was increased from 34,320 dozens per month in 1960 to 53,807 dozens per month during the fiscal year 1962. The Department of Agriculture has greatly increased and improved its breeding stock, and is sponsoring a program to upgrade private cattle and swine herds.

Nonfarm production activities are largely limited to quarrying of crushed coral limestone and light manufacturing of food and beverages. A tourist industry is beginning to develop, and the island's first 100-room resort hotel is scheduled for completion in 1963.

Foreign Trade.—Guam is a duty-free port and levies no customs duties on imports. Its commercial port area occupies 24.5 acres and has 2,160 linear feet frontage of deep-water docking space, sufficient for the berthing of three large cargo vessels, and 100,000 square feet of warehouse space. For the fiscal year 1962, imports totaled 101,487 revenue tons valued at $20,717,723; exports, 37,201 revenue tons valued at $6,352,605; and transshipments, 14,751 revenue tons.

Events, 1962.—On August 21, President Kennedy revoked a 1941 presidential executive order which had required that all persons entering Guam undergo a lengthy security investigation by the Navy. Entry of United States citizens is now unrestricted; entry of foreign nationals is governed by the normal regulations of the Immigration and Naturalization Service imposed in all other parts of the United States. President Kennedy also modified restrictions on entry to the islands of the Trust Territory of the Pacific, opening them to United States citizens. These actions are expected to remove Guam from the "military bastion" category and encourage the growth of the civilian economy, especially in the field of tourism.

Typhoon Karen, the worst storm in the island's history, struck Guam on November 11–12, killing eight persons, injuring hundreds, and causing damage to homes, commercial buildings, and government structures estimated at over $100 million. More than 90% of the homes and about 50% of the commercial buildings were demolished. President Kennedy declared Guam a major disaster area, and the military and other federal organizations poured in millions of dollars in relief funds. The island's government immediately organized a gigantic rehabilitation program, including urban renewal and other plans which will rebuild the island according to higher standards. The rebuilding is expected not only to create a better community, but to pump millions of dollars into the island's economy in the next two years.

MANUEL F. L. GUERRERO,
Acting Governor of Guam.

GUATEMALA

Guatemala is the northernmost, most populous (official mid-1962 est., 3,980,000), and third largest (42,042 square miles) of the six republics of Central America. Its racial distribution is 67% Indian, 30% mixed (mestizo, called ladino in Guatemala), and 3% white. The capital, Guatemala City, with nearly 450,000 inhabitants in 1961, is the only large city.

Government.—Guatemala is a unitary republic headed by a president elected for a term of 6 years by an absolute majority of the popular vote. Under the constitution of 1956, if no candidate receives such a majority, the unicameral National Congress of 66 members (serving 4-year terms, with half being renewed every 2 years) elects the president. President Miguel Ydígoras Fuentes began his term on March 2, 1958. There is no vice president, but the first designate succeeds to the presidency. No president may be reelected until two terms have intervened. Although

municipal offices are elective, the president appoints governors for the 22 departments. The constitution provides formally for separation of powers and checks and balances, but the authority of the executive is great, and in practice strong presidential government prevails. The judges of the Supreme Court of Justice and six appellate courts are elected by Congress for 4-year, renewable terms.

Education and Religion.—School enrollment (1960): 315,075 pupils in 3,902 primary schools; about 60,000 in secondary schools. Guatemalans have long recognized the need to make education available to the illiterate Indians and ladinos in the rural areas. In 1960, President Ydígoras began a determined effort to build rural schools; 116 new schools were constructed in 1961, and the program continued in 1962. The second largest amount in the 1961–62 budget, 14,476,495 quetzales (1 quetzal equals U.S.$1) was allotted to education. The University of San Carlos, with more than 5,000 students in 10 faculties (1961), has long provided distinguished instruction, though in the arts and humanities rather than in science, technology, and agriculture. Rafael Landívar University was inaugurated in 1961.

Almost all Guatemalans are Catholics, and the Roman Catholic Church exercises a constructive influence on social and economic life.

Finance.—The 1961–62 budget was fixed at 121,028,834 quetzales, but actual expenditures were estimated at 115,000,000. Nevertheless, because of low tax collections, a deficit of 8,000,000 quetzales was reported. In the budget adopted by Congress for 1962–63, revenues and expenditures were expected to be balanced at 106,000,000 quetzales. Gold and foreign exchange holdings of the Bank of Guatemala rose from $51 million on Dec. 31, 1961, to $64.7 million on March 31, 1962, but declined thereafter, to $50.3 million on July 31. A drawing of $3 million was made from the International Monetary Fund late in March and another of $2 million early in June under a $15 million standby agreement. A further decline in reserves caused the cabinet, effective October 13, to approve exchange controls for the quetzal, which had been freely convertible since 1925.

Transportation and Communications.—Transport networks (miles): International Railways of Central America, 510; Verapaz Railroad, 29; United Fruit Company, 180 (plantation lines); roads, over 5,000, including the 306-mile Inter-American Highway, the parallel 204-mile Pacific Highway, and the intersecting Interoceanic Highway. Air services: 7 international airlines, including the government-owned AVIATECA, which schedules flights to the United States in addition to its domestic services. Communications facilities (1961): 17,900 telephones; 18 radio stations; 2 television stations.

A mountainous terrain makes the construction and maintenance of adequate roads and railroads difficult and costly. Guatemalans realize the necessity of improving transportation facilities if the country is to achieve rapid economic development, however, and the 1961–62 budget provided 30,573,277 quetzales for communications and public works, much of which was earmarked for roads.

Production.—The Guatemalan government estimated the gross national product at 634.5 million quetzales at the end of 1961, as compared with 646.5 million a year earlier. In contrast, the general industrial production index (1958 = 100) rose from 106 in 1960 to 112 in 1961. Among the developing industries are canning, meat packing, and the production of glass, fertilizers, and insecticides. There are well-established clothing and tobacco industries, and the construction industry has been furthered by lumber, paper and paperboard, and furniture establishments, by the manufacture of cement (126,000 metric tons in 1961), brick, and tile, and by a new structural steel plant. The output of electricity exceeded 2 billion kw.-hr. in 1961. During 1962 the Inter-American Development Bank approved loans of $3.5 million to help finance 51 water supply and 31 sewer projects (March 19) and $5.3 million for housing (August 7).

The principal export crops are coffee (which supplies three fourths of foreign exchange earnings), bananas, cotton, essential oils, and chicle. Corn, beans, sugar, rice, wheat, cacao, potatoes, and plantains are produced mainly for domestic consumption. The new five-year International Coffee Agreement, which was opened for signature on Sept. 28, 1962, allocated to Guatemala a quota of 1,344,500 bags (132.276 pounds each). Since exportable production for 1961–62 amounted to 1,450,000 bags and the 1962–63 exportable crop was forecast at a record 1,650,000 bags, Guatemala had been reluctant to sign the new agreement, but did so after the National Congress, on September 27, reduced the coffee export tax.

After suffering losses of about $2 million as a result of a hurricane in October 1961, the Standard Fruit Company withdrew from banana cultivation in Guatemala in 1962. Production of other crops was as follows in 1961–62, in thousands of metric tons: corn, 506 (1960–61); cotton, 38; cottonseed, 65; dry beans, 30; and centrifugal sugar, 103.

Foreign Trade.—In 1961, Guatemala exported goods worth $115.2 million ($119.4 million in 1960) and imported goods worth $133.9 million ($137.8 million). As in previous years, the United States was the country's chief supplier, furnishing 47.8% of the total, and its principal customer, accounting for 55% of all sales. Other leading suppliers were West Germany, the Netherlands Antilles, El Salvador, Japan, and Great Britain; other major customers, West Germany, Japan, El Salvador, the Netherlands, and Sweden.

Under the General Treaty of Central American Economic Integration, which went into effect in June 1961, progress has been made in strengthening the legal and technical bases of the common market of its signatories. On Aug. 23, 1962, Congress approved (32–15) President Ydígoras' recommendation for the creation of a Ministry of Central American Economic Integration.

Events, 1962.—The progovernment coalition of three parties won 26 of the 33 congressional seats at stake and three fourths of the municipal offices in the elections of Dec. 3, 1961. Although the Partido de Unión Democrática (PUD) later withdrew from the coalition, President Ydígoras retained a majority of 41 of the 66 congressional seats in 1962. The opposition charged the government with *imposición* (rigged elections) and fomented disorder, while the government repeatedly imposed a state of siege (January 24–May 19).

On February 6, about 60 army exiles entered the country from Honduras and stole 18,000 quetzales from the United Fruit Company headquarters at Bananera. Loyal armed forces and the secret police suppressed student-led demonstrations in Guatemala City (March 9–19) and violent political activity in the countryside. At least 25 persons were killed, 500 wounded, and more than 1,000 arrested before order was restored.

Student strikes reached a peak on March 15–16, when the army was compelled to assume control of the capital city, including public transportation, electric services, and the telegraph system. Further violence occurred in April and May. The president blamed the Communist-oriented Partido Guatemalteco del Trabajo (PGT); other leftist,

President Manuel Ydigoras Fuentes (at left, carrying machine gun), checks defenses of Guatemala City on November 25 after brief revolt by members of the Guatemalan Air Force.

UPI

Communist, and front groups; and, in a note of March 20 to the Organization of American States, the government of Cuba.

A large bomb was detonated on June 12 at a barracks about 350 feet from the National Palace in Guatemala City. Other bombs were exploded in June and July, one of which caused considerable damage to the West German embassy. Leftist forces were heartened by the decision of former President Juan José Arévalo to return to Guatemala to campaign for the presidency in 1963. On the morning of November 25, units of the air force revolted and strafed military installations and the presidential palace in Guatemala City for three and one-half hours before being crushed by troops loyal to the government.

The dispute with Great Britain over British Honduras (Belize), which Guatemala claims, was the subject of Anglo-Guatemalan talks in San Juan, Puerto Rico, on April 16–20, 1962. Some agreement was reached on economic matters but not on the basic political issue.

WILLIAM S. STOKES,
Senior Professor of Comparative Political Institutions, Claremont Men's College.

GUIANA. See BRITISH GUIANA; FRENCH GUIANA; SURINAM.

GUINEA

The Republic of Guinea, formerly one of the eight territories of French West Africa, is situated on the west coast of Africa. Its area of 97,000 square miles is about the size of Oregon. There are no reliable population figures; the best present estimate is slightly less than 3 million. Conakry, capital and largest city, has a claimed population of 80,000. The only other sizable towns are Kankan (30,000) and Kindia (25,000). The people of Guinea are divided into numerous tribes, all speaking different languages. The language of government and business is French. There are three main tribes: Fullah (also known as Peuhls), 1.1 million; Malinke (or Mandingo), 525,000; Soussou, 225,000.

Government.—Guinea attained independence by refusing to accept membership in the Fifth Republic in September 1958. It is governed by a single political party, the Democratic Party of Guinea (PDG). The Political Bureau of the PDG is in effect the national executive. The government is the administrative arm of the party. The unicameral National Assembly gives legal effect to party decisions. The president of the republic, who is also secretary general of the PDG, is (Ahmad) Sékou Touré. He was elected to a constitutional seven-year term in January 1961 after serving by acclamation from independence. The Republic of Guinea has formed a loose political union with Ghana and Mali (the Union of African States).

Education and Religion.—The literacy rate is estimated at 10% of the population, and about 15% of school-age children attend school. All schools since August 1961 are state-operated. Number of schools (with enrollments), December 1961: 420 primary (84,000); 14 secondary (5,500); 4 technical (1,650). Over 80% of the population profess Islam; another 15% are animists, and the remainder Christian, mostly Catholic.

Finance.—In March 1960, Guinea left the franc zone and instituted its own currency, the Guinean franc, which has a legal rate of exchange of 247 francs to U.S.$1. Total circulation was 12.3 billion francs on Dec. 31, 1961. The ordinary budget estimate for 1962 was balanced at 9.7 billion Guinean francs. Development budget expenditures for 1960–63 were estimated at 45.2 billion, of which approximately 27 billion was being financed from foreign loans and grants, and the remainder from internal resources. Loans and grants from foreign sources total about $180 million from 1958 to 1962. Total external indebtedness is estimated at $62 million, of which about $42 million is to Sino-Soviet bloc countries and $12 million to France.

Transportation and Communications.—Transport networks (miles): classified roads, 4,000 (125 miles paved); state-owned railway, 400. National airline: Air Guinée, which operates an internal network and international service to Mali, Senegal, Liberia, and Ghana. Six foreign airlines serve Guinea. Passenger and freight service is provided by United States, French, Ghanaian, and Soviet ships. The state operates a 100-kw. short-wave transmitter, which was built by Soviet technicians under the development plan.

Mining and Industry.—Gross national product in 1961 was estimated at $182 million. Guinea possesses over a quarter of the world's known bauxite reserves. The only important industry is the Fria Company (owned by United States, French, British, Swiss, and German interests), which converts bauxite to alumina. Current production, which began in mid-1960, is 480,000 tons annually. In addition, another 360,000 tons of unprocessed bauxite are produced annually by a state enterprise. Iron ore produced in 1961 from a deposit near Conakry was 535,000 tons. Extensive iron ore deposits in the Nimba Mountains are to be developed by a consortium of European banks. Industrial diamond production by a state monopoly in 1961 was over 1 million carats, valued at $7.8 million. Output of electric power in 1960 totaled 35 million kw.-hr.

Agriculture.—About 90% of the population depend on agriculture directly or indirectly for their living. Production of subsistence crops in 1961 (thousands of metric tons): rice, 320; cassava, 350; potatoes, 125; millet, 120; corn, 60; taro, 40. Production of crops raised mainly for export (thousands of metric tons, 1961): bananas, 72; palm kernels, 23; coffee, 16; shelled peanuts, 9; pineapples, 5. Cattle raising is of importance in the north. The state has attempted to develop a fishing industry with Polish technical cooperation. The fish catch in 1961 was estimated at 11,000 tons (up 50% from 1960).

Foreign Trade.—Total exports, 1961: 18 billion Guinean francs (up 15% from 1960); imports (excluding capital imports under the development budget): 18 billion (up 50%). Origin of imports: Sino-Soviet bloc, 41%; franc zone, 18%; other countries, 41%. Destination of exports: Sino-Soviet bloc, 18%; franc zone, 31%; other countries, 51%. Alumina and bauxite account for over 50% of exports.

Events, 1962.—Late 1961 and early 1962 were marked by a weakening of the close relations between Guinea and the Soviet Union that had commenced with independence, and an attempt to reestablish close relations with the West and the moderate African states. In November 1961, after a strong protest against the government by the teachers' union and a strike by students, Sékou Touré accused "certain Eastern embassies" of sowing unrest among the population. He requested the recall of the Soviet ambassador. A visit to Conakry by Soviet Deputy Premier Mikoyan in January was not notably successful in re-establishing cordial relations. Since then, enthusiasm for the Communists has cooled, but the Soviet bloc continues to supply the bulk of foreign development funds and technicians.

In April a high-level Guinean mission visited the United States and negotiated an enlarged aid and surplus commodity program. Relations with the United States were also improved by the visit of Sékou Touré to Washington in October. He conferred with President Kennedy on October 10, and asked the United States government to expand its economic assistance programs in Guinea.

Recent Guinean diplomatic activity in Africa was directed at bringing about a rapprochement between the "radical" Casablanca powers and the "moderates" of the 12-nation African and Malagasy Union. Tentative steps were also taken toward easing Guinean relations with France that have been strained since independence.

WIDE WORLD

H

HAITI

The Republic of Haiti shares the Caribbean island of Hispaniola with the Dominican Republic. Haiti comprises the western third of the island and has a total area of 10,714 square miles. The population of about 4,346,000 (1962 est.) is over 85% rural, chiefly Negro, with a small mulatto elite. Haiti has the greatest average population density of any Latin American republic (405.6 per square mile), and the lowest average life expectancy (32 years). The language is French, but most of the people speak Creole, a related dialect. The only large city is Port-au-Prince, the capital (1961 est. pop., 250,000). Other principal cities, with urban populations (1961 est.) are Cap Haïtien, 30,000; Les Cayes, 14,000; Gonaives, 12,000; and Jérémie, 12,000.

Government.—Following a period of political strife bordering on civil war, Dr. François Duvalier became president in October 1957. The new president used terrorist tactics to maintain himself in office, but his measures to liquidate opposing groups did not prevent repeated attempts at revolt, and, in April 1961, Duvalier sought to strengthen his hold on government by dissolving the congress. Rigged elections followed, with Duvalier in effect choosing the 58 members of a new unicameral legislature and naming himself as president for another 6-year term two years before his first term had expired. The United States expressed official displeasure at this turn of events, and unrest continued as cuts in American aid rendered the dictator's position more precarious. (See also below, *Events, 1962*).

Education and Religion.—The illiteracy rate in Haiti stands at about 90%, the worst among the Latin American republics. Since Duvalier came to power in 1957, statistics on primary and secondary education have become nonexistent. Available information (1957) indicates 1,447 primary schools with 203,032 students; 47 secondary schools with 8,990 students; and a few technical, teacher-training and special schools, with 4,433 students. The University of Haiti in 1961 had 1,500 students. Roman Catholicism is the chief religion, although voodooism is practiced as a folk religion.

Finance.—The budget estimate for the fiscal year beginning Oct. 1, 1962, amounted to $28.8 million ($30.4 million in 1961–62). There is some indication that the government maintains a secret fund to retain its support among the presidential police, some elements of the military, and other key groups. The United States has been channeling an average of over $12 million annually in aid to Haiti. Approximately half of this aid goes to balance Haiti's budget, and half is used for various social and economic programs. The unit of exchange is the gourde, equal to U.S.$0.20.

Transportation and Communications.—Haiti had about 1,900 miles of roads and approximately 220 miles of railways in 1959. The Haitian Air Force maintains a domestic air service, and several international airlines provide services. Motor vehicles numbered 8,100 in 1960; telephones, 4,400 (1960); radio licenses, 21,000 (1959). A television station was established in 1959, and sets were estimated at 2,500 in 1962. Haiti has 4 daily, 2 weekly, and 1 biweekly newspaper (1962) with a total circulation of about 20,400.

Production.—A large majority of Haitians live in extreme poverty. Annual per capita income in 1957 was estimated at $72. Daily caloric intake was reported at 1,875 (1958), as compared with 3,100 for the United States. Over 90% of the jobs are in agriculture. Coffee is the chief crop. Principal cash crops and yields, 1961–62, were: coffee, 700,000 bags of 60 kilograms (about 132 pounds) each (up 65% from 1960–61); sisal (1961), 86 million pounds (up slightly); sugar, 74,000 short tons (down 7.5%); and cocoa beans, 5.3 million pounds (up 18%). Subsistence crops include corn, rice, beans, manioc, yams, avacados, mangoes, and other fruits.

Manufacturing is on a small scale. The chief products are denim cloth, soap, cement, lumber, tobacco, and sisal bags for coffee. Production of electrical energy increased from 26.6 million kw.-hr. in 1956 to 52.9 million in 1959. Some copper is produced, and 375,000 long tons of bauxite were mined in 1960–61. Revenue from the tourist trade averages about $8 million annually.

Foreign Trade.—Haiti's exports in 1961 totaled $32 million ($33.1 million in 1960); imports, $34.7 million ($36.1 million). Coffee provided 42.1% of the total value of 1961 exports; sisal, 9.9%; and sugar, 15.8%. Imports are chiefly wheat and other foodstuffs, petroleum products, cotton goods, and a few other manufactures. The United States, Haiti's principal trading partner, purchased $19.1 million in Haitian exports in 1961 and provided $25.9 in imports.

Events, 1962.—Actions of President Duvalier's secret police prompted protests over incidents of extortion and physical violence against foreign nationals. Great Britain withdrew its ambassador on March 10, and the United States did likewise on May 21, though both countries left a token diplomatic force to operate their embassies.

Economic aid from the United States was suspended in May when the Duvalier government rejected various United States conditions for continuing assistance under the Alliance for Progress, including reduction of Duvalier's personal secret police and militia, publication of nonfiscal accounts, arrangements for a presidential election in 1963, and detailed specifications concerning projects for which aid might be given. Military aid declined to a bare minimum, although a small advisory mission maintained liaison with Haitian Army leaders who might form the core of an opposition capable of ousting Duvalier.

In September, Duvalier assumed direct control over the economy and was empowered to issue treasury certificates for compulsory loans from wage earners, importers, exporters, and insurance companies. Major United States concern centered around the determination that violence directed at Duvalier should not result in establishment of a pro-Communist government. In November the government deported a Roman Catholic bishop and three priests, and the Vatican excommunicated all Catholics responsible for the deportation.

HAWAII

Admitted to the Union on Aug. 21, 1959, Hawaii is a large archipelago of volcanic origin lying in the Pacific Ocean 2,090 nautical miles southwest of San Francisco. The "Aloha State" constitutes the newest and southernmost of the United States and (as of January 1962) ranks 43d in population (631,682 residents, not including some 59,000 military personnel) and 47th in area (6,415 square miles of land and 9 of inland water).

Area and Population.—The eight major islands of the state and their areas and populations are as follows:

Island	Land area (sq. mi.)	Population (Jan. 1962)
Hawaii	4,021	61,487
Maui	728	34,266
Oahu	589	500,337
Kauai	551	27,708
Molokai	259	5,336
Lanai	141	2,289
Niihau	72	259
Kahoolawe	45	0

Honolulu (1962 est. pop., 317,890), on Oahu, is the capital, largest city, and principal port. Other unincorporated places of more than 10,000 population (1960) are: Hilo, 25,966; Kailua-Lanikai, 25,622; Wahiawa, 15,512; Kaneohe, 14,414; and Aiea, 11,826.

The population is of diverse racial extraction and is characterized by a high ratio (about one third) of intermarriages between the various ethnic stocks. Persons of Japanese and Caucasian origin (each about 33%) constitute the two largest groups; others include Hawaiians, Chinese, Filipinos, Koreans, Puerto Ricans, and Samoans. Approximately 97% of the entire population are United States citizens. It is a young population (median age of 24, compared with 30 for the mainland) with a preponderance of men (53%).

In addition to the eight major islands listed above, the state includes the Leeward Islands (except Midway), a chain of small islands, shoals, and reefs extending some 1,250 miles northwestward from Niihau and forming the Hawaiian Islands Bird Reservation, uninhabited (except for a few Coast Guard and other official personnel). The Leeward group includes the following: Nihoa, Necker, French Frigate Shoal, Gardner Pinnacles, Maro Reef, Laysan, Lisianski, Pearl and Hermes Reef, and Kure (or Ocean) Island. Other small bodies of land within the archipelago which may be exposed at low tide are deemed part of the state.

Palmyra Island (area about 1 square mile), formerly part of the Territory of Hawaii, was excluded from the jurisdiction of the state under the statehood act.

Government.—Hawaii's constitution (1959) provides for the election of the governor and lieutenant governor (not necessarily of the same political party) for four-year terms. All other state officers are appointed.

The Hawaii Legislature comprises a Senate of 25 members (15 Democrats and 10 Republicans) serving four-year terms, and a House of Representatives of 51 members (40 Democrats and 11 Republicans) serving two-year terms, elected on Nov. 6, 1962 (see below, *Events, 1962*). It convenes annually starting on the third Wednesday in February—for regular sessions in odd-numbered years and for budget sessions in the alternate years.

The state's judiciary is headed by a 5-member Supreme Court and also includes 11 Circuit Court judges and a tax appeals court, all appointed by the governor, and district court magistrates, appointed by the chief justice of the Supreme Court. Hawaii is in the 9th District of the federal court system.

Chief state officers in 1962 were William F. Quinn (Republican), governor; James K. Kealoha, lieutenant governor; Shiro Kashiwa, attorney general; R. Burl Yarberry, superintendent of public instruction; Lawrence H. Kam, director of budget and review; and Wilfred Tsukiyama, chief justice of the Supreme Court.

The only major units of local government are the three counties of Maui, Kauai, and Hawaii, and the city-county of Honolulu, each governed by an elected board (and, in Honolulu, by a mayor).

Legislation, 1962.—The first state legislature met in a limited (budget) session between Feb. 23 and April 17, 1962. Thirty-two bills were enacted (none vetoed), including the following measures: revision of the laws governing state-owned land for the first time in 40 years; reduction of taxes on sugar and pineapple production; increase in minimum wages to $1.15 and on Jan. 1, 1964, to $1.25 per hour; and financing of Hawaii's participation in the New York World's Fair of 1964–65. A record appropriation—$116.7 million for the general fund budget, $66.5 million for capital improvements—stressed increased expenditures for education. Funds were appropriated for the retraining of persons deprived of employment in rural areas of the state, recognizing the continued movement of population to Honolulu.

Finance.—Hawaii has a centralized system, wider in scope than most mainland states. Chief revenue sources are the general excise (a comprehensive turnover) tax; personal and corporate income taxes; gasoline, liquor, and tobacco taxes; and a real property tax collected by the state for the counties. The net assessed valuation of real property for the calendar year 1962 was $2,146 million. The average property tax was $14.06 per $1,000 of assessed value.

During the fiscal year ended June 30, 1962, state receipts to the general fund totaled $163 million, and payments totaled $167 million. State bonded indebtedness was $179 million on June 30, 1962; the general fund then had a balance of $10 million.

Education.—Expenditures for public education during the fiscal year 1962 approximated $50 million for a program administering to 215 public schools with an enrollment of 149,554 and a teaching staff of 6,514. Fifty-six private schools enrolled some 31,000 pupils.

Five colleges were in operation in 1962, four on Oahu and one on the island of Maui. The University of Hawaii, a land-grant college (founded 1907), with campuses at Honolulu and Hilo, had a student enrollment of 10,229.

Public Assistance.—During the fiscal year 1962 the state Department of Health and Social Services expended $9,888,000, exclusive of administrative costs, for public assistance programs. Slightly less than half of these costs was borne by the federal government.

Labor.—The civilian labor force for all industries in August 1962 was estimated to be 256,110. Aside from workers on sugar and pineapple plantations, agriculture employed 9,760 persons. Manufacturing of food, textiles, chemicals, and other nondurable goods gave employment to 23,430. Wholesale and retail trade employed 44,820, and services, 30,740.

The largest single employer in the state, the federal government, employed 25,580 civilians plus approximately 59,000 military personnel as of August 1962. In the same month, 23,890 persons were employed by state and county governments. In all, government jobs comprised about one fifth of total employment.

Unemployment in 1962 averaged about 4½% of the labor force. Unemployment benefit payments in the fiscal year 1962 aggregated $13,961,000. Uniquely among the states, Hawaii's employment security program has included agricultural workers since 1957.

Industry.—The production of cane sugar and the production and processing of pineapple, both highly mechanized, are the two most important industries in Hawaii. The combined value of these two crops in 1961 ($145 million for sugar and $117 million for pineapple) constituted about 80% of total agricultural income. In 1961, 227,000 acres of sugarcane were cultivated, producing 1,092,000 short tons. During 1962, 27 plantations and about 2,000 independent planters employed some 13,500 year-round workers. For the crop year ending May 1961, pineapple products totaled 30,759,000 cases of canned fruit and juices. The industry provides year-round employment for about 9,000 persons, with some 21,000 on the payroll in the summer canning season.

Diversified agriculture (including coffee, macadamia nuts, papayas, bananas, livestock, milk, and fisheries) produced an aggregate product of about $44 million in 1961.

A rapidly expanding tourist industry in 1961 brought to Hawaii 319,422 visitors who spent about $140 million in the state. Some 365,000 tourists were estimated for 1962.

Construction leveled off from the record highs of the post-statehood boom. The value of com-

pleted buildings and other improvements approximated $269 million in 1961 and was estimated at $230 million for 1962. Most of the state's mineral output, valued at $14.6 million in 1961 (up from $9.3 million in 1960), comprises sand, gravel, and stone used in domestic construction. The first full year of portland cement production, at new plants on Oahu, accounted for the increase.

Economic Level and Balance of Payments.—Hawaii's gross product (aggregate value of all goods produced and services rendered) in 1961 was estimated at $1,800 million. Personal income totaled $1,545 million, with per capita income amounting to $2,407, an average which ranked Hawaii 11th among the states.

The state in 1961 experienced an almost even balance of payments in trade with the mainland United States and other areas. Income from without the state approximated $1,084 million; expenditures going outside the state, $1,076 million. Federal expenditures, mostly military, amounted to $530 million, or almost half of the mainland dollars received by the state's economy. Payments (tax and other) to the federal government totaled $278 million.

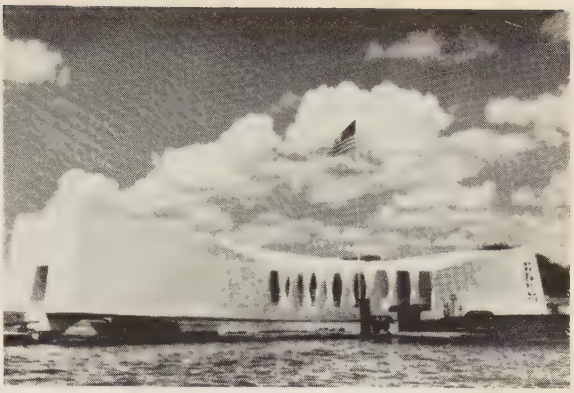
Transportation and Communications.—Honolulu is a regular port of call for several steamship lines, connecting the islands with the United States mainland and with Canada, Australia, New Zealand, the Philippines, Taiwan, Japan, Samoa, Tahiti, and Fiji. Other deepwater ports are Hilo and Kawaihae (Hawaii), Kahului (Maui), and Nawiliwili (Kauai). During 1961, 1,518 overseas vessels entered the ports of Hawaii with 4,168,411 tons of cargo and cleared with 1,289,723 tons. Freighters and barges provide transportation between the islands of Hawaii, but almost all passenger travel (926,000 interisland trips in 1961) is by air. Seven major and four supplemental airlines connect Hawaii with the United States and foreign nations, carrying 1,692,742 passengers to and through Hawaii in 1961.

In 1962 approximately 250,000 motor vehicles were locally registered. Interisland communications, as well as communications with the continental United States, are facilitated by radiotelephone service. Wireless telegraph service is maintained between the six largest Hawaiian islands, and underseas cables connecting Point Reyes, Calif., and Oahu provide telephone connections to the mainland of North America.

Other communications facilities in 1962 included some 230,000 telephones, 18 radio stations, and 4 television stations in Honolulu, with 4 satellite stations on other islands. Six daily newspapers are published in Honolulu (2 in English, 2 in Chinese, and 2 in Japanese and English); the other three counties are each served by one English-language newspaper. Thirteen other newspapers and 20 magazines were published in the state in 1962.

Events, 1962.—The November 6 elections brought a Democratic sweep of all major public offices for the first time in Hawaii's history. Congressman Daniel K. Inouye was elected to the U.S. Senate, the first person of Japanese ancestry to serve in that body. Spark M. Matsunaga and Thomas P. Gill were elected to the national House of Representatives. John A. Burns and William S. Richardson became governor and lieutenant governor, respectively, supported by large Democratic majorities in both houses of the state Legislature.

Construction was begun in October on "Magic Island," an area of some 200 acres to be formed on the coral reefs lying eastward of Waikiki in Honolulu. When completed in about six years, Magic Island will provide space for hotels and other facilities used by vacationers, as well as public beaches for Honolulu's rapidly growing population.



UPI

Memorial to the U.S.S. *Arizona* in Pearl Harbor, Hawaii, is shown on Dec. 7, 1962, 21 years after the ship went down with more than 1,100 sailors in the Japanese surprise attack.

Thomas H. Hamilton, president of New York State University, was selected in August to head the University of Hawaii. Anthropologist Alexander Spoehr was appointed first chancellor of the federally supported Center for Cultural and Technical Interchange between East and West (East-West Center) at the university. The first buildings of the center were completed at the close of 1962.

HEALTH INSURANCE. See INSURANCE.

HEART DISEASE

The recorded mortality from heart disease in the United States has increased somewhat in the past decade, but statisticians of the Metropolitan Life Insurance Company point out that the rise reflected merely the growing proportion of older people in the population.

Recent studies of the lungs of cigarette smokers have shown tissue changes which may place an increased load on the heart while curbing its oxygen supply; these lung changes may explain the higher death rate from coronary disease reported in cigarette smokers. The U.S. Public Health Service announced that an advisory committee would make a scientific study of the effects of tobacco on health.

In 1962 much new information was reported about heritable types of congenital heart disease. Studies of the chromosomes have shown abnormalities which frequently accompany certain types of congenital heart disease. Either too many or too few chromosomes, or an abnormality in their structure, may be responsible for the defects.

There is still much controversy over the effects of diet in causing hardening of the arteries. A current large-scale study of the dietary habits of thousands of Americans may help to solve this extremely important problem. At present there is insufficient evidence to justify general recommendation of radical changes in dietary pattern of fat intake, although most heart specialists believe that "unsaturated" fats derived from vegetables and fish are preferable to "saturated" fats of animal origin. There is unanimous agreement that overweight predisposes individuals to heart disease. A diet low in fat is now considered by most cardiologists more important than a diet low in cholesterol in reducing the blood cholesterol levels.

Sudden death has been reported in children

with impaired oxygen uptake secondary to upper respiratory infection. These deaths are due to hemorrhage in the specialized conduction tissue in the heart, which transmit the waves causing the heart beat.

Remarkable progress has been made in the treatment of attacks of rapid heart action which respond unfavorably to drug treatment. The attacks have been successfully terminated by the application of high-voltage electrical countershock applied for a fraction of a second to the chest over the heart. Both alternating and direct current have been used.

Triparanol (MER 29), a drug which can reduce cholesterol level of the blood, has been withdrawn from the market because loss of hair, severe skin eruptions, and occasional cataracts have occurred in a small number of patients taking this medication.

Anticoagulants.—Over the past 15 years there has been widespread use of anticoagulants (blood-clotting inhibitors) in treatment of patients with heart attacks due to acute coronary artery occlusion. The effectiveness of this treatment has been questioned in a recent report from four large municipal hospitals in Copenhagen; the authors concluded that "anticoagulant therapy is not indicated in acute myocardial infarction." Their conclusions have been challenged by the majority of cardiologists in the United States, who believe that, following heart attacks, anticoagulant treatment prevents clots from being formed and dislodged to obstruct the arteries supplying vital organs. They concede that mortality from heart attacks and recurrences are reduced by the use of anticoagulants only when good laboratory facilities are available to measure the effect of these drugs, since too great lowering of the blood-clotting mechanisms may cause hemorrhage and too little decrease in these factors is valueless.

Surgical Treatment.—Brilliant advances continue to be made in cardiac surgery with improved techniques for the substitution of artificial valves, or valves removed from healthy individuals following accidental death, for badly damaged aortic and mitral valves of the heart. Many patients incapacitated by severe heart failure have been restored at least temporarily to essentially normal activity. However, these operations are frequently dangerous, and it is still unknown how long the replacement materials will continue to function.

Direct surgical attack on occlusion of coronary arteries has proved disappointing because of high operative mortality and frequent failure of vessels to remain open. An interesting new experimental approach to coronary artery disease includes grafting into the aorta a third coronary artery in order to bypass an occluded area.

William J. Kolff of the Cleveland Clinic has developed an artificial heart which can replace a dog's heart successfully for as long as ten hours. The reasons for subsequent deterioration and death of the animals have not been clarified. Whether such mechanical hearts can be improved technically so that they can be of practical use in man is still speculative.

New evidence suggesting that the thymus gland is possibly the master organ in the development of immunity may eventually make possible transplantation of such organs as the kidney and heart from one individual to another. Successful organ transplants at the present time are possible only in identical twins.

JOHNSON MCGUIRE, *Director, Cardiac Laboratory, and Professor of Medicine; and* ARNOLD IGLAUER, *Assistant Professor of Medicine, College of Medicine, University of Cincinnati.*

HIGHWAYS

Highway expenditures in the United States again reached new levels in 1962. Estimates indicate that $11.38 billion was spent during the year on all levels of government for improvement, maintenance, highway police, administration, and interest on highway debt of the nation's roads and streets. Of this total, capital outlay accounted for $7.30 billion, including $5.65 billion for construction and $1.65 billion for preliminary engineering and planning and for right-of-way purchases. This capital outlay involved the improvement of 29,000 miles of principal highways at a cost of $5.57 billion and of 69,000 miles of local roads and streets at a cost of $1.73 billion.

There are 3,698,000 miles of roads and streets in the United States. Motor vehicle registrations in 1962 were expected to reach 78.6 million, 3.7% above the previous year. Total highway travel in 1962 was expected to be about 767 billion vehicle-miles, a gain of 4% over 1961.

Federal-Aid Program.—Federal aid to the states for highway improvement is administered by the Bureau of Public Roads, U.S. Department of Commerce. The program is a cooperative one, with the states doing the actual work and retaining responsibility for the roads and their maintenance.

A major objective of the federal-aid program is completion by 1972 of the National System of Interstate and Defense Highways. This 41,000-mile network of controlled-access superhighways will serve practically every city of 50,000 or more inhabitants, and many smaller towns. It is designed to handle adequately the traffic anticipated in 1975, when over 100 million motor vehicles will be traveling more than a trillion miles a year. The federal government is paying 90% of the $41 billion cost of the Interstate System. The safety features of the system are expected to save 5,000 lives a year in 1972.

In the older, continuing so-called "ABC" federal-aid program for the improvement of primary highways, secondary roads, and arterial streets, federal funds are matched evenly by the states. The networks eligible for federal aid in 1962 totaled 879,539 miles, of which 266,344 miles were in the federal-aid primary system of main rural roads and major streets (including the Interstate System mileage), and 613,195 miles in the federal-aid secondary system of farm-to-market and feeder roads. Urban portions of these systems totaled 40,823 miles.

Federal-aid funds authorized by Congress are apportioned among the states according to methods prescribed by law. The accompanying table shows the apportionment of funds for fiscal year 1964. The $3.55 billion total includes $2.6 billion for the Interstate System and $950 million for the regular ABC federal-aid program.

Federal funds for the federal-aid highway program come from a special highway trust fund in the U.S. Treasury. The money for this fund comes wholly from certain federal highway-user taxes, the principal one being the motor-fuel tax. Net revenue of the trust fund in the fiscal year 1962 was $2.96 billion.

Federal-Aid Work in 1962.—By June 30, 1962, a total of 12,550 miles of the Interstate System were open to traffic. This included 7,225 miles completed to the ultimate standards for 1975 traffic needs and 3,024 miles improved at least to capability for handling current traffic but needing

APPORTIONMENT OF FEDERAL-AID HIGHWAY FUNDS AUTHORIZED FOR THE FISCAL YEAR 1964

further work to reach 1975 standards. Toll roads, bridges, and tunnels totaling 2,301 miles are included in the system, as permitted by law, but no federal aid is spent on such facilities.

During the fiscal year 1962, 1,675 miles of the Interstate System were completed to the 1975 standards. Work accomplished on the system during the year cost $1.79 billion, of which $1.59 billion was in federal aid. Construction was under way at the end of the year on 4,801 miles; preliminary engineering and planning and right-of-way acquisition was in progress on another 10,927 miles. Projects under way at the close of the year were estimated to cost $6.78 billion.

In the ABC federal-aid program, improvement projects were completed during the year on 18,375 miles of roads and streets at a cost of $1.48 billion, of which $796 million was federal aid. At the end of the year work was under way on 25,477 miles at an estimated cost of $3.58 billion.

In addition to administering the federal-aid program, the Bureau of Public Roads builds roads in national parks and forests and other public lands. During the fiscal year 1962, projects were completed on 695 miles of such roads at a cost of $57 million in federal funds. At the close of the year, work was under way on 1,593 miles of roads at an estimated cost of $169 million.

Research and Planning.—During 1962 the Bureau of Public Roads intensified its activities in research and planning. A major accomplishment of the year was completion of the $27 million American Association of State Highway Officials (AASHO) Road Test, sponsored by the Bureau of Public Roads, the states, and others. The results of the test will aid in development of scientific structural design methods for highway pavements.

The problems of urban transportation were the subject of a joint report to the president by the Department of Commerce and the Housing and Home Finance Agency (HHFA), which formed the basis for part of the president's transportation message of April 5, 1962. At the president's request, Congress enacted legislation providing that, beginning in 1965, approval of federal-aid highway programs in metropolitan areas will be contingent on their consistency with the results of a continuous, cooperative planning process being carried on by the state and the local communities.

The Bureau of Public Roads and HHFA joined with the national organizations of city, county, and state highway officials during 1962 in launching a long-range program to initiate urban transportation planning studies in every city in the country. (See also URBAN TRANSIT.)

Safety.—In 1962 the president established an Interdepartmental Highway Safety Board, comprising the heads of seven major federal agencies, to provide leadership for a national highway safety program. The Bureau of Public Roads established the Office of Safety to intensify its activities in this field. The bureau's driver register service, inaugurated in 1961, reported to the states on 5,700 persons who were applying for new state driver's licenses and had lost their licenses in another state for drunken driving or conviction of a violation involving a traffic fatality.

View of upper Manhattan shows intricate configuration of approach roads to the George Washington Bridge over the Hudson River.

PORT OF NEW YORK AUTHORITY

The Inter-American Highway.—Since 1930 the United States, through the Bureau of Public Roads, has aided the six Central American republics in building the 3,142-mile Inter-American Highway from Laredo, Texas, to Panama City, Panama. Completion of 39 bridges in Costa Rica late in 1962 was scheduled to close the last gap in the route. Paving was under way at a number of locations. Plans were being made to survey a route through the Darien Gap jungle in the Isthmus of Panama for a highway linking North and South America.

Foreign Assistance.—The Bureau of Public Roads has assisted many countries in the establishment of highway departments and highway programs since World War II. Such work is financed by the Agency for International Development (AID) or by loans from the Export-Import Bank of Washington or the World Bank. During the fiscal year 1962 the Bureau of Public Roads had missions in 15 countries. The bureau also arranged study programs in the United States for 221 highway officials from 50 countries.

HOME, Earl of (Alexander Frederick Douglas-Home)

British foreign secretary: b. London, England, July 2, 1903.

Retained as foreign secretary by Prime Minister Macmillan during the July 1962 reorganization of the cabinet, Lord Home became a leading exponent of the British policy which emphasized the need to work out a modus vivendi on the status of Berlin. In 1962 much of his effort was spent in an attempt to formulate a united approach to the Berlin problem with the United States, France, and West Germany.

Educated at Eton and Christ Church, Oxford, he represented South Lanark and Lanark in the House of Commons (1931–45, 1950–51), acting also (1937–39) as parliamentary private secretary to Neville Chamberlain. He was elevated to the House of Lords in 1951, and became its leader in 1957. He was also minister of state for Scottish Affairs (1951–55) and secretary of state for Commonwealth relations (1955–60). He was appointed foreign secretary on July 27, 1960.

In an attempt to bring about an agreement with the Soviet Union on the future of Berlin, Lord Home participated in a series of ministerial parleys in 1962, beginning with the foreign ministers conference (March 11–22) in Geneva. Later, on September 30, he conferred with President Kennedy at the White House on this question. He stressed the desirability of arriving at a temporary arrangement, but advocated German self-determination as the only permanent solution of the Berlin question. His efforts to bring about the neutralization of Laos came to a successful conclusion when he participated on July 23 in the signing of the Geneva pacts guaranteeing that country's independence and neutrality, after a civil war which had been going on since 1960.

Lord Home survived the major reorganization of the Macmillan government on July 16, 1962. Earlier, in February, a motion of censure by Labour Party leaders for his criticism of United Nations "double standards," was defeated in the House of Commons by 326 votes to 228.

His duties as foreign secretary also took him to the 17-nation disarmament conference (Geneva, March 11–27), and the councils of CENTO (London, April 30–May 1), NATO (Athens, May 4–6; Paris, December 13–15), and SEATO (New York, September 29). He also headed the British delegation to the UN General Assembly in the fall, and accompanied Prime Minister Macmillan to a meeting with President Kennedy (December 18–21) in the Bahamas.

HONDURAS

This Central American republic is bounded on the northwest by Guatemala, on the southwest by El Salvador and the Pacific Ocean, on the south by Nicaragua, and on the east and north by the Caribbean Sea. The area, more than 80% of which is mountainous and forested, is 43,277 square miles; and the population (1961 census), 1,883,173 (1962 est., 1,939,300). The capital, Tegucigalpa (elevation about 3,200 feet) has a population of 129,540 (1962 est.). San Pedro Sula has a population of about 77,000 (1962 est.). Other important cities (with 1962 est. pop.) are: La Ceiba (46,800), Santa Rosa de Copán (20,800), and Choluteca (20,850). Official data reveal ethnic distribution to be as follows: mestizos, 91%; Indians, 6%; Negroes, 2%; and whites, 1%.

Government.—Honduras is a unitary state with a presidential structure in the central government which exercises great control over the departmental and local units. There are 278 municipalities. Governed under the constitution of 1957, Honduras has a president (Dr. José Ramón Villeda Morales, a Liberal, elected in 1957 for a 6-year term); 3 presidential designates elected by congress; a 58-member single-chamber Congress of Deputies elected by popular vote for a 6-year term; and a 5-man Supreme Court elected by the congress for a 6-year term. Congress is constituted as follows: Liberals (36), Nationalists (18), and Reformists (4). Administration of the country's 18 departments is conducted through governors appointed by the president.

Education and Religion.—Honduras, with the aid of the United Nations Educational, Scientific and Cultural Organization (UNESCO), showed a 40% increase in enrollment in elementary education in the years 1957–60. In 1962, the Agency for International Development (AID) approved a $1.2 million allocation (one half of the amount a 40-year, no-interest loan, the other half a gift) for the construction of 96 school buildings. Public education was allocated 16,505,385 lempiras in the 1962 budget (about 16% of the total), as compared with 14,739,360 lempiras in 1961. However, probably at least 40% of the children do not attend any kind of school, and illiteracy of those 10 years of age and over is estimated at about 60%. The only institution of higher learning, the National University of Honduras, at Tegucigalpa (with a branch in San Pedro Sula) had about 1,300 students in 1962. The Pan American School of Agriculture at Zamorano graduated 632 students from 1946 to 1959.

Although over 95% of the population is nominally Roman Catholic, the 1957 constitution recognizes divorce and provides that members of the hierarchy may not hold elected public office.

Finance.—The budget for 1962 set expenditures at 100,441,599 lempiras (2.02 lempiras equal U.S.$1), compared with 93,772,988 in 1961. Debt service for 1962 was 10,985,610 lempiras, or 10.9% of the budget. Receipts of the central government, excluding borrowings, amounted to $20.4 million during the first 6 months of 1962, suggesting another budgetary deficit for the year. From March 3, 1961, to Feb. 28, 1962, Honduras received $5,076,000 in Alliance for Progress aid.

Transportation and Communications.—Inadequate roads have long retarded economic progress in Honduras. The largest single item in the 1962 budget was for transportation and communication (27,016,214 lempiras, 23.3% of the total). However, there are only about 100 miles of paved roads in the entire country, and less than 1,000 miles of roads in use. The Inter-Oceanic Highway crosses the country from north to south, but parts of it are passable only in dry weather. The International Development Association in 1961 extended a 50-year, $9 million interest-free credit to assist in a $13.5 million highway development and maintenance project. The Inter-American Development Bank also approved a $2.5 million loan for the project, in addition to a loan of $960,000 for highways and air transport.

The government operates a small railway of some 60 miles which runs from Puerto Cortés to Potrerillos. The United Fruit Company owns two railroads and the Standard Fruit Company one, which service mainly the banana industry. A total of about 580 miles of railroad are in use. Ships call at Puerto Cortés and La Ceiba on the Atlantic coast and at Amapala on the Pacific coast. Only Toncontín airport in Tegucigalpa meets international standards among Honduras' 30 airfields.

The government's domestic telephone service covers the most important population centers, with 5,862 telephones in use in 1960. There are 17 radio stations and a television station in Tegucigalpa; radios numbered 72,000 in 1959, television sets 2,000 in 1960.

Economic Indicators.—Gross national product, 1960: $389.5 million; national income, $334.55 million. Index of agricultural production in 1961 (1952–7 = 100): 112 (110 in 1960); cost of living index in 1961 (1958 = 100): 101 (99 in 1960).

Manufactures and Minerals.—Although richer in minerals than any other Central American country, Honduras lacks the iron and coal for heavy industry. Light industry developed rapidly after World War II but later flagged. The Lake Yojoa hydroelectric project was scheduled to be finished by 1963 and to supply 30,000 kilowatts to the north and central zones. Silver is the chief mineral resource; the value of exports in 1960 was over $3 million. The only other minerals being exploited, lead and zinc, each had an export value of about $1.4 million in 1960.

Agriculture.—About 83% of the population is engaged in agriculture. A new agrarian law which took effect in 1962 permitted the government to impose heavy taxation on uncultivated land, expropriate private property (when no state property is available or where the National Agrarian Institute has an otherwise insoluble problem in distributing land), and plan agricultural diversification. Banana exports of the United Fruit Company for the first 6 months of 1962 declined 40% from the same period in 1961, due to the blowdown in late 1961 and the loss of 4,000 acres to Panama disease. The total production of the United Fruit Company for 1962 was estimated at 6.5 million stems, or 24% less than in 1961. The company planted 5,600 acres of the disease-resistant Valerey strain in 1962. The Standard Fruit Company had exported 3.6 million boxes of bananas by May 18, 1962, an increase of nearly 20% over the same period in 1961.

Although prices for coffee were off 3 to 4 cents per pound, an estimated 20% increase in volume over the 217,000 bags exported in 1961 increased the total export value for 1962. An estimated 16,736 bales of cotton were produced in 1962, compared with 5,201 in 1961. The value of the crop was placed at about $2.28 million, with cotton seed estimated at $400,000. The tobacco crop in 1961 rose to 7.5 million pounds from 5 million in 1960. Successful pilot plantings of Havana-type wrapper leaf tobacco in 1961 led to expansion in 1962. On Sept. 3, 1962, the Inter-American Development Bank announced a loan of $2,500,000 to help raise agricultural productivity; $2 million was to be used to extend credits to low-income farmers, and the rest to construct silos and purchase small machinery.

Foreign Trade.—Total imports, 1961: $72 million ($71.8 million in 1960); exports: $72.9 million ($63.05 million in 1960). The rise in exports was due largely to the increase in banana shipments, more than offsetting sales drops in coffee and lumber. Banana exports totaled $33.3 million in 1961 ($28.7 million in 1960); coffee, $9 million ($11.8 million); lumber, $7.5 million ($8.2 million). The United States is the principal trading partner.

Events, 1962.—The influence of Castroism among students, faculty, and labor unions, mainly in the banana-producing areas of the north coast, along with early preparations for the 1963 presidential elections, produced political unrest and sporadic violence during the year. The National University was plagued with student disorders, some Communist led. On September 18, President Villeda Morales declared in Tegucigalpa that Castroism was a cancer which must be removed from the Western Hemisphere as soon as possible by whatever means necessary.

Honduras was host to the successful "Operación Fraternidad" (September 4–5) in which the United States, Guatemala, Honduras, Nicaragua, El Salvador, and Colombia defended Tegucigalpa from mock invaders. The exercise was part of the program of defense against infiltration.

At San Pedro Sula, an epidemic of gastroenteritis killed over 100 children in May and June.

President Villeda Morales, while on a visit to the United States, discussed economic and political matters with President Kennedy in Washington on December 1.

WILLIAM S. STOKES,
Senior Professor of Comparative Political Institutions, Claremont Men's College.

HONDURAS, British. See BRITISH HONDURAS.

HONG KONG

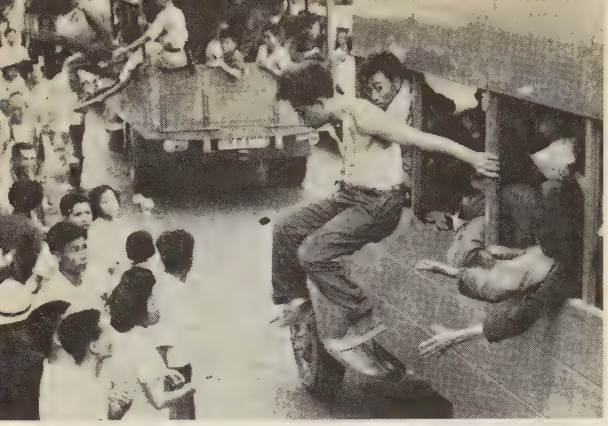
Under British sovereignty since 1841, the crown colony of Hong Kong consists of numerous small islands off the southeastern coast of China and a small strip of China's Kwangtung Province. With a total land area of 398¼ square miles, it comprises the island of Hong Kong (29 square miles), on which is located Victoria, the capital; the New Territories (365½ square miles), leased from China in 1898 for 99 years; and Kowloon and Stonecutters Island (aggregate area, 3¾ square miles), ceded by China in 1860. The total population is 3,226,400 (1962 est.); the non-Chinese population is 49,747, mainly British. The great majority of the people live in Victoria and Kowloon. English is the official language; Chinese is the principal spoken language. A major seaport, Hong Kong serves also as the main point of contact between the free world and Communist China.

Government.—The administration is in the hands of a governor (Sir Robert Black, who took office in 1958), assisted by a 13-member Executive Council and a 19-member Legislative Council.

Education.—About half of the school-age population attends school; schooling is not compulsory. Number of primary and secondary schools, 1962 (with enrollments): 1,993 (685,728). Higher education is provided by the University of Hong Kong (1,596 students) and the Tech-

Returning to Communist China on May 23 after unsuccessful attempt to settle in Hong Kong, refugees reach out for food thrown onto truck by citizens of Hong Kong.

JP



WIDE WORLD

Resident of Communist China, being returned from Hong Kong, May 19, leaps from bus in bid for freedom. Mass exodus to Hong Kong was halted because of overcrowding.

nical College (7,945). About 1,000 primary school teachers are prepared annually by Northcote, Grantham, and Sir Robert Black teacher-training colleges.

Finance.—Government revenue, fiscal year 1962: HK$1,030,447,880 (HK$859,234,131 in fiscal 1961); expenditure, HK$953,205,237 (HK$845,297,629). The Hong Kong dollar (HK$) equals U.S.$0.175.

Transportation and Communications.—Transport networks (miles, 1961): railroad (Kowloon to Shumchun, China) 22; roads, 524. Merchant marine tonnage, 1961 est., 601,000. Ship arrivals, fiscal 1962: 37,062 vessels (tonnage, 40,048,760); passengers, 1,119,406. Principal airport: Kai Tak, served by 22 international airlines. Other data for 1960: passenger cars, 32,500; commercial vehicles, 9,600; radio receiver licenses, 165,000; television set licenses, 7,000; and telephones, 126,000 (1961).

Economy.—In 1961 the industrial labor force comprised 271,729 workers, of whom 25% were engaged in textile manufacturing. Other major industries were shipbuilding and repairing, iron foundries, and rolling mills. Private building construction was valued at HK$271 million in 1961 (HK$273 million in 1960). Chief subsistence crops (metric tons, 1961): vegetables, 116,464 (91,076 in 1960); rice, 20,326 (18,647). Hong Kong's fishing fleet, largest of any port in the Commonwealth, comprised 9,980 vessels in 1962. Tourists numbered 138,235 in 1961 (163,500 in 1960).

Manufactures and Minerals.—Chief manufactures for export, with 1961 values: clothing, HK$862 million (HK$1,010 million in 1960); textiles, HK$669 million (HK$554 million). Principal minerals (metric tons, 1961): iron ore concentrate, 119,242; kaolin, 8,565; quartz, 4,110; graphite, 1,227; feldspar, 1,225; wolframite, 17. Cement production (1961): 185,000 metric tons (up 23% from 1960); electricity, 1.3 billion kw.-hr. (up 16%).

Foreign Trade.—Total exports, 1961: HK$3,930 million (down 0.2% from 1960); imports, HK$5,970 million (up 1.8%). Textiles and clothing account for about half of total export value; chief imports are food, textile fibers, yarn, fabrics, base metals, machinery, building materials, and pharmaceuticals. The United States remained the colony's principal customer in 1961, receiving 23% of Hong Kong's exports; Great Britain took 20%. Communist China continued in 1961 as Hong Kong's chief supplier, providing 17% of total imports (mainly foodstuffs); other important suppliers were Japan, Great Britain, and the United States.

Events, 1962.—In March the Hong Kong government imposed export controls on the textile industry in response to a request from the United States to keep textile exports at the 1961 level. The quota system on cloth and clothing exports to the United States went into effect on April 1. This action forestalled imposition of tariffs by the United States on Hong Kong's low-priced clothing exports. Fears were expressed by the Hong Kong business community as to the effect of the export restrictions on the economy, as well as the effect of Great Britain's proposed entry into the European Common Market.

In May there was a sudden increase of illegal immigration into Hong Kong from Communist China. It was estimated that 70,000 Chinese attempted to enter the colony during the month. About 60,000 were apprehended and returned to China. The government explained that it had accepted about 1 million refugees from China during the preceding 12 years, and that it was unable to accept any significant number without disrupting the life of the colony. Toward the end of May, Chinese Communist frontier guards began again to intercept refugees, although the regular flow of refugees continued. It was estimated that about 70,000 Chinese entered the colony in the year 1961. (See also China; Refugees and Displaced Persons.)

In an effort to ease the situation, President Kennedy announced on May 23 that the United States would expedite the admission of "several thousand" Chinese refugees outside of the regular annual immigration quota of 105. On July 26 the first group of 43 refugees arrived in San Francisco. Nationalist China also offered to help solve Hong Kong's refugee problem by accepting all Chinese refugees who wished to come to Taiwan. On June 25 the first group of 65 refugees sailed to Taiwan.

On September 2 a typhoon struck the colony, leaving more than 100 dead and 500 injured.

HORSE RACING. See Sports, Games, and Shows.

HORTICULTURE AND GARDENING

Extensive horticulture is a $20 billion-a-year industry in the United States, based on retail value of commodities. Production of fresh and processed fruits and vegetables accounts for the major portion, followed by landscape plant usage, including turf and floral items. The landscape industry, including turf developments, in 1962 was an important part of the $50 billion outdoor recreation activity. The number of golf courses in the nation has increased to an all-time high of about 7,000. In addition, popular interest in home gardening and community beautification is resulting in much increased activity.

Fruits and Vegetables.—Labor-saving devices were being improved for fruit and vegetable harvesting, especially for processing. The University of Arizona was developing mechanical harvesting of head lettuce, and released a commercial type of head lettuce, Sunbright, which is resistant to tipburn. Appropriate varieties for uniform maturity are being developed by plant breeders. Mechanized size selection of harvested cantaloupes and automatic packaging is being accomplished by industry developments. The potato, onion, and tomato industries continued to experience dramatic changes toward further mechanization of precision production, harvesting, and processing. In 1962, consumer acceptance of fruits and vegetables continued at a high level in relation to the trend of the American public demands for low-calorie salad diets.

The national citrus industry was rapidly expanding, and special emphasis was placed on processing juice concentrates. Breeding programs and better cultural management led to the development of improved citrus varieties of high nutritional value. More efficient cultural management of orchards was being accomplished by use of new herbicides and improved irrigation. Mechanical pruning was becoming more acceptable from the point of view of reduced labor costs.

Improvements in handling fresh table grape vineyards in the Southwest to improve the quality of Cardinals and Thompson Seedless grapes include the use of gibberellin and floral cluster tipping as developed by the universities of Arizona and California.

Chemical Advances.—The dramatic use of growth regulators in horticulture proceeded rap-

idly. More recent developments, including the use of growth retardants, such as phosfon, accompanied by cyclic lighting effects, paved the way for far-reaching horticultural applications with special reference to producing compact flowering and landscape plants. The application of maleic hydrazide proved effective in preventing sprouting of potatoes during storage. Intensive investigations revealed the role of phytochrome in controlling flowering with special reference to chrysanthemums. The University of Wisconsin was developing the use of anthogen, a natural lipid hormone, for earlier and more uniform flowering and fruiting.

Landscape Horticulture.—Home owners were becoming especially interested in using technical developments for better lawns. Crab grass control was accomplished by pre-emergency application of appropriate chemicals. Tifgreen Bermuda grass proved widely adaptable, and lawn breeding included development of dwarf types.

The usage of plastics in horticulture and gardening expanded rapidly with special reference to greenhouses, plant containers, mulching, and prepackaging of horticultural items.

Dwarf fruit trees for home gardens were developed by using appropriate rootstocks, interstocks, and genetically developed dwarfing characteristics designed for patio use and for portable planters. A new superior rootstock was developed for Florida rose culture. A breakthrough in the dwarfing phenomenon was accomplished by the U.S. Department of Agriculture by holding germinating peach seeds at 27°C. for a specified period. The peach seedlings thus become permanently dwarfed, a highly desirable characteristic in horticulture.

Landscape horticulture expansion was due especially to pressures of urbanization, the increase in leisure time for outdoor living, and the higher living standards of the American public. This expansion created new professional fields of endeavor in horticulture, resulting in specialized college and university training.

Due to the rapidly increasing home landscape developments, many garden centers and other informational headquarters have been developed and are contributing greatly to a better appreciation and understanding of landscape gardening. The rapidly increasing numbers of arboretums, parks, and golf courses contributed to healthier outdoor activities. Exchange of gardening information was being enhanced by the increasing number and expanding memberships in a wide variety of horticultural organizations.

The current dramatic interest in horticulture from the standpoint of the American public was enhanced by the development of new roses and other floral items. An attractive phase of home gardening is the newness of varieties resulting from hybridization.

New Horticultural Varieties.—Horticultural varieties are continually being improved by nurserymen, plant breeders and seedsmen. In 1962, more than 100 plant patents were issued, with new roses and chrysanthemums dominating the list. Many new varieties are evaluated by such organizations as the All-America Selections.

The All-America Rose Selections for 1963 are Tropicana and Royal Highness. Tropicana is a brilliant orange-red hybrid tea with wide adaptability. It had received 12 outstanding awards in Europe, under the name of Super Star, where it was developed by the well-known rose hybridizer Mathias Tantau of Germany. Royal Highness is a pink hybrid tea with long flowering stems, developed by Herbert Swim and O. L. Weeks.

All-America Selections of new garden flowers for 1963 included four gladioli—Frisky, Goldilocks, Morning Sun, and Victory; and two zinnias—Thumbelina, a dwarf, and Firecracker, a giant.

New garden vegetables chosen as All-America Selections for 1963 include Buttercrunch lettuce, developed in New York; Emerald Cross cabbage, a true hybrid developed in Japan; Hercules, a Butternut-type winter squash; Greyzini, an F_1 hybrid summer squash of the zucchini type; and Executive, a bush snapbean of the tenderbean type.

Awards, 1962.—Horticulture awards presented in 1962 included the following:

American Association of Nurserymen's Norman Jay Colman Award: H. A. Borthwick, for light effects on horticultural plants.

American Horticultural Society: Liberty Hyde Bailey Medal to H. Teuscher of the Montreal Botanical Garden for his efficient design of a modern world-famous botanical garden for educational and scientific use.

American Society for Horticultural Science: Alex Laurie Award in Floriculture to M. Kawase of Purdue University; Joseph Harvey Gourley Award in Pomology to H. T. Hartman of the University of California; Leonard H. Vaughan Award in Vegetable Crops to K. Singh and B. D. Thompson of the University of Florida; Leonard H. Vaughan Award in Floriculture to H. H. Cathey and A. A. Piringer of the U.S. Department of Agriculture; Charles G. Woodbury Award in Raw Products Research to R. C. Wiley and G. E. Sternbridge of the University of Maryland.

LELAND BURKHART,
Professor of Horticulture, University of Arizona.

HOSPITALS

The 6,923 hospitals in the United States admitted 25,474,000 patients during 1961. Of these admissions 67% were to the voluntary, short-term hospitals, which comprised 48% of all hospitals but had only 27% of all hospital beds. Total expenses of operation incurred by all hospitals rose 11% in 1961, and total hospital beds increased by 12,000. Although 63% of the nation's hospitals had fewer than 100 beds, most of the patient-days of care were provided in the larger hospitals. The hospitals having over 100 beds accounted for over 77% of the nation's total hospital beds.

Trends in the utilization, financing, and staffing of hospitals are indicated by the accompany-

HOSPITAL STATISTICS

Category	All hospitals	Voluntary, short-term hospitals
Number of hospitals:		
1951	6,832	2,922
1961	6,923	3,305
Number of beds:		
1951	1,522,000	345,000
1961	1,670,000	458,000
Number of admissions:		
1951	18,783,000	11,946,000
1961	25,474,000	16,974,000
Average daily census:		
1951	1,298,000	257,000
1961	1,393,000	349,000
Percentage of occupancy:		
1951	85%	74.5%
1961	83%	76.0%
Number of births:		
1951	2,889,790	2,125,751
1961	3,908,121	2,774,299
Number of full-time personnel:		
1951	1,075,000	464,000
1961[1]	1,696,000	835,000
Full-time personnel per 100 patients:		
1951	83	181
1961[1]	122	240
Payroll expense:		
1951	$2,374,000,000	$ 953,000,000
1961	$6,225,000,000	$2,815,000,000
Payroll expense per patient day:		
1951	$ 5.01	$10.17
1961	$12.25	$22.13
Total expense:		
1951	$3,913,000,000	$1,688,000,000
1961	$9,387,000,000	$4,584,000,000
Total expense per patient day:		
1951	$ 8.26	$18.01
1961	$18.46	$36.04

[1] Includes full-time personnel plus full-time equivalents of part-time personnel. Excludes residents, interns, and students.

ing table, based on the August 1962 issue of *Hospitals,* the journal of the American Hospital Association.

Hospital Beds.—A marked increase has been shown in the proportion of the nation's hospital beds in voluntary short-term hospitals, which housed 21% of all hospital beds in 1946 and 26.9% in 1960. A corresponding drop of 5.7% was shown by the federal hospitals during this period, to 10.7% in 1960, while nonfederal long-term hospitals continued to comprise slightly over 50% of all hospital beds. The remaining 11.6% of beds are in state and local government or proprietary institutions.

Hospital Planning.—Health leaders have long recommended broad planning for hospitals as an essential part of a continuing voluntary hospital system. Rising operating and construction costs, shortages of facilities in some areas and excess facilities in others, obsolescence, and limitations of financial support provide mounting evidence that no single hospital can intelligently plan its future without considering the entire community it serves. Such "area-wide planning" would not only solve problems of bed distribution and duplication of services but would also help to develop interrelationships between the different services provided by hospitals, and related health facilities. In several states, legislation has been advocated necessitating public utility franchises for hospital enterprises.

Research.—Recent technological advances in electronics have made possible the development of "patient monitoring," the use of automatic equipment to observe and record important clinical information. Data such as the patient's blood pressure, pulse, or temperature are transmitted to an area where they can be recorded, observed, and compared with a range of expected readings. This information is provided on a constant, rather than a periodic, basis, and skilled personnel are released for other responsibilities.

Construction Trends.—Many general hospitals are adding psychiatric units to the already large number of services they offer. The numerous diagnostic facilities and specialists of the general hospital complex are thereby made easily available to the mental patient and his doctor. Also, patients are more apt to seek early treatment in a general hospital because there is less social prejudice attached to it and because it is usually located in the patient's community. Treatment of mental patients in general hospitals has proved so successful that the Veterans Administration has decided to use its general hospitals more extensively rather than build additional neuropsychiatric hospitals.

JAMES A. HAMILTON,
Hospital Consultant and Director, Program in Hospital Administration, University of Minnesota.

HOTELS AND MOTELS

Total sales in the United States hotel industry for the first nine months of 1962 showed no change from the same period in 1961. Room sales in the first nine months of 1962 equaled those in the same period of 1961; a rise of 1% in food sales was offset by a decrease of 1% in beverage sales.

In the first nine months of 1962, room rates averaged 1% higher than in the same period of 1962. This was offset by a decrease in average room occupancy from 63% in 1961 to 62% in 1962, the lowest level since 1941. Average occupancy has declined steadily from 80% in 1950.

The 1958 U.S. Census of Business showed a total of 29,203 hotels in the United States (including Alaska and Hawaii) with six or more rentable rooms. Annual gross receipts of hotels totaled $2,794,015,000. The 1958 census also showed a total of 41,332 tourist courts and motels, with annual gross receipts of more than $850 million.

Data for Canada in 1958 showed 5,088 hotels with receipts at a national record of $480,295,000.

The United States hotel industry itself tabulates only about 15,000 properties having 25 rooms or more. Fewer than 8,000 of these have over 50 rooms, and only slightly more than 800 have more than 300 rooms. In 1962, hotel directories listed 220 chain hotel and motor hotel companies, representing a total of 4,384 hotels and motor hotels having more than 483,985 guest rooms. Hilton Hotels Corporation, which owns, leases, operates under management contract 47 hotels with a total of 33,045 rooms, is the largest chain.

Expenditures for hotel construction in the first nine months of 1962 totaled $420 million, compared with $338 million in the same period of 1961. The 56 new hotels and 21 additions to existing buildings had a total of 23,174 rooms. Av-

First new hotel of more than 1,000 rooms in New York City in over thirty years was the Americana (*left*), which opened on September 24. (*Right*) Under construction in 1962, London's Hilton Hotel has 856 rooms.

LOEW'S HOTELS, INC.
CENTRAL PRESS

erage construction cost per room was $21,255 in new hotels, and $10,919 for new rooms in existing hotels.

Major new hotels opened in the United States during 1962 were the 50-story, 1,862-room Americana of New York (the first hotel of more than 1,000 rooms to be built in New York City since 1931), and the Americana of San Juan, Puerto Rico, both operated by Loew's Hotels, Inc.; the 500-room Sheraton-Lincoln in Houston, Texas; the Carriage House in Chicago; and the International Inn in Washington, D.C.

New hotels completed outside the United States in 1962 included the Sheraton-Kingston in Kingston, Jamaica; the Trinidad Hilton in Trinidad; the Amsterdam Hilton in Amsterdam, Netherlands; the Phoenicia Intercontinental in Beirut, Lebanon; Hotel Indonesia in Djakarta, Indonesia; and the Southern Cross in Melbourne, Australia. (The last three named are operated by Intercontinental Hotels Corporation.)

In an attempt to capture the mass travel market, the 68-hotel Sheraton Corporation of America launched a coast-to-coast chain of "tourist-class" Sherwyn hotels, which eliminate room service and dining rooms, and offer rooms for single occupancy at a maximum of $6.75 a night.

Continued success of franchise chains of motels or motor hotels, such as Holiday Inns of America and Howard Johnson Motor Lodges, has accounted for a large share of the motel industry's growth in recent years. In 1962, Sheraton became the first hotel chain to franchise motor hotels and resorts to operate under the chain's name, using its management techniques and reservation services.

Announced expenditures for new motel construction in the first nine months of 1962 totaled $143,248,000. This covers construction starts on 118 new motels and motor hotels with a total of 13,966 rooms, for an average per-room cost of $10,256.

Among the major motor hotels opened in 1962 were the 20-story Sheraton Motor Inn and the Howard Johnson Motor Lodge, both in New York City, and Imperial Inn in Chicago.

Editor, "Hotel World-Review."

HOUSING

During the year 1962 the impetus provided by the comprehensive Housing Act of 1961 began to be felt in the United States. The provision of additional substantial sums for federally assisted housing and urban renewal meant a generally high level of activity in these areas. A good deal of experimentation went on with new ways of providing and financing moderate- and low-income housing.

The volume of housing built during the year increased moderately as compared with 1961. Expenditures for upkeep and improvement showed a similar rise. Mortgage interest rates and building costs remained fairly stable. Vacancies in rental units continued to increase, and the large number of foreclosures caused some concern.

Governmental Activity.—With the passage of the omnibus Housing Act by Congress in 1961, no new federal legislation of importance was expected in 1962, and none materialized. Congress confined itself largely to enacting amendments to existing housing legislation, none of which was of major significance.

The most significant state legislation was passed in New York. The New York State Housing Finance Agency was authorized to lend up to $1 billion (an increase of nearly 100%) to limited-dividend companies. The state was also authorized to make loans to nonprofit housing bodies covering up to 50% of project costs. This was designed primarily to promote housing for hospital personnel and the aged. State subsidies were made available for low-income families living in limited-dividend housing. The state was empowered to make 10-year, 4% loans to help middle-income families make down payments on cooperative apartments.

For some time a movement had been under way to create a Department of Housing and Urban Affairs in the federal government, thereby giving full cabinet status to the Housing and Home Finance Agency (HHFA). It was felt that cities should be represented in the cabinet just as was agriculture. In January 1962, the president attempted to use his governmental reorganization powers to create such a department. Congress turned down this proposal by a large majority.

Another movement favored the issuance of an executive order by the president barring discrimination in federally assisted housing. Pending the issuance of such an order, the federal housing agencies embarked on a program of using their existing powers gradually to achieve the same objectives. An example of what was being done in this direction was an announcement by the Federal Housing Administration (FHA) that, by agreement with the state, it would refuse to cooperate with anyone violating the Pennsylvania nondiscrimination statute. Another example was the requirement by the Urban Renewal Administration that all transfer deeds for urban redevelopment project land contain an antidiscrimination covenant. On November 20, President Kennedy issued an executive order prohibiting social and religious discrimination in housing built or purchased with federal aid. Enforcement is being sought through voluntary compliance, with court action contemplated only as a last resort.

Concern grew throughout the United States about the failure to cope with the social and delinquency problems existing in run-down and low-income urban neighborhoods. The HHFA and the Department of Health, Education, and Welfare

BURTON BERINSKY FOR ILGWU'S "JUSTICE"

The International Ladies' Garment Workers' Union cooperative housing development in New York City, Penn Station South, was dedicated by President Kennedy on May 19.

agreed to mount a joint attack on these problems in urban redevelopment and public housing areas. This involved a closer working relation between local housing and public-welfare agencies, with joint efforts to stimulate social services in housing and urban renewal projects. Among the programs embarked upon were basic education programs, home economics instruction, and special programs for children, teen-agers and the aging.

In implementing certain provisions of the 1961 Housing Act there was considerable experimentation in ways of providing subsidized housing for low-income families other than through the construction of low-rent projects for the exclusive use of such families. One device was to subsidize tenants who could not afford to pay economically feasible rentals in limited-dividend projects, comprising individual houses. If their income increased, they were given the opportunity to buy the house in which they lived on favorable terms. Another device was the requisition of run-down housing and its renovation by local housing authorities for rental (subsidized if necessary) to low-income families. A Philadelphia court decision prohibited the local authority from acquiring and fixing scattered housing, thereby confining this type of activity to groups of contiguous structures.

Urban renewal proceeded at a high level. Federal government funds devoted to renewal programs totaled about $250 million during the 1962 fiscal year, and were expected to rise to approximately $333 million during the 1963 fiscal year. By the middle of 1962, the cumulative volume of capital grants made since the beginning of the program amounted to nearly $3 billion.

Housing for the elderly took on added significance quantitatively with the increase in federal aid and the high degree of local interest all over the country in the provision of such housing.

Volume of Residential Construction.—The upward trend in residential construction activity in the United States, begun during the latter part of 1961, continued during 1962. Nevertheless, the rate of house building was not as high as in the near-record year 1959, when 1,553,500 units were started. Due to unusually bad weather conditions in many parts of the country, 1962 began with comparatively low seasonally adjusted annual rates of less than 1.3 million units in January and 1.2 million units in February. An increase to more than 1.4 million units occurred in March, and by May a rate of over 1.5 million had been attained. An increase of about 9% above the 1961 level of 1,355,400 units was predicted for 1962. All of the increase was expected to take place in private housing, with public housing declining by about 20% from the 1961 level of 52,000 dwelling units.

The boom in apartment building, evident in 1961, accelerated during 1962. There were 37% more dwelling units in multifamily structures started in 1961 than in 1960. During the first part of 1962 the increase over the comparable period for 1961 was 43%. Whereas in 1959 less than 16% of the total number of dwelling units started were in multifamily structures, the proportion in 1961 was 24%, and in 1962 was approaching 30%. This increase was partly in response to the rapidly increasing numbers in the 20–29 age group (where marriages are most frequent) who demand rental rather than owned housing. It was partly due also to the rapidly increasing numbers of persons over 70 years of age demanding small, trouble-free dwelling accommodations. In addition, many families were moving back from the suburbs into the big cities—a process furthered by the amenities provided through the expansion of urban renewal.

The total amount of money spent on building new nonfarm housing was $17 billion in 1961. The figure for the first seven months of 1962 was $10.3 billion, compared with $9.1 billion for the same period of 1961. It was predicted that by the end of 1962 nearly $19 billion would have been spent for new housing.

Of nearly equal importance to the production of new housing is the amount spent on maintaining and modernizing the existing stock of housing. Every year vast sums are spent on additions and alterations, maintenance and repairs, and replacements. In 1960 these expenditures amounted to 76% of outlays for new housing. Data available for the first nine months of 1961 showed these expenditures to have been $10.7 billion, or about 9% over the comparable period of 1960. Maintenance and repair accounted for 44% of the total. Additions and alterations to buildings and grounds took another 41%, and replacements made up the balance of 15%.

Of the privately owned nonfarm units started in the first half of 1962, about 76% were financed through conventional loans, without any government assistance. Approximately 19% were financed with FHA-insured loans, and about 5% with loans guaranteed by the Veterans Administration. Comparable figures encompassing the whole of 1961 were 74%, 19%, and 7%, respectively.

Over 120,000 mobile homes were built in 1959, and more than 90,000 in 1961. Mobile homes are complete and fully equipped vehicular portable structures built on a chassis and designed to be used without a permanent foundation as year-round dwellings when connected to utilities. Travel trailers, designed more for movement from place to place, were produced at the rate of about 40,000 per year in this period. Together they constituted more than 10% of housing starts. In the first half of 1962, their production was a third higher than in the comparable period of 1961, and combined they were being produced and sold at a higher rate than nonmobile prefabricated housing.

Construction Costs.—The cost of the average single-family dwelling unit climbed steadily during the decade of the 1950's. In 1961 the average for the year was $13,900, and by mid-1962 it had reached an all-time high of $14,500. The E. H. Boeckh residential building cost index continued to inch its way upward. The construction materials price index remained virtually unchanged from June 1961 to June 1962. During the same period, average hourly earnings of building construction workers rose by a few percentage points.

Market Conditions.—Funds available for mortgage lending were in plentiful supply. Early in 1962, banks and savings-and-loan institutions began to increase the rate of interest paid on savings accounts. As a consequence, large amounts of new savings began to flow into lending institutions.

Interest rates on mortgages reached a high average of over 6% on conventional mortgages in 1960. In 1961, stimulated by a reduction in the FHA-insured mortgage rate, they began to fall. During 1962 they remained fairly stable or showed a slight decline. Average rates on conventional mortgages were between 5½ and 6%, with those in the West being somewhat higher and those in the Southeast slightly lower.

With the high rate of apartment house building, vacancies in rental units continued to rise somewhat. In FHA-insured rental apartments, which have average lower vacancy rates than other rental units, vacancies rose from 2.4% of dwellings in 1957 to 5.4% in 1961 and 5.5% by

the second quarter of 1962. The increases occurred in the Northeast and Middle Atlantic states; elsewhere, vacancies declined.

During the decade of the 1950's the number of mortgages foreclosed rose steadily. Since the foreclosure rate merely kept pace with the increase in the residential mortgage debt, this was no cause for alarm. During 1961, however, foreclosures rose sharply to a level of 73,000 for the year, which was over 40% above the 1960 number. The rise continued during the first half of 1962, reaching a total of nearly 43,000, which was almost one fifth higher than the number for the comparable period of 1961. There were some indications that this high rate would not continue. Delinquent mortgages (those on which payments were overdue but which had not been foreclosed), which were 25% higher in February 1962 than in October 1961, decreased by midyear.

A. BENJAMIN HANDLER,
Professor of Planning,
The University of Michigan.

HOUSTON

The nation's seventh most populous city, Houston, Texas, had a population in 1960 of 938,291. It is the center of a metropolitan area composed of Harris County (area, 1,730 square miles; 1960 pop., 1,243,158).

Houston has a mayor-council type of municipal government; Lewis Cutrer, a Democrat, was mayor in 1962. The 1962 city budget: $77,873,566. Total bond debt (Sept. 30, 1962): $264,891,000. City tax rate: $2 per $100 assessed valuation. Public school enrollment (fall of 1962): about 194,000.

Employment in the Houston metropolitan area: 538,000; unemployment, 23,000 (both estimates as of August, 1962). Retail sales in metropolitan Houston for 1962 were expected to total about $1.750 billion. Bank deposits (Sept. 27, 1962): $2,770,037,012. The Port of Houston in 1961 handled 56,474,299 short tons of commercial waterborne cargo, making it the third-ranking United States port in tonnage.

Rapid commercial and industrial growth of the Houston area continued during 1962. Building permits issued during the first eight months of 1962 exceeded $240 million, up 34% from the same period in 1961.

Announced for an area west of downtown Houston was a 17-building, $100 million skyscraper complex to be built by American General Insurance Company. Also announced were plans for the John Mecom Center, which will include the renovated Warwick Hotel, two office buildings of 25 to 30 stories, and a parking garage. Planned for the Texas Medical Center was a 10-story, $6 million building to house the Heart Institute.

The National Aeronautics and Space Administration's Manned Spacecraft Center began operating in leased quarters pending completion of its $123 million facility 22 miles southeast of downtown Houston. The nation's first seven astronauts were moved to the Houston area, and offices were opened by a number of firms engaged in aerospace and related activities.

During 1962, three direct flights from Houston to Europe were inaugurated. Construction was under way on the initial phase of the new $125–$150 million Jetero Intercontinental Airport.

The Ford Foundation announced the offer of a gift of $2 million to the Alley Theatre. Houston Endowment Incorporated will underwrite the construction of a $6 million center for the performing arts.

Rice University marked its 50th anniversary with the inauguration on October 10 of Dr. Kenneth Sanborn Pitzer as its third president. The inaugural ceremonies were followed by a two-day academic festival attended by leading educators, scholars, and scientists. Dr. Philip G. Hoffman was inaugurated as president of the University of Houston on April 27.

Houston, the nation's largest city without a zoning ordinance, again defeated a zoning proposal in a referendum on November 6.

Major league baseball came to the Southwest for the first time in 1962 as the Houston Colt .45's opened their season on April 10. The Colts, who finished eighth in the National League standings, used a temporary ball park, but an all-weather, domed stadium is due to be completed by 1965, contingent on passage of a $9.6 million bond issue.

Associate Professor of Commerce,
Rice University.

HUMAN RIGHTS. See Index entry.

HUNGARY

A Communist-ruled people's democracy in central Europe, Hungary has an area of 35,912 square miles and a 1960 census population of 9,977,870 (Dec. 31, 1961 est.: 10,055,000). About 97% of the population is Hungarian. The capital and principal city is Budapest (1960 est. pop., 1,807,000). Other important cities (with 1960 estimates): Miskolc (144,000); Debrecen (29,000); Pécs (115,000); and Szeged (99,000).

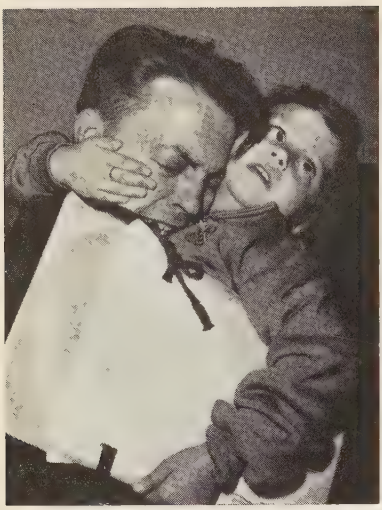
Government.—According to the constitution of 1949, the highest organ of the state is the unicameral 338-member National Assembly, which elects a 21-member Presidium. Both bodies and the cabinet are controlled by the Hungarian Socialist Workers Party (HSWP), which is a Communist party and claimed 478,000 members in 1961. The president of Hungary is István Dobi, and the premier is János Kádár (since Sept. 13, 1961), who is also first secretary of the HSWP's Central Committee. The members of the central government and the local governments (the people's councils) are drawn exclusively from a Communist-controlled organization called the People's Patriotic Front.

Education.—Schooling is compulsory for children aged 6 to 16. The educational system was reorganized in 1959 to combine students' training with part-time work in industry and agriculture. Number of schools (with enrollments), 1959–60: 2,780 preschool (179,488); 6,322 primary (1,314,432); 253 secondary (103,441); 158 technical (41,269); and 22 higher (20,369). Teacher-training and special schools enrolled 6,232 and 15,777 students, respectively. Enrollment of secondary school students totaled an estimated 200,000 in September 1962. The 1962 economic plan provided for the construction of 700 primary and secondary school classrooms, and a 25% increase in expenditures for public education. The Hungarian Academy of Sciences is the highest scientific institution and is organized on the model of the Soviet Academy of Sciences. The four oldest and most prominent universities are located in Budapest, Pécs, Szeged, and Debrecen; the three leading technical universities are at Budapest, Miskolc, and Veszprém.

Religion.—Roman Catholics comprise about 67% of the population; Protestants, 27.3%; Greek Catholics, 2.7%; and Jews, 1.5%. Religious affairs are supervised by the State Office for Church Affairs. The state exerts its influence on the clergy by fostering movements such as the Catholic Opus Pacis, which cooperates with the government. The Communist regime's campaign against the noncooperative segment of the clergy was continued in 1962.

Finance.—Government revenue, 1962 est.: 84.4 billion forints (76 billion in 1961); expenditure, 83.8 billion (76 billion). Total investment in the development of the country was officially estimated at 34.8 billion forints in 1962 (30.7 billion in 1961). The official exchange rate of the forint is 11.74 to the U.S. dollar.

Transportation and Communications.—Transport networks, 1960: railways, 5,552; roads, 17,927; navigable waterways, 871 (chiefly the Danube and Tisza rivers). MAHART, the state shipping company, transported about 2 million tons of freight in 1960 (200,000 more tons than in 1959). MALEV, the state airline, carried 151,900 passengers in 1960. Other data for 1960: motor vehicles, 51,200; telephones, 243,406; radio receiver licenses, 2,224,000; television subscribers, 104,000. Capital investment in transportation, 1962 est.: 3.6 billion forints.



Hungarian freedom fighter Lajos Kovacs greets Kiara, his six-year-old daughter, September 4 in New York City. The parents had not seen their child since 1956, during the unsuccessful attempt to overthrow the Hungarian government.

WIDE WORLD

Agriculture.—Approximately 43% of the population is rural and 62% of the total land area is arable. The new five-year plan (1961–65) calls for complete collectivization and a 32% increase in overall production, with agricultural investment totaling about 38 billion forints and including 20 billion for the development of collective farms. By 1962, 96% of arable land was under state or collective control. Agricultural production in 1961 failed to achieve the planned increase of 7.9% over 1960, and was valued at 62.5 billion forints (62.9 billion in 1960). For the second successive year a drought reduced farm production in 1961, limiting agricultural exports and resulting in lower farm incomes than had been expected. The 1962 economic plan provided for a production increase of 9% to 10% above the 1961 level, and capital investment of 6 billion forints in agriculture (17% of total capital investment). Bread-grain acreage was expected to increase by 7.5%, and wheat acreage by 10.5%. Retail food prices rose by an average 32% in 1961–62.

Hungary's primary crops and 1960 yields (in thousands of metric tons, with 1959 data in parentheses) were: wheat, 1,768 (1,909); rye, 354 (443); maize, 3,504 (3,558); barley, 986 (1,093); oats, 204 (256); potatoes, 2,656 (2,366); and rice, 45 (59). Number of livestock, 1960 (in thousands, with 1959 data in parentheses): cattle, 1,971 (2,004); pigs, 5,356 (6,225); sheep, 2,381 (2,155); and horses, 628 (717).

Industry.—Industrial production in 1961 exceeded planned goals by 3.5%. Labor productivity also rose by 8%, but Hungary's industrial productivity rate is the lowest among Soviet-bloc nations; the productivity index (1950 = 100) was estimated at 141 in 1962. Industrial investment in 1961 totaled 15.2 billion forints (44% of total investment). Two thirds of the predicted production increase of 8% in 1962 was to result from higher labor productivity. The 1962 economic plan called for the completion by 1963 of 168 to 180 major projects, including the Friendship Oil Pipeline from the Soviet Union, the Ajka thermal power station, and the Csepel pipe factory. In July 1962 the State Statistical Office announced that although industrial production goals had been fulfilled, the rate of output was only 8% in the first half of 1962, compared with 10% in the corresponding period of 1961.

Chief industrial products (in million tons, 1961): steel, 2.1 (up 8.9% from 1960); coal, 28.2 (up 6.2%); crude oil, 1.5 (up 18.8%); cement, 1.6 (up 1.9%); aluminum, 0.051 (up 3.1%); bauxite, 1.4 (up 14.3%); and electric power, 8.4 billion kw.-hr. (up 9.9%).

Foreign Trade.—Total exports, 1961: 12,080 million forints (up 18% from 1960); imports, 12,028 million forints (up 5%). The favorable trade balance of 52 million forints contrasted markedly with trade deficits of 274 million forints in 1959 and of 1.1 billion forints in 1960. Chief exports: bauxite and alumina, measuring instruments, textiles, chemicals, corn, and poultry; chief imports: raw materials, machinery and equipment, and foodstuffs. Hungary's principal trading partner is the Soviet Union, which in 1961 took 29.3% of Hungarian exports and supplied 31.0% of total imports. In 1960, about 10% of Hungary's exports went to the members of the Common Market, and 13.5% of the country's imports came from those countries. In the first half of 1962 the volume of trade between Hungary and Western countries rose by 10%.

Events, 1962.—The two most significant internal developments were the accelerated de-Stalinization campaign and the government's efforts to win greater popular support. One aspect of Hungarian de-Stalinization has been the periodic purges in party and governmental circles. In early January it was announced that István Friss, a prominent economist in the HSWP, was relieved of his position as head of the party's Department of State Economy. An intimate friend of deposed Premier Matyas Rakosi, Friss strongly opposed economic liberalization after the 1956 revolt. Imre Dogei, a member of the Central Committee and former minister of agriculture, and Ivan Altomare, former minister of food, were ejected from the party in April on charges of "sectarian and pseudo-leftist views and activities" and of bribery and corruption, respectively.

The major purge was announced on August 19 when the Central Committee reported the expulsion from the HSWP of 25 Stalinists, including Matyas Rakosi and Ernö Gerö, both of whom were formerly party chiefs. They were charged with primary responsibility for the "miscarriages of justice based on forged evidence" which occurred during the years of the "personality cult." Karoly Kiss, a former foreign minister and deputy premier who was generally regarded as the leading Stalinist in the government, was removed from the Politburo. It was alleged that Kiss, who lost his post as party secretary in 1961, refused to accept responsibility for the erroneous decisions and practices of the Central Committee prior to 1956. On Oct. 14, 1962, Vice President György Marosan was ousted from all party and governmental positions because of "fractionalism" and "violation of party discipline."

In an effort to improve the relations of the regime with the public and to utilize numerous unused talents in the service of the state, Premier János Kádár instituted a policy based on the slogan that "whoever is not against us is with us." Kádár declared that all economic administrative positions in industry, agriculture, and government were to be filled on an "efficiency first" basis regardless of party affiliation. It was hoped that the employment of qualified nonparty economists and technicians would prevent the infiltration of the party by so-called careerists. Despite determined opposition among segments of the party, several political leaders and important newspapers argued with firmness that "political reliability" and "professional competence" were not necessarily synonymous, and that public interest should never be sacrificed to the personal whims of a party official. On introduction of the new policy, 20 old-line party officials in key administrative and managerial posts were replaced by young technicians. It was reported later that the new policy had achieved a certain degree of success.

At the 8th Congress of the HSWP, held in Budapest in late November, Premier Kádár declared that his government's de-Stalinization and liberalization policies would continue. He sharply attacked Albanian Communist leaders for opposing Soviet ideology, and indirectly criticized Communist China for supporting Albania. The Hungarian leader endorsed the new Soviet policy of maintaining friendly relations with Yugoslavia, and he said that Hungary was attempting to "normalize poor relations" with the United States. Kádár had conferred earlier in the month with Premier Khrushchev in Moscow, where he reportedly was briefed on the latest Soviet policies regarding the Cuban crisis, other world problems, and economic difficulties within the Soviet bloc.

During the year, Hungary signed trade agreements with West Germany, Japan, and Great Britain, and concluded commercial pacts with Greece, Cyprus, and Cuba. Two groups of Hungarian specialists were dispatched to Guinea to work in bauxite mining and on irrigation projects. Hungary ratified exchange agreements with Great Britain and India, and established diplomatic relations with North Vietnam and Brazil.

Efforts were made in 1962 to mold the country's economy for greater integration within the Soviet bloc's Council for Mutual Economic Assistance. Hungary apparently plans to specialize in producing telecommunications equipment, instrument manufactures, and aluminum; other Soviet-bloc countries are to supply some of the electric power needed for the latter industry. Hungary also intends to rely more on imports of farm machinery from other Soviet-bloc countries. A plan was initiated to decentralize industry by moving to the provinces some factories from Budapest, which account for 52% of the nation's industrial production.

Hungary's growing apprehension over the rapid development of the European Economic Community (Common Market) and its effects on East-West trading relations was apparent in 1962. The press and radio launched a bitter attack against the Common Market because of the latter's alleged anti-Communist nature, its support by the United States, and consideration for membership of such neutrals as Austria, Switzerland, and Sweden.

WAYNE S. VUCINICH,
Professor of History, Stanford University.

HUNTING AND FISHING

The U.S. Department of the Interior reported that a total of 19,394,177 sport fishermen in 50 states spent a record-breaking $52,851,224 (an increase of $708,388 over 1960) for licenses, tags, permits, and stamps, as required by state fish and game departments, to fish during 1961. California, Minnesota, and Wisconsin, in that order, had the most paid fishing license holders, each going over the million mark.

Hunting license figures released by the department also showed an increase over 1960. Data were not available from four states, but a total of 11,798,890 hunters in 46 states paid $64,062,782 for hunting licenses, stamps, tags, and permits in 1961, as compared with the 1960 totals of 11,785,753 and $60,981,203, respectively.

While the number of licensed sportsmen is large, the department points out that it does not reflect accurately the number of persons who hunt and fish, because many are exempt from license requirements because of age, veterans status, or other reasons. Previous surveys of fishing and hunting by the Bureau of Sport Fisheries and Wildlife indicate there are more than 25 million sport fishermen and approximately 15 million hunters in the United States.

U.S. Fish and Wildlife Service.—Continuing its national marine game fish research program, the Fish and Wildlife Service released in 1962 *The 1960 Salt Water Angling Survey.* Planned to estimate anglers' catches, the survey found that 6,198,000 salt-water anglers caught 633,872,000 fish totaling 1,410,952,000 pounds in United States waters (excluding Hawaii) in 1960. The survey marks an important step in determining man's effect on the salt-water fish resources of the nation.

About 34,000 acres of waterfowl habitat was purchased by the federal government in the fiscal year ending June 30, 1961, using up available funds for the program as of that date. The final objective remains at about 3 million acres by 1970.

Differences between National Park Service and state game departments were intensified over the control of fish and wildlife in areas newly acquired by the Park Service. State officials insist on jurisdiction of such areas, as opposed to the complete ban on public hunting in the older national parks imposed by the Park Service. Secretary of the Interior Stewart Udall promised a thorough study of the situation by a distinguished group of citizens. Leading sportsmen were encouraged by the federal appointment of Sigurd Olson as consultant to the secretary of the interior and the National Park Service.

Shooting Foundation.—The newly formed National Shooting Sports Foundation is now fully incorporated and held its first member meeting in Chicago in January 1962 to present a three-way, $150,000 program of shooting activity development in 1962 and beyond. The foundation's purpose is broadly educational: "To foster in the American public a better understanding and a more active appreciation of all shooting sports."

Fishing Records.—The International Game Fish Association announced that 12 new rod and reel all-tackle salt-water records were recognized in the 12-month period ending November 1962. A 69-lb. 1-oz. *albacore* caught in October 1961 by Walter C. Timm at Hudson Canyon, N.J., tied the previous record. The other 11 records are: *California black sea bass* (557 lbs. 3 oz.), caught by Richard M. Lane at Catalina Island, Calif., July 1, 1962; *giant sea bass* (680 lbs.), Lynn Joyner, at Fernandina Beach, Fla., May 20, 1961; *bonefish* (19 lbs.), Brian W. Batchelor at Zululand, South Africa, May 26, 1962; *blue marlin* (810 lbs.), Gary Stukes, at Hatteras, N.C., June 11, 1962; *rainbow runner* (23 lbs.), Lila M. Neuenfelt, at Oahu, Hawaii, May 9, 1961; *Atlantic sailfish* (141 lbs. 1 oz.), Tony Burnand, at Ivory Coast, Africa, Jan. 26, 1961; *porbeagle shark* (390 lbs. 8 oz.), Joseph Monty, at Fire Island, N.Y., May 20, 1962; *allison or yellowfin tuna* (269 lbs. 8 oz.), Henry Nishikawa, at Kauai, Hawaii, May 30, 1962; *wahoo* (149 lbs.), John Pirovano, at Cat Cay, Bahamas, June 15, 1962; *yellowtail* (111 lbs.), A. F. Plim, at Bay of Islands, New Zealand, June 11, 1961; *weakfish* (19 lbs. 8 oz.), Dennis B. Hall, at Trinidad, West Indies, April 13, 1962.

Field & Stream magazine recognized a new world record *sauger* caught with rod and reel. The fish weighed 8 lbs. 5 oz. and was caught on Oct. 22, 1961, by Mrs. Betty Tepner at Niobrara, Nebr. *Field & Stream* also recognized a "caught-by-any-method" world record 4-lb. 4-oz. *redear sunfish,* taken with a cane pole outfit on May 5, 1962, by Jeff Lashley at Gordon, Ala.

ICELAND

An island republic near the Arctic Circle in the North Atlantic, Iceland has an estimated area of 39,770 square miles, and a population of 179,000 (est. July 1, 1961). About one fourth of the area is habitable, and only one fifth is productive. Some 80% of the population lives in towns of more than 300 residents, mainly along the coasts. Reykjavík (1960 pop., 72,407) is the capital.

Government.—The Parliament (or Althing) consists of 60 members elected for four years by a system of direct and proportional representation. The Althing selects a third of its members to form an upper house. Party seating in the Althing (following elections in October 1959): Independence (Conservative), 24; Social Democratic, 9; Progressive (Agrarian), 17; and Labor Union (Communist), 10. Premier Olafur Thors (Independence Party) heads an Independence-Social Democratic coalition cabinet formed in 1959. Asgeir Asgeirsson was re-elected by the Althing to a third four-year term as president of the republic in 1960.

Iceland is a member of the North Atlantic Treaty Organization (NATO), and a NATO base on the island is maintained by the United States under an Iceland–United States agreement of 1951. United States forces in Iceland aggregated about 4,000 men in 1962.

Education and Religion.—Education is compulsory for children aged 7 to 15, and illiteracy is negligible. School enrollment, 1959: primary, 21,865 (1958); secondary, 8,952; technical, 2,822; teacher-training, 156; and higher (the University of Reykjavík), 751. The Evangelical Lutheran Church is the national church, but there is complete religious freedom.

Finance.—Government revenue, 1960: 1,586.6 million krónur (1,166.8 million in 1959); expenditure, 1,539.0 million (1,182.7 million). The króna was devalued in 1960 and 1961 from a par value of 16.3 to the U.S. dollar to a new rate of 43 krónur to the dollar. National debt: 389.1 million krónur at the end of 1959. Gold and foreign exchange holdings: $28.3 million at the end of 1961 ($17.9 million a year earlier).

Transportation and Communications.—The island is without railways. Gravel-surfaced roads aggregate about 6,000 miles. Merchant marine (gross registered tons, 1960): 57,432; fishing fleet, 70,650. Keflavík Airport, near Reykjavík, is used by two Icelandic airlines and by major international airlines. Other data for 1960: motor vehicles, 21,956; telephones, 39,547; licensed radio sets, 50,000.

Production.—National income, 1960: 5.37 billion krónur (up 10% from 1959). Iceland's important fish catch was estimated at 631,000 metric tons in 1961 (514,000 metric tons in 1960); output of fish oil totaled 53,460 short tons (up 43%). Agriculture engages about 20% of the population, and is based on sheep raising (813,000 head in 1960) and dairying (48,500 cattle). Iceland is nearly self-sufficient in meat, dairy products, and eggs, but must import other foods. Chief crops are hay for fodder (329,000 metric tons in 1960), potatoes, and turnips. Manufactures include fish products, clothing, furniture, and other consumer goods. Electric power, 1961: 588 million kw.-hr. (up 9% from 1960); cement, 75,500 metric tons (up 3%). Consumer price index (1953 = 100): 139 in 1961 (132 in 1960).

Foreign Trade.—Total exports, 1961: 2,879.1 million krónur (up 9% from 1960); imports, 3,009.1 million (down 1%). Principal exports are fish products, which account for more than 90% of total export value. Chief imports are mainly fuels, foodstuffs, wood, machinery, textiles, and iron and steel products. Chief customers (with percentage of total Icelandic exports received, 1961): Great Britain (23%); the United States (13%); West Germany (10%). Principal suppliers: the United States (16%); the Soviet Union (14%); and Great Britain and West Germany (11% each).

Events, 1962.—The ruling Independence and Social Democratic parties registered substantial gains in elections to local councils on May 27. The Communist Party suffered losses, apparently as a result of the government's successful economic stabilization program which checked the severe inflationary spiral of recent years, and because of the settlement in 1961 of the Icelandic-British dispute over fishing rights in Iceland's territorial waters, a quarrel that had aroused much anti-Western feeling in the country. Communist propaganda directed against the NATO base on the island and against the United States evidently had little effect on the voters, who displayed growing pro-Western sentiments during the year. The Communist Party on November 28 dropped all 13 Stalinists from its 40-member Central Committee, reportedly because of its loss of popular support.

Iceland on May 22 deported a Czech diplomat for attempting to engage a local pilot in an espionage plot against the NATO base at Keflavík Airport. The spying incident was the first of its kind in Icelandic history.

W. R. F.

IDAHO

A Northwestern state of the United States, Idaho ranks 13th among the states in area (land, 82,708 square miles; inland water, 849) and 42d in population (698,000 on July 1, 1962, a 4.6% increase from the 1960 census figure of 667,191). Urban places with populations above 10,000 in 1960:

Alameda	10,660	Moscow	11,183
Boise City (*capital*)	34,481	Nampa	18,897
Caldwell	12,230	Pocatello	28,534
Coeur d'Alene	14,291	Twin Falls	20,126
Idaho Falls	33,161	Whitney (uninc.)	13,603
Lewiston	12,691		

Government.—Chief executive and judicial officers in 1962 included Robert E. Smylie (Republican), governor, serving a four-year term; William E. Drevlow, lieutenant governor; Arnold Williams, secretary of state; Rulon A. Swensen, treasurer; Joe R. Williams, auditor; Frank L. Benson, attorney general; D. F. Engelking, superintendent of schools; and E. B. Smith, chief justice of the 5-member Supreme Court.

The Idaho Legislature, which convenes in odd-numbered years, comprised 23 Republicans and 21 Democrats in the Senate in 1962 and 30 Republicans and 29 Democrats in the House of Representatives.

Finance.—In the 1961 fiscal year, revenue of $156,615,613 included $56,751,199 from state taxes and $52,137,809 in federal funds. Chief tax yields were from individual income ($20,273,549), motor fuels ($11,910,743), and licensing ($36,943,374). Spending of $125,388,049 included $24,775,669 for education, $6,420,646 for health, welfare, and safety, and $35,571,850 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 3,422 teachers enrolled 125,754

pupils; secondary schools with 3,471 teachers enrolled 46,291; parochial schools with 209 teachers enrolled 6,924. College enrollment totaled 12,412 in 3 junior colleges and 6 colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $60.1 million, including current expenditures of $49 million ($309 per pupil) and capital outlays of $9.5 million. Revenue of $63.02 million was drawn chiefly from state funds ($18.02 million) and local districts ($35 million). The state reported teachers' salaries as averaging $4,593.66 (high school, $4,963.17; elementary, $4,357.02). Actual spending for higher education (1961 fiscal year) totaled $11,883,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 18,184 persons totaled $13,029,137. This amount included $5,260,932 for the aged and $4,478,758 for dependent children.

Transportation and Communications.—With 315 miles of highway construction and reconstruction completed in the 1961–62 fiscal year, *highways and roads* as of Dec. 31, 1962, totaled 40,200 miles (9,411 surfaced). These served 403,553 *motor vehicles* (as registered Dec. 31, 1961), including 261,765 automobiles. Operating in the state in 1961 were 9 *railroads* (using 2,893 line miles of track); 4 regularly scheduled airlines; and 84 commercial and municipal *airports*.

Communications media included (1962) 1 FM and 41 AM *radio stations;* 6 VHF *television stations;* (1961) 13 daily *newspapers* (circulation, 149,000) and 72 other newspapers (98,200); and (Jan. 1, 1962) 63,700 business and 172,100 residential *telephones*.

Labor Force.—The state's labor force in July 1962 included 62,000 agricultural workers. Nonagricultural employment totaled 198,700, compared with 195,800 a year earlier and an average of 188,700 for the calendar year 1961. Of nonfarm employees, 24.4% were in trade, 22.3% in government services, and 19% in manufacturing. Unemployment in July 1962 stood at 13,700, compared with 15,200 a year earlier.

Manufacturing.—Manufacturing engaged 28,894 workers in 1960, including 23,123 in production, and provided a payroll of $139,064,000. Adjusted value added by manufacture totaled $265,997,000.

Leading Idaho manufactures in 1960 were: food and kindred products (9,507 workers; $37,107,000 in wages; $91,110,000 in adjusted value added by manufacture); lumber and wood products (10,650; $51,962,000; $67,196,000); and chemicals and products (2,664; $18,153,000; $56,252,000).

Mining.—Idaho ranked 35th among the states in the value of mineral output in 1961, with 0.38% of the national total. The value of $68,900,000 was about 20% greater than in 1960. Silver output (valued at $16,249,000) was the largest in 23 years, and accounted for 23% of the state total. Combined production of lead ($14,724,000) and zinc ($13,408,000) was the highest in 7 years. Idaho produced all of the nation's antimony, and was first in silver and second in abrasive garnet, lead, and zinc.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $262,594,000, compared with $273,327,000 for the corresponding period of 1961. For the full year 1961, income comprised $196,626,000 from livestock, $228,109,000 from crops, and $14,091,000 in government payments. Principal income sources in 1961 were cattle, $99,605,000; potatoes, $64,554,000; wheat, $58,523,000; and wholesale milk, $53,300,000.

IDAHO CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Alfalfa (1,000 tons)	2,528	2,685	2,685
Apples (1,000 bu.)	1,326	1,150	1,200
Barley (1,000 bu.)	16,767	19,142	26,568
Beans, dry (1,000 bags)	2,344	2,352	2,300
Cherries (tons)	3,272	3,100	3,500
Hay (1,000 tons)	2,907	3,022	3,071
Hops (1,000 lb.)	4,213	5,472	6,596
Onions (1,000 cwt.)	924	770	924
Peas, dry field (1,000 bags)	1,241	1,071	1,821
Potatoes (1,000 cwt.)	34,427	57,734	47,883
Prunes (tons)	20,300	20,500	17,500
Sugar beets (1,000 short tons)	1,559	2,272	2,453
Wheat (1,000 bu.)	42,035	36,250	36,692

(Source: U.S. Department of Agriculture.)

The state's 34,000 farms in 1959 had an acreage of 15,232,000 (3,832,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,359,000 cattle and 1,113,000 sheep.

Events, 1962.—Gambling was, by all odds, the big item of interest in Idaho in 1962. Vernon K. Smith, a Boise lawyer and sometime Republican, advocating local option gambling as a means of financing state services, won the Democratic gubernatorial nomination from a field of six candidates by capturing 43% of the vote. Republican Gov. Robert E. Smylie, after first considering a race against incumbent U.S. Sen. Frank Church, announced for an unprecedented third term. Smith's strong showing in the primary induced the governor to "run scared" in a campaign in which gambling submerged all other issues. In the November 6 election, Smylie defeated Smith by 23,702 votes—a margin five times that of 1958 when the governor defeated another pro-gambling opponent.

Election day ballot-splitting was again the rule. Republicans won three statewide offices: governor, attorney general, and mine inspector; Democrats won the rest. The Republicans again captured the Legislature, holding their former 23–21 margin in the Senate and winning four newly created seats for a 34–29 margin in the House of Representatives. Senator Church defeated Republican John T. Hawley (141,657 to 117,129) to win reelection and lead both tickets in votes polled. In a race for the U.S. Senate seat (four-year term) made vacant by the death on July 23 of Henry C. Dworshak, Republican Len B. Jordan, a former governor, defeated Congresswoman Gracie Pfost by 4,881 votes. The Democrats retained the two congressional seats: Compton I. White won the 1st District seat formerly held by Mrs. Pfost, and Ralph R. Harding was reelected in the 2d District.

Three proposed constitutional amendments were approved. These permit naturalized Orientals to vote and hold office in Idaho; reduce residence requirements for presidential elections from six months to 60 days; and authorize the Legislature to revamp the state courts below the District Court level.

A noteworthy byproduct of this election year was the retirement, by defeat in the primary, of Attorney General Frank L. Benson, whose four-year vendetta against the governor and other state agencies was thereby terminated.

The economic outlook in 1962 was brightened by slow but definite improvement in the lumber industry, a good year in agriculture, an increase in silver prices, and continued growth in phosphate mining and the food-processing industry. Water resources and transportation development continued, characterized by steady progress on the lower Snake River dams, the authorization of construction at the Bruce's Eddy dam site, and the final paving and dedication of Lewis and Clark Highway. Notable too was the progress of the Nez Percé and the Bannock-Shoshoni Indian groups in developing their natural resources.

At the governmental level, continued budgetary problems—especially in education, health, and welfare—and redistricting promise major political battles. State institutions have already requested $119 million for the coming biennium; and a state Supreme Court decision in 1962 blocked redistricting proposals.

ILLINOIS

A North Central state of the United States, Illinois ranks 24th among the states in area (land, 55,930 sq. mi.; inland water, 470) and 4th in population (10,146,000 on July 1, 1962, an 0.6% increase from the 1960 census figure of 10,081,158). Urban places with populations of 25,000 and over in 1960:

Alton	43,047	Granite City	40,073
Arlington Heights	27,878	Harvey	29,071
Aurora	63,715	Highland Park	25,532
Belleville	37,264	Joliet	66,780
Berwyn	54,224	Kankakee	27,666
Bloomington	36,271	Maywood	27,330
Calumet City	25,000	Moline	42,705
Champaign	49,583	Oak Lawn	27,471
Chicago	3,550,404	Oak Park	61,093
Chicago Heights	34,331	Park Forest	29,993
Cicero	69,130	Park Ridge	32,659
Danville	41,856	Pekin	28,146

Government.—Chief executive and judicial officers in 1962 included Otto Kerner (Democrat), governor, serving a four-year term; Samuel H. Shapiro, lieutenant governor; Charles F. Carpentier, secretary of state; Francis S. Lorenz, treasurer; Michael J. Howlett, auditor; William G. Clark, attorney general; George T. Wilkins, superintendent of public instruction; and Roy J. Solfisburg, Jr., chief justice of the 7-member Supreme Court.

The Illinois General Assembly, which convenes in odd-numbered years, comprised 31 Republicans and 27 Democrats in the Senate in 1962 and 89 Republicans and 88 Democrats in the House of Representatives.

Legislation, 1962.—The Illinois General Assembly held a brief "lame duck" special session following the November elections. The only major accomplishment was to establish Illinois as the first state to approve the proposed anti-poll tax amendment to the U.S. Constitution. The amendment would become the 24th if ratified.

The main item on the special session call provided for allocation of additional moneys for the much debated public assistance programs. Governor Kerner had requested an appropriation of $131 million for this purpose and authorization for the transfer of the additional sum from earmarked funds (primarily the motor fuel tax funds) to the general purpose fund. The legislature reduced the amount appropriated to about $28 million, and authorized no transfers. It was obvious that there would be additional emergency moneys needed early in 1963 to continue the public assistance programs.

(See also below, *Events, 1962.*)

Finance.—In the 1962 fiscal year, revenue of $1,536,350,000 included $863,332,000 from state taxes and $305,678,000 in federal funds. Chief tax yields were the 3½% general sales and use tax ($463,926,000), motor fuel taxes ($164,022,000), and licensing ($130,237,000). Spending of $1,302,011,000 included $352,895,000 for education, $449,131,000 for health, welfare, and safety, and $374,148,000 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 53,110 teachers enrolled 1,442,093 pupils; secondary schools with 23,277 teachers enrolled 439,798; and parochial schools with 14,043 teachers enrolled 494,304. College and university enrollment totaled 216,577.

Estimated public school spending in the 1961–62 school year totaled $1,028 million, including current expenditures of $802,564,000 ($502 per pupil) and capital outlays of $177,337,000. Revenue of $1,041,904,000 was drawn chiefly from state funds ($207,118,000) and local districts ($677,302,000). Teachers' salaries averaged $6,156 (high school, $6,585; elementary, $5,951). Actual spending for higher education (fiscal 1961) totaled $149,910,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 443,806 persons totaled $286,013,933. This amount included $125,837,674 for dependent children and $66,543,087 for the aged.

Transportation and Communications.—A total of 1,022 miles of highway construction and reconstruction were completed in 1961; *highways and roads* on Dec. 31, 1960, totaled 102,189 miles (93,528 surfaced). These served 4,072,797 *motor vehicles* (as registered on Aug. 31, 1962), including 3,397,782 automobiles. Operating in the state in 1962 were 63 *railroads* (using 10,709 line miles of track); 20 regularly scheduled *airlines;* 127 commercial and municipal *airports;* and 64 heliports.

Communications media included (1961) 98 AM and 42 FM *radio stations;* 17 *television stations;* (1961) 82 daily *newspapers* (circulation, 3,841,321); and (Jan. 1, 1962) 1,406,400 business and 3,519,400 residential *telephones.*

Labor Force.—The state's labor force on June 15, 1962, included 249,000 agricultural workers. Nonagricultural employment totaled 3,587,900, compared with 3,518,300 a year earlier and an average of 3,482,800 for 1961. Of nonfarm employees, 33.5% were in manufacturing, 20.9% in trade, and 14.1% in service industries. Unemployment on June 15, 1962, had dropped to 203,000 from the 265,000 reported a year earlier.

Manufacturing.—Manufacturing engaged 1,208,781 workers in 1960, including 850,058 in production, and provided a payroll of $6,834,461,000. Adjusted value added by manufacture totaled $12,652,587,000.

LEADING ILLINOIS MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1] (in thousands)
Food and kindred products	126,193	$ 688,619	$1,794,759

Mining.—Illinois ranked 8th among the states in 1961 in the value of its mineral output, with 3.15% of the national total. Production was about 2% less than the 1960 record. The state was first in output of fluorspar and tripoli; third in stone; and fourth in coal.

ILLINOIS MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Cement:		
Portland (376 lb. bbl.)	8,595,000	$ 28,301,000
Masonry (280 lb. bbl.)	461,000	1,420,000
Clays	1,982,000	4,166,000
Coal	45,246,000	177,070,000
Coke	1,841,273	35,416,000[1]
Fluorspar	116,908	5,956,000
Iron, pig	4,774,495	288,469,000[1]
Lead (recoverable content of ores)	3,430	707,000
Natural gas (1,000 cu. ft.)	9,970,000	1,276,000
Natural-gas liquids (1,000 gal.)	357,240	17,806,000
Petroleum, crude (1,000 bbl.)	79,387[2]	237,367,000[2]
Sand and gravel	31,353,000	35,098,000
Stone	36,361,000	47,939,000
Zinc (recoverable content of ores)	26,795	6,163,000
Other minerals	...	11,805,000
Total	...	$571,605,000[1 3]

[1] Values for processed materials are not included in the total. [2] Preliminary. [3] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $1,588,600,000, compared with $1,482,105,000 for the corresponding period of 1961. For the full year 1961 income comprised $1,176,328,000 from livestock, $984,104,000 from crops, and $106,059,000 in government payments. Principal income sources in 1961 were cattle, $475,118,000; hogs, $460,931,000; corn, $416,947,000; and soybeans, $358,053,000.

The state's 155,000 farms in 1959 had an acreage of 30,327,000 (20,968,000 in harvested crop-

ILLINOIS CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	2,315	2,500	2,200
Corn for grain (1,000 bu.)	538,109	638,476	686,410
Hay (1,000 tons)	4,786	4,267	4,376
Oats (1,000 bu.)	124,575	91,504	80,560
Peaches (1,000 bu.)	873	870	650
Popcorn (1,000 lb.)	46,881	70,200	62,400
Soybeans (1,000 bu.)	110,543	157,320	158,888
Tomatoes (1,000 cwt.)	110	97	103
Wheat (1,000 bu.)	47,460	60,192	49,465

(Source: U.S. Department of Agriculture.)

land). Livestock on farms on Jan. 1, 1962, included 3,862,000 cattle, 7,664,000 hogs, 11,442,000 chickens, and (1961) 17,558,000 commercial broilers.

Events, 1962.—The Republicans won the statewide races in the November elections, with U.S. Senate Minority Leader Everett M. Dirksen heading the ticket. Dirksen defeated Rep. Sidney R. Yates by a 213,195 majority. President Kennedy appeared in Springfield and Chicago for Yates—appearances that proved to be his last before the Cuban crisis. Former President Eisenhower made two separate appearances for Dirksen. Both Dirksen and Yates were nominated over token opposition in the April primaries.

Two Democratic incumbents lost their bids for reelection when William Scott defeated State Treasurer Francis S. Lorenz and Ray Page defeated State Superintendent of Public Instruction George T. Wilkins. In the other statewide races, Republicans were elected to the three board of trustees' seats at the University of Illinois and to the clerkship of the state Supreme Court.

The partisan division of the Illinois delegation to the U.S. House of Representatives was changed from 14 Democrats and 11 Republicans to 12 seats for each party (Illinois having lost one seat through congressional reapportionment). In the featured contest of incumbents, Republican Paul Findley defeated Democrat Peter F. Mack, Jr. Long-time Representatives Robert B. Chiperfield, Noah M. Mason, and Marguerite S. Church did not seek reelection.

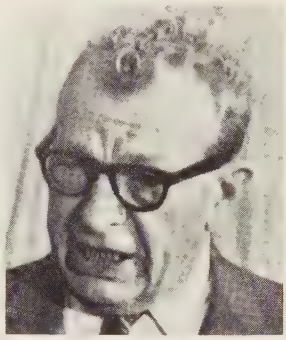
More trouble loomed ahead for Democratic Governor Kerner when the Republicans retained majorities in both houses of the 1963 General Assembly. The division in the Senate became 35 to 23, and in the House, 90 to 87. With the narrow division in the House there was talk of the Democrats again, as in 1961, organizing that body with Republican defectors. This would be important since the 1963 legislature will face serious fiscal problems, as well as a mandate to reapportion the House districts.

A major surprise in the November elections was the passage of a new judicial article to the state's constitution, culminating a long drive by the state bar organization. The amendment, which passed despite strong downstate opposition, provided both for a reorganization of the structure of the judiciary and for a new system of selecting judges. A similar amendment was narrowly defeated in 1958.

A running battle developed between the governor and the Public Aid Commission. The nonsalaried commission, headed by Chicago merchant Virgil Martin, administers the expensive public assistance programs, including the controversial Aid to Dependent Children Program (ADC). The governor was critical of the administration of these programs, and at one point advocated an across-the-board reduction in recipient payments. Chairman Martin, a Kerner appointee, resigned and was replaced by Chicago industrialist Arnold Maremont, who had held other positions in the Kerner administration. At the end of the year, a new debate centered on whether the commission should disseminate birth control information to ADC recipients.

Racial disturbances broke out at the southern end of the state. The previous year there had been trouble in Chicago. In 1962 the problem area was Cairo, where an integration movement by students continued through most of the summer. After an outbreak of violence during a demonstration, the integrationists went to Springfield in August to protest that 53 of their members had been arrested, compared with only 4 of their antagonists. Kerner promised an investigation.

In a case which gained national prominence, a condemned killer was spared on August 1 when Governor Kerner commuted his death sentence to life imprisonment. The convict, Paul Crump, 32, had received 14 stays of execution during a 9-year legal battle. His claim that he had been completely rehabilitated was supported by prison officials, clergymen, and others who enlisted in the campaign to save him.



Republican Everett Dirksen of Illinois won his third Senate term in 1962, but by a lower margin than previously.

ILLITERACY. See Index entry.

IMMIGRATION AND NATURALIZATION

During the year ended June 30, 1962, a record 173 million persons entered the United States, including repeated entries across the Canadian and Mexican borders. Of these repeated entries, 70 million were made by citizens and 95 million by aliens. Another 2½ million of the entrants were crewmen, and the remainder consisted mainly of passengers arriving at United States ports aboard 68,828 vessels and 179,648 airplanes.

Immigration.—Aliens admitted for permanent residence during the fiscal year 1962 numbered 283,763, an increase of 5% over the previous year. This increase was caused mainly by a further 17% increase in the number of Western Hemisphere immigrants, which was partially offset by a 7% decline in the number of immigrants coming from Europe. By far the largest number of immigrants arrived from Mexico, where 55,291, or more than 19%, of all the immigrants were born. A total of 119,692 were born in Europe, including 24,088 in Germany, 21,189 in the United Kingdom, and 21,442 in Italy. Of the 22,105 immigrants born in Asia, 3,897 were from Japan, 3,437 from the Philippines, and 4,017 from China.

Special legislation permitted the admission of 24,098 aliens during fiscal 1962 as nonquota immigrants. Of these aliens, 1,809 were admitted under the Act of Sept. 11, 1957, including 1,316

orphans, 289 beneficiaries of preference quota visas, and 204 refugee-escapees. There were in addition 17,400 aliens admitted under the Acts of Sept. 22, 1959, and Sept. 26, 1961, which provided that certain close relatives of citizens and alien residents of the United States should be admitted as nonquota immigrants.

Quota immigrants during the fiscal year 1962 numbered 90,319, 6% less than the previous year's figure, reflecting a decrease in the number of quota immigrants from the United Kingdom, Germany, Poland, and Ireland. (See Table 1.)

Table 1—IMMIGRANT ALIENS ADMITTED TO THE U.S. IN THE YEAR ENDED JUNE 30, 1962

Country or region of birth	Total admitted	Quota immigrants	Nonquota immigrants

Other countries	409	286	123

(Source: U.S. Immigration and Naturalization Service.)

The quota system, based on national origin, provides preference categories for aliens with specialized experience or exceptional ability, and for specified close relatives of citizens and resident aliens. Under this provision, 3,313 highly skilled aliens, accompanied by 3,721 spouses and children, were admitted in 1962 in the first preference category. This group included 361 engineers, 347 professors and teachers, 146 physicians, 246 nurses, 69 chemists, and 72 other scientific personnel.

In the other preference categories, 11,729 relatives of citizens and resident aliens were admitted during the fiscal year 1962, a decrease of 21% from the previous year.

A total of 193,444 nonquota immigrants were admitted, 10% more than in the previous fiscal year. This figure included 30,316 spouses and children of United States citizens, 133,505 natives of the Western Hemisphere (chiefly Canada and Mexico) with their spouses and children, and the 24,098 other nonquota immigrants admitted under special legislation.

The Act of July 14, 1960, authorized the attorney general to parole into the United States alien refugee-escapees who may be granted permanent resident status two years after their entry. This law, scheduled to expire on June 30, 1962, was extended indefinitely by the Migration and Refugee Assistance Act of June 28, 1962. During the fiscal year 1962, 5,132 such refugees were found qualified for parole.

Anti-Castro Cubans continued to seek refuge in the United States in large numbers. At the end of the fiscal years 1962 there were approximately 125,000 Cubans in the United States in temporary status. (See also REFUGEES AND DISPLACED PERSONS.)

Nonimmigrants.—During the fiscal year 1962, 1,331,383 nonimmigrant aliens were admitted for temporary periods, exclusive of Mexican agricultural laborers, border crossers, and alien crewmen, a 9% increase over the previous year. Tourists, or visitors for pleasure, numbered 810,779, 68,000 more than in the previous year. One fourth of the visitors came from Europe, most of them from the United Kingdom, Germany, France, Italy, the Netherlands, and Switzerland. In addition, 117,242 persons visited the United States for business reasons. The admission of 41,202 students and 26,977 exchange aliens exceeded the 1961 total by 17% and 11%, respectively. Other nonimmigrants included 45,891 official representatives of foreign countries, 110,276 alien travelers who passed in transit through the United States, and 37,067 temporary workers and industrial trainees. In addition, 1,762,356 alien crewmen were granted shore leave, and 282,556 Mexican agricultural workers were admitted.

Apprehension and Expulsion of Aliens.—During the fiscal year 1962, 92,758 deportable aliens were located and apprehended, 4% more than in the previous year. Many of these aliens were lawfully admitted to the United States and became deportable after entry, while 16,570 entered illegally. A total of 7,637 aliens were deported from the United States, and 54,164 aliens were required to depart without formal deportation proceedings.

Naturalizations.—A total of 127,307 aliens were admitted to United States citizenship during the fiscal year 1962, 4% less than in the previous year. Of this number, 98,739 persons were naturalized under the general provisions of the law. Under special provisions, more than 17,000 persons gained citizenship as the spouses of citizens, and almost 9,000 as children of citizens. More than half of the children naturalized came from the same four countries as in 1961—Germany, Greece, Italy, and Korea—where most of the orphan adoptions by United States citizens took place.

Table 2 shows the principal countries of former allegiance of persons naturalized during the years ended June 30, 1958 to 1962.

The number of certificates of derivative citizenship issued increased by 2% to 31,589 during the fiscal year 1962. Of this total, 14,057 were issued to persons born abroad who acquired citizenship at birth through their citizen parents. The remaining 17,532 certificates were issued to persons who were aliens at birth and derived

INCOME

National economic activity in the United States was higher in 1962 than in the previous year. As shown in Table 1, gross national product[1] for the first three quarters of 1962 was at a record annual rate (seasonally adjusted) of $551 billion, 6% above the calendar-year 1961 total of $519 billion. (The annual rate data represent the average of estimates for the first three quarters which have been adjusted for seasonal influences and multiplied by four to facilitate comparisons with previous annual totals.) The bulk of the rise in gross national product (GNP) from 1961 to the first three quarters of 1962 represented a further expansion in the volume of production; only a minor part of the rise in GNP was accounted for by higher prices.

Table 1—GROSS NATIONAL PRODUCT OR EXPENDITURE, 1959–62
(Billions of dollars)[1]

Item	1959	1960	1961	1962[2]

[2] Data cover first three quarters and represent averages of seasonally adjusted quarterly totals expressed at annual rates. (Source: U.S. Department of Commerce, except 1962.)

[1] *Gross national product or expenditure* measures the market value of the output of goods and services produced by the nation's economy, before deduction of depreciation charges and other allowances for durable capital goods used up in the productive process. Other business products used by business in the accounting period are excluded.

National income[2] in the first three quarters of 1962 amounted to an annual rate of $455 billion, compared with $428 billion in 1961 (see Table 2). Personal income[3] in the 1962 period was at an annual rate of $438 billion, and disposable income—personal income less personal taxes—amounted to $380 billion (see Table 3). Each of these comprehensive measures of the flow of income to individuals was at an annual rate in the first nine months of 1962 approximately 5% above the total for calendar year 1961.

Table 3—PERSONAL INCOME AND DISPOSITION OF INCOME, 1959–62
(Billions of dollars)[1]

[2] Data cover first three quarters and represent averages of seasonally adjusted quarterly totals expressed at annual rates. (Source: U.S. Department of Commerce.)

Changes in National Output.—Gross national product advanced to an appreciably higher level in early 1960 but did not show much change during the summer. Declines occurred during the last two quarters of 1960 and the first quarter of 1961. The movement of economic activity was then reversed, and GNP rose from a low of $501 billion (annual rate) in the first quarter of 1961 to $539 billion in the final quarter. The pace of advance moderated in 1962, but further increases carried GNP to an annual rate of $555 billion in the third quarter. In the special budget review issued in November 1962 by the Bureau of the Budget, it was assumed for purposes of federal revenue estimation that gross national product would continue to rise in the final quarter of 1962 and would amount to $554 billion for the year as a whole. This was about $13 billion below the projection for 1962 which had been made by the administration early in the year.

Measured in physical volume, gross national product in the third quarter of 1962 was 6½% above the prerecession high in the second quarter of 1960; it was 9% above the recession trough in the first quarter of 1961 and 2% higher than in the fourth quarter of 1961. The Federal Reserve Board index of industrial production (covering manufacturing, mining, and utilities) increased 13% from its January–February 1961 trough to the following December, and then showed a further

[2] *National income* is the sum of the net earnings of labor and property which arise from the current production of goods and services by the nation's economy. It measures, therefore, the total factor cost of the goods and services produced by the economy. Earnings are measured in the forms in which they accrue to residents of the nation, before deduction of taxes on those earnings.

[3] *Personal income* is the current income received by persons from all sources, including transfers from government and business but excluding transfers among persons. It differs from national income by the inclusion of transfers (such as relief, veterans' pensions, and unemployment compensation) which are not in return for current productive services, and by the exclusion of earnings (social insurance contributions and undistributed corporate income) which are not actually received by persons in the current period.

advance of 3½% from December 1961 to October 1962.

Whether measured in the aggregate or for the industrial sector alone, production in the United States in the summer and autumn of 1962 was at a record level, substantially higher than at the low point of the recession in early 1961. However, the magnitude of the production gain was attributable primarily to the sharpness of the economy's advance during 1961. The further advance which occurred in the first nine or ten months of 1962 was relatively modest, and tended to level out. It was not sufficient to permit marked progress toward reasonably full utilization of resources. In October, seasonally adjusted unemployment represented 5½% of the labor force—about the same as in the early months of the year—and there was considerable excess capacity in most lines of industry. (See also INDUSTRIAL PRODUCTION; LABOR.)

Table 4—PERSONAL INCOME BY STATES AND REGIONS, 1960 AND 1961[1]

State and region	Total personal income (in millions of dollars) 1960	1961	Per capita income (in dollars) 1961	Percent of national per capita income 1961

[1] The estimates of "state personal income" shown in this table differ in definition in one respect from the personal income data in Table 3. This pertains to the exclusion from the state estimates of income disbursed by the federal government to its civilian and military personnel stationed outside the continental United States. (Source: U. S. Department of Commerce.)

Patterns of Demand.—The upward course of national output in 1961 and 1962 stemmed in large part from an advance in personal consumption expenditures, supported by a rising flow of personal income. Purchases of goods and services by federal, state, and local governments increased considerably (see Table 1). In the investment area, the value of residential construction in the first three quarters of 1962 was at an annual rate 9% higher than in 1961. Over the same period, there were increases of 3½% in nonresidential construction and 12% in producers' purchases of durable equipment. Most of the rise in the level of durable equipment purchases took place by the end of the calendar year 1961.

The principal explanation of why the gross national product for 1962 fell substantially short of the administration's projection was to be found in the behavior of business investment in construction and equipment. Whereas such investment had been expected to rise markedly throughout the year and to exceed its 1961 dollar value by about 15%, it was evident that the actual increase would be little more than half that large. (See also BUSINESS DATA, U.S.)

National Income.—Among the major industrial divisions of the economy, the main impact of the business recession and ensuing recovery in the 1960–62 period was on manufacturing, especially the durable goods industries. Income originating in most other broad industrial groups increased moderately in both 1961 and 1962.

As may be seen from Table 2, the principal fluctuations from 1959 to 1962 in the distributive shares of national income were registered by corporate profits. On a before-tax basis, this typically volatile income flow advanced rapidly from a recession low of $40 billion (annual rate) in the first quarter of 1961 to about $51.5 billion in the fourth quarter of 1961, and then dipped slightly in the first two quarters of 1962. For the year as a whole, corporate profits before tax were estimated by the Bureau of the Budget, in the November 1962 budget review, at $50.7 billion, compared with $45.6 billion in 1961. (See also BUSINESS DATA, U.S.)

Personal Income by States.—The dollar flow of income to individuals was at a record high in nearly all states in 1961, the latest year for which official estimates were available in 1962. For the country as a whole, personal income in 1961 was 4% larger than in 1960. Relative increases were fairly uniform among the regions (see Table 4). Income expansion differed markedly from the nationwide rate only in the Great Lakes states, where the decline of durable goods production during the 1960–61 recession had a particularly heavy impact.

Per capita personal income (total income divided by total population) rose 2% from 1960 to 1961, reaching $2,263. Differences among the states and regions in average-income levels are recorded in the table.

Assistant Director, Western Hemisphere Department, International Monetary Fund.

INCOME TAX. See TAXATION.

INDIA

Set off from the rest of Asia by the Himalaya, the world's highest mountain system, India extends for about 2,000 miles from the Tibetan border to Cape Comorin on the Indian Ocean. It has an area of 1,264,012 square miles, coastlines aggregating 3,535 miles, and a land frontier of 9,425 miles. The seventh largest country in the world, India is second only to Communist China in population. Final results of the 1961 census (announced by the census commissioner on Sept. 10, 1962) included the North-East Frontier Agency, Nagaland, and, for the first time, the former French and Portuguese territories.[1] An all-

[1] Transfer of the former French settlements of Pondicherry, Karikal, Yanaon, and Mahé was formally completed on Aug. 16, 1962. The Portuguese enclaves of Dadra

India population of 439,235,082 (males, 226,293,620; females, 212,941,462) was recorded exclusive of the Pakistan-held area of Jammu and Kashmir (see KASHMIR).

Politically, India is a union of former native states; it became a sovereign democratic republic on Jan. 26, 1950, while remaining a member of the Commonwealth of Nations. With the partition of Bombay in 1960 to form Maharashtra and Gujarat and the incorporation of the Portuguese enclaves in 1961–62, India consisted of 15 states, 9 centrally administered territories, and the protected state of Sikkim. A 16th state, Nagaland, is in process of formation (see below, *Government*).

Components of the Indian Union, with provisional 1961 census totals, are shown in the accompanying table.

REPUBLIC OF INDIA

Component	Area (sq.mi.)[1]	Population (1961)[2]	Capital
States			
Andhra Pradesh	106,052	35,977,999	Hyderabad
Assam[3]	84,899[4]	11,860,059[5]	Shillong
Bihar	67,189	46,457,042	Patna
Gujarat	72,138	20,621,283	Ahmadabad[6]
Jammu and Kashmir[7]	86,024	3,583,585	Srinagar
Kerala	15,003	16,875,199	Trivandrum
Madhya Pradesh	171,210	32,394,375	Bhopal
Madras	50,132	33,650,917	Madras
Maharashtra	118,530	39,504,294	Bombay
Mysore	74,122	23,547,081	Bangalore
Orissa	60,162	17,565,645	Bhubaneswar
Punjab	47,084	20,298,151	Chandigarh
Rajasthan	132,150	20,146,173	Jaipur
Uttar Pradesh	113,452	73,752,914	Lucknow
West Bengal	33,928	34,967,634	Calcutta
Territories			
Andaman and Nicobar Islands	3,215	63,438	Port Blair
Dadra and Nagar Haveli	160	57,932[8]	
Delhi	573	2,644,058[9]	Delhi
Goa, Daman, and Diu	1,505	625,831[10]	Goa
Himachal Pradesh	10,879	1,348,982	Simla
Laccadive, Minicoy, and Amindivi Islands	11	24,108	
Manipur	8,628	778,318	Imphal
Pondicherry[11]	186	369,083	Pondicherry
Tripura	4,036	1,141,492	Agartala
Protected State			
Sikkim	2,744	161,080	Gangtok
Total	1,264,012	438,416,673	

[1] Revised in January 1961 pending final surveys of boundaries by the Survey of India. [2] Provisional. [3] Including North-East Frontier Agency. [4] Including Part B tribal areas (32,289 square miles) and Naga Hills-Tuensang area (6,236 square miles). [5] Excluding North-East Frontier Agency and Nagaland. [6] Temporary. [7] Status in dispute with Pakistan; area for entire state, population for Indian-held area. [8] 1962. [9] Aggregate of Old and New Delhi. [10] 1960. [11] Including Pondicherry, Karikal, Yanaon, and Mahé.

The census disclosed that the urban population (61,870,000 in 1951) had risen to 77,840,000 in the intercensal period. Six cities had populations exceeding 1,000,000: Calcutta, 2,926,498 (including the metropolitan area, 5,550,195); Bombay, 4,146,491; Delhi (old and new cities), 2,644,058; Madras, 1,725,216; Hyderabad, 1,252,337; and Ahmadabad, 1,149,852, while 103 cities (exclusive of those in Kerala) had populations exceeding 100,000. Taking into account Pakastani infiltration into Assam, West Bengal, and Tripura, the Central Statistical Organization has projected the population at 492,000,000 in 1966, 555,000,000 in 1971, and 625,000,000 in 1976, for an increase of more than 42% in 15 years. Family planning clinics increased from 1,649 in 1961 to almost 4,000 in 1962, of which 3,000 were in villages.

Government.—The Union Parliament consists of a Council of States (Rajya Sabha) and a House of the People (Lok Sabha), numbering 236 and 507 members, respectively, in 1962, while each state has an appointed governor and its own popularly elected legislature. Dr. Sarvepalli Radhakrishnan, vice president of India since 1952, was elected president for a 5-year term by a 3,920-member electoral college on May 11, 1962, succeeding Dr. Rajendra Prasad, who had held that office since 1950. Meanwhile, on May 7, Dr. Zakir Hussain, governor of Bihar, was elected vice president for a 5-year term by the same body.

In 1962 the Indian electorate numbered 216,047,643, of whom 53.7% voted in elections held on February 16–25 (during April in Himachal Pradesh and in snowbound constituencies of the Punjab), returning 494 directly elected members to the House of the People. Recording 51,247,168 votes (45.06%) in 489 contests, the Congress Party won

and Nagar Aveli (renamed Nagar Haveli), as of Aug. 11, 1961, and those of Goa, Damão (renamed Daman), and Diu, by vote of Parliament on March 20, 1962, have become Indian Union territories.

UPI; AUTHENTICATED NEWS INTERNATIONAL; LONDON DAILY EXPRESS

356 seats, adding 5 more in the delayed elections for a total of 361 (10 less than at the 1957 elections), and also secured an absolute majority in 10 state assemblies. The Communist Party, with 11,377,765 votes (a gain of 623,690), did not increase its representation of 29 seats. On April 9, Jawaharlal Nehru, leader of the Congress Party, formed a new administration (sworn in on April 10), consisting of a 17-member cabinet, which he heads as prime minister, and 6 ministers of state.

Legislation was enacted by Parliament on August 29 (approved September 3), providing for the formation of Nagaland as a separate state. Consisting of three districts (Kohima, Mokochung, and Tuensang), the new state was to have 1 representative in each house of Parliament. Meanwhile, the campaign led by Angami Zapu Phizo for Naga independence continued with an effort to present a case before the United Nations.

Defense.—Urged by Prime Minister Nehru to repel the encroachments of Chinese Communist forces, the principal elements of India's small regular army were deployed on the northern border in 1962. Outposts in Ladakh were doubled, while in the eastern sector a new Frontier Corps under Lt. Gen. B. M. Kaul was charged with the defense of the northeastern border and was ordered also to protect Sikkim and Bhutan. Increasing numbers of Indian and Chinese troops were engaged in heavy sporadic fighting, which on October 20 developed into a full-scale Chinese attack (see below, *The Year 1962 in India*).

Education and Religion.—Recognized institutions (1959): preprimary schools, 1,164; primary, 229,220;

AMERICANA MAP BY DONALD T. PITCHER

INDIA—BORDER DISPUTE WITH CHINA

Fighting between India and Communist China (October 20 to November 21) was in the North East Frontier Agency in the east and the Ladakh District in the west (arrows on map).

secondary, 53,302; vocational and technical, 3,410; special education, 51,300. Other facilities (1959): professional, arts and science, and other colleges, 1,553; universities (1960), 43. Students, all categories (1960 est.): 43,500,000.

Principal religious groups (percentages, 1961 census): Hindus, 84.99; Muslims, 9.93; Christians, 2.30; Sikhs, 1.74; others, 1.04.

Finance.—Revised estimates showed revenue of Rs.10,791.1 million (1 rupee equals U.S.$0.21) in 1961–62, expenditures of Rs.10,451.5 million, receipts on the capital account of Rs.8,507 million, and capital disbursements of Rs.9,145.2 million. Revenue in 1962–63 was estimated at Rs.13,208.7 million and expenditure at Rs.13,816.5 million, the resulting deficit to be met by new taxes and by excise duties yielding an estimated Rs.717 million. Capital account estimates for 1962–63 forecast receipts of Rs.15,060.4 million and disbursements of Rs.14,490 million. In March 1962, the public debt totaled Rs.74,020 million.

The total outlay for the Third Five-Year Plan (1961–66) is estimated at $24,360 million, including $5,460 million in foreign aid. Revised commitments by an international consortium total $2,365 million for the first two years of the plan, the United States contribution (by far the largest) being $545 million for 1961–62. For 1962–63 the United States again matched the contributions of seven European countries, Canada, and Japan, aggregating $435 million. With $200 million promised by the World Bank and the International Development Association, commitments by the consortium totaled $1,070 million, as compared with $1,305 million for 1961–62.

India's gold and foreign exchange holdings declined from $665 million on Dec. 31, 1961, to $505 million on Aug. 31, 1962.

Transportation and Communications.—Aircraft of the Civil Aviation Department, using 85 airports, flew 30,900,000 miles on international and domestic flights in 1960, carrying about 921,000 passengers and 168,500,000 pounds of mail and freight. Passengers on state railways, 1959–60: 1,534,030,000; freight carried, 145,479,000 tons. National highway mileage, 1961: 14,881; other surfaced roads, 144,000; unsurfaced roads, 274,000. Motor vehicles, March 31, 1960: 579,024 (private cars, 231,048). Telephones, 1961: 470,559; radio licenses, 2,341,643.

Economic Indicators.—National income: Rs.142.0 billion in 1960–61 (Rs.129.4 billion in 1959–60). Index of agricultural production in 1960–61 (1952–53 = 100): 139.1; general index of industrial production (1958 = 100) in 1961, 129 (122 in 1960). Cost-of-living index (1949 = 100): 129 in July 1962 (126 in July 1961). Per capita income (1950–51 = 100), based on the 1961 census at current prices: Rs.327.8 (Rs.302 in 1959–60).

Manufactures and Minerals.—Chief industrial products (metric tons, 1961): crude steel, 4,104,000 (up 816,000 from 1960); finished steel, 2,811,600 (up 772,800); jute manufactures, 970,800 (down 114,000); cement, 8,244,000 (up 408,000); sugar, 2,841,000 (up 250,800); and wheat flour, 1,090,800 (up 172,800). Textile products (meters, 1961): cotton cloth, 4,701,600,000 (up 81,600,000); woolen cloth, 13,224,000 (down 756,000). Chief mineral products (metric tons, 1961): coal, 56,064,000 (up 3,468,000); iron ore, 12,132,000 (up 1,536,000); copper ore, 423,264 (down 24,600); crude petroleum, 523,200 (up 78,000); magnesite ore, 209,748 (up 53,424); and gold (kilograms), 4,872 (down 120). Electricity generated (1961): 19,104 million kw.-hr. (up 2,676 million from 1960). Motor vehicles (1961): 54,312 (up 2,652 from 1960); sewing machines, 317,112 (up 21,324).

Agriculture.—Agriculture accounted for 48.1% of national income in 1960–61. Net area sown, 1960–61: 327,000,000 acres. Production of food grains (crop year ended June 30, 1962): 80.5 million tons (about the same as in 1960–61). Yields of other principal crops (in thousands of metric tons), calendar year 1961: pulses, 12,689 (up 1,049 from 1960); oilseeds, 9,034 (up 789); tobacco, 299 (up 13); tea, 326 (up 10); and peanuts, 5,100 (up 676). Other agricultural produce, 1961: cotton, 5,400,000 bales (392 pounds each); jute, 5,000,000 bales (400 pounds each); and milk, 22,000,000 metric tons (21,000,000 in 1960).

Foreign Trade.—In the fiscal year 1961–62 export income rose to Rs.6,651.8 million (Rs.6,422.9 million in 1960–61); imports totaled Rs.10,015 million (Rs.11,069 million in 1960–61), the adverse balance of trade (Rs.4,646.1 million in 1960–61) declining to Rs.3,363.2 million. Exports (1961–62) included (in millions) fabrics, Rs.2,285; food, Rs.2,150.6; and beverages, Rs.1,182.4; imports included machinery and transport equipment, Rs.3,517.2; manufactured goods, Rs.2,095.5; raw materials, Rs.1,340.9; and food, Rs.1,191.4.

DONOVAN ROWSE,
Author and Publicist.

THE YEAR 1962 IN INDIA

On Oct. 20, 1962, Communist Chinese forces attacked Indian territory in strength south of the McMahon Line frontier between Assam and Tibet; on October 22, Prime Minister Jawaharlal Nehru confessed that India had been living in "an artificial atmosphere of our own creation"; and on October 29, the Indian government requested military assistance from the United States. These events completely overshadowed all other developments of the year.

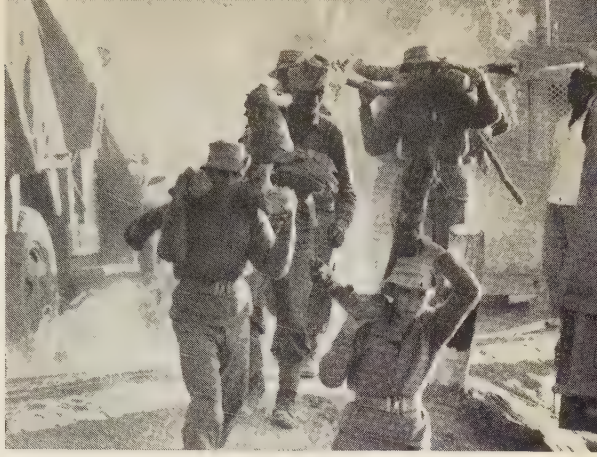
The outbreak of an undeclared war on the Sino-Indian border was the culmination of a dis-

pute between the two countries dating from the Chinese occupation of Tibet in 1950–51. The Chinese refusal to accept the Indian version of the Himalayan border either in Assam or in the Ladakh region of Jammu and Kashmir led to clashes between military patrols in 1959. Negotiations in 1960–61 to reconcile the opposing views proved fruitless, and during the first half of 1962 Chinese and Indian diplomatic notes traded charges of additional border infringements. At the same time, China completed a process of isolating India from her neighbors by agreeing (as announced on May 3) to negotiate a settlement with Pakistan in respect to the portion of the Kashmir-Sinkiang border under Pakistani control.

Armed clashes in midsummer made it apparent that the Chinese were preparing to assert their claims against India by force, and on September 8, Chinese incursions south of the McMahon Line near the junction of Tibet, Bhutan, and Assam began. In the continuing exchange of notes between the two governments during September and October, the Indian government ruled out negotiations —again proposed by Peking—so long as Chinese troops remained on Indian territory. Then, on October 13, New Delhi—amid increasingly frequent border clashes and ominous reports of Chinese troop movements—ordered the Indian Army to "eject" the Chinese. The Chinese response came on October 20 and succeeding days, with the Indian Army forced to withdraw steadily, giving up the base town of Towang, 17 miles south of the McMahon Line, on October 25, and losing all of the disputed territory in Ladakh. On October 26, a state of emergency was declared by President Sarvepalli Radhakrishnan, vesting almost unlimited powers in Nehru and his cabinet. The strategic village of Walong fell on November 18, and Bomdi La the next day, endangering Tezpur and the Assam plains.

Three days later, on November 21, the Chinese government announced a unilateral cease-fire effective at midnight, and stated that beginning on December 1 its troops would withdraw "20 kilometers behind the line of actual control" as of Nov. 7, 1959. Since the Chinese definition of this line would leave them in control of all the disputed territory in Ladakh, the cease-fire proposals were rejected informally by India on December 1, but the fighting was not then resumed. On December 6, the Indian government announced that it would close its consulates in China on December 15, and that it had demanded that the Chinese consulates in India also be closed. The Chinese government demanded on December 9 that India state clearly whether or not it agreed with the cease-fire proposals, implying that the attacks would be resumed if an acceptable reply was not received. The Chinese terms were rejected by India, as announced by Nehru to Parliament on December 10. In a speech broadcast to the Indian troops later that day, the prime minister warned of the possibility of renewed Chinese aggression.

These developments meanwhile caused a political upheaval within the Congress Party. Indian military reverses evoked a demand for new leadership and especially for the dismissal of Defense Minister V. K. Krishna Menon. Long disliked in Indian political circles, Menon won popular acclaim and notoriety in late 1961 by his direction of India's conquest of Goa and other Portuguese enclaves, and capitalized on this, with Nehru's support, to win election to Parliament in February by a smashing victory over his anti-Communist opponent. The complete failure of his "trust-the-Chinese" defense policy, however, gave his enemies the opportunity to destroy him politically.



WIDE WORLD

Indian troops build a road used for supplying the northeastern front during the fighting with China in November.

Reluctantly yielding to pressure, the prime minister on October 31 changed Menon's title to minister of defense production and assumed the defense portfolio himself, but this device did not satisfy the critics. On November 7, at a meeting of the Congress Parliamentary Party, Nehru was forced to accept Menon's resignation. Soon afterward, on November 14, Y. B. Chavan, the vigorous chief minister of Maharashtra, was appointed defense minister. The demand for further changes was parried by the formation of a 30-man advisory National Defense Council, including some cabinet members, state chief ministers, and military officers. Its creation was further evidence of the prime minister's reluctance to part company with his old comrades, which he had demonstrated earlier in the year by making practically no cabinet changes after the elections.

In the third Indian general elections, held on February 16–25, the Congress Party once again won a massive though slightly reduced majority in the Lok Sabha, the lower house of Parliament. Including 5 seats filled in April, it received 361 of the 494 elective seats and 45.06% of the popular vote. Opposition parties, especially those of the right, however, showed increasing strength, most markedly in the state legislatures. Only in Maharashtra—where the Congress Party had been nearly destroyed in 1957 for opposing the linguistic division of Bombay state (finally conceded in 1960)—did the party under Chavan's leadership improve its position, winning 215 of 264 seats. Elsewhere the party lost ground, and in Madhya Pradesh and Rajasthan was able to retain power only with the support of independents.

Conferring in New Delhi on November 23 are (from left) U.S. Assistant Secretary of State Harriman, Assistant Secretary of Defense Nitze, U.S. Ambassador Galbraith, and Prime Minister Nehru. Harriman headed an aid mission.

WIDE WORLD

In the Hindi-speaking north, Hindu communal parties made impressive gains: in the Lok Sabha, 14 seats were won by the Jan Sangh, 1 by the Hindu Mahasabha, and 2 by the orthodox Ram Rajya Parishad; in Madhya Pradesh and Uttar Pradesh the Jan Sangh formed the official opposition in the legislatures. In the other Hindi states (Bihar and Rajasthan) and in Gujarat (and in Orissa, where state elections were held in 1961), the conservative Swatantra (Freedom) Party became the official opposition, while in the Lok Sabha it won 22 seats and later added another by a byelection victory over the Congress Party. On the left, the Socialists continued to suffer from their factional divisions: the Praja Socialist Party (PSP) vote secured only 12 seats in Parliament, while the independent Socialists won 6 seats. The combined forces of the two Socialist parties held important blocs in Uttar Pradesh, Madhya Pradesh, and Bihar, but only in Mysore did the PSP become the official opposition. (In October, the PSP withdrew from the Kerala coalition ministry, losing its only toehold in power.)

At the extreme left, the Communist Party (CPI) confirmed its standing as the second party in India, with 10% of the vote and 29 seats in the Lok Sabha. In Andhra and West Bengal the CPI formed the opposition, and it continued in that role in Kerala, where state elections had been held in 1960. These gains were jeopardized by later developments. A power struggle within the party between nationalist (right) and pro-Chinese (left) factions had grown in intensity since the beginning of the border dispute in 1959, and the death in January 1962 of A. K. Ghosh, the right-leaning general secretary, forced a direct confrontation between the extremes in the choice of a successor. A compromise solution was reached on April 29, with the election of nationalist S. A. Dange of Maharashtra to the new office of party chairman, while the more left-leaning E. M. S. Namboodiripad of Kerala was chosen general secretary.

The cracks in the party structure thus papered over were split open again under the impact of the Chinese attack. In a search for unity the National Council of the CPI met in Delhi on October 31 in emergency session, and the following day issued a resolution reflecting right-wing views, denouncing Chinese aggression and abuse of Nehru and pledging full support to the war effort. In doing so, the CPI defied a "directive" published by the Peking *Jenmin Jihpao,* informing Indian Communists that "progressive forces" must resist the pressures of bourgeois nationalism and work to preserve "Sino-Indian friendship" from disruption by imperialists. The nationalist stance of the CPI, however, was not enough to allay public anti-Communist emotions, and it came under increased attack. On November 7, more than 50 members of the CPI's "China lobby" were arrested as potentially disloyal, and on November 21 over 200 other Communists were jailed.

Despite India's conflict with a Communist power and her receipt of sympathy and support from the United States and Great Britain, Nehru sought to preserve his position of nonalignment. To balance Western arms shipments, he received confirmation that before the end of the year the USSR would deliver MIG fighters ordered by India (much to Western dismay) during the summer. Subsequently, however, the Soviet government notified India that the planes would not be shipped as scheduled, although a few planes were promised for December delivery. The overall Soviet attitude seemed in doubt because of conflicting Russian commitments to India and Communist China.

Similar conflicts existed between the American decision to send arms to India and standing United States commitments to Pakistan. The Indians promised to use American arms only against the Chinese, but the Pakistani government felt that so long as the Kashmir dispute remained unsettled any strengthening of India was a threat to the security of Pakistan. This was the situation on November 22, when W. Averell Harriman arrived in Delhi at the head of a United States aid mission. Together with Duncan Sandys, British secretary of state for Commonwealth relations, he induced Nehru and President Mohammed Ayub Khan of Pakistan to agree to enter into negotiations on Kashmir, as announced on November 29. Ministerial talks were held in Rawalpindi, Pakistan, on December 27–29.

INDIANA

A North Central state of the United States, Indiana ranks 38th among the states in area (land, 36,185 square miles; inland water, 106) and 12th in population (4,715,000 on July 1, 1962, an increase of 1.1% from the 1960 census figure of 4,662,498). Urban places with populations above 15,000 in 1960:

Anderson	49,061	Kokomo	47,197
Bloomington	31,357	La Porte	21,157
Columbus	20,778	Lafayette	42,330
Connersville	17,698	Logansport	21,106
East Chicago	57,669	Marion	37,854
Elkhart	40,274	Michigan City	36,653
Evansville	141,543	Mishawaka	33,361
Fort Wayne	161,776	Muncie	68,603
Frankfort	15,302	New Albany	37,812
Gary	178,320	New Castle	20,349
Hammond	111,698	Richmond	44,149
Highland	16,284	South Bend	132,445
Hobart	18,680	Terre Haute	72,500
Huntington	16,185	Valparaiso	15,227
Indianapolis (*capital*)	476,258	Vincennes	18,046
Jeffersonville	19,522		

Government.—Chief executive and judicial officers in 1962 included Matthew E. Welsh (Democrat), governor, serving a four-year term; Richard O. Ristine, lieutenant governor; Charles O. Hendricks, secretary of state; Robert E. Hughes, treasurer; Mrs. Dorothy Gardner, auditor; Edwin K. Steers, attorney general; William E. Wilson, superintendent of public instruction; and Norman F. Arterburn, chief justice of the 5-man Supreme Court.

The Indiana General Assembly, which convenes in odd-numbered years, comprised 26 Democrats and 24 Republicans in the Senate in 1962 and 66 Republicans and 34 Democrats in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $553,544,241 included $420,525,787 from state taxes and $117,470,574 in federal funds. Chief tax yields were from gross income ($204,472,761), motor fuels ($105,382,923), and licensing ($52,332,201). Spending of $566,319,540 included $198,568,685 for education, $92,120,531 for health, welfare, and safety, and $208,541,287 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 25,490 teachers enrolled 793,600 pupils; secondary schools with 12,410 teachers enrolled 257,200; and parochial schools with 3,637 teachers enrolled 127,626. Enrollment in colleges and universities totaled 105,294.

Estimated public school spending in the 1961–62 school year totaled $439,650,000, including current expenditures of $362,200,000 ($392 per pupil) and capital outlays of $68,000,000. Revenue of $506 million was drawn chiefly from state funds ($145 million) and local districts ($285 million). Teachers' salaries averaged $5,725 (high school, $6,100; elementary, $5,540). Actual spending for higher education (1961 fiscal year) totaled $131,997,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 71,135 persons totaled $49,590,839. This amount included $20,810,214 for the aged and $15,503,933 for dependent children.

Transportation and Communications.—A total of 533 miles of highway construction and reconstruction were completed in fiscal 1961; rural and municipal *highways and roads* on Dec. 31, 1960, totaled 102,185 miles (79,741 miles of rural roads surfaced). These served 2,417,807

motor vehicles (as registered in the 1962 fiscal year), including 1,764,521 automobiles. Operating in the state in 1961 were 30 *railroads* (using 8,328 line miles of track); (1962) 7 regularly scheduled *airlines;* and 26 commercial and municipal *airports.*

Communications media included (1962) 65 AM and 26 FM *radio stations;* 6 VHF and 11 UHF *television stations;* (1961) 90 daily *newspapers* (circulation, 1,642,200); and (Jan. 1, 1962) 472,200 business and 1,421,600 residential *telephones.*

Labor Force.—The state's labor force in June 1962 included 153,600 agricultural workers. Nonagricultural employment totaled 1,458,500, compared with 1,416,900 a year earlier and an average of 1,575,600 for 1961. Of nonfarm employees, 36.87% were in manufacturing, 17.28% in trade, and 12.58% in government services. Unemployment in June 1962 was down to 89,500 from the 125,100 reported for the previous June.

Manufacturing.—Manufacturing engaged 590,000 workers in 1961, and provided a payroll of $3,007 million. Estimated value added by manufacture totaled $7,061 million.

LEADING INDIANA MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Totals	587,970	$3,303,418	$6,259,833
Primary metals	94,385	597,774	1,135,033
Transportation equipment	85,759	549,222	888,407
Electrical machinery	85,916	455,585	836,975
Food and kindred products	49,497	246,397	603,264
Nonelectrical machinery	51,829	303,454	529,240
Chemicals and products	21,711	140,297	501,673
Fabricated metals	42,625	235,359	420,569

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—Indiana ranked 22d among the states in the value of its 1961 mineral production, with 1.09% of the national total. A decline in mineral output was attributed to lessened demand for construction materials, as well as for mineral fuels, and to the petroleum output decrease of 6%. No metals were produced in the state.

INDIANA MINERAL PRODUCTION, 1961
(In short tons except as noted)

Mineral	Quantity	Value
Clays	1,362,000	$ 2,446,000
Coal	15,106,000	58,815,000
Coke	7,666,870	133,000,000[1]
Iron, pig	8,865,419	522,733,000[1]
Natural gas (1,000 cubic feet)	382,000	77,000
Peat	57,146	502,000
Petroleum (1,000 bbl.)	11,152[2]	33,233,000[2]
Sand and gravel	19,577,000	16,898,000
Stone	18,001,000	33,062,000
Other minerals	...	55,475,000
Total	...	$197,965,000[1,3]

[1] Values for processed materials are not included in the total. [2] Preliminary. [3] Total adjusted to eliminate duplicating the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $826,873,000, compared with $829,176,000 for the corresponding period of 1961. For the full year 1961 income comprised $715,373,000 from livestock, $476,617,000 from crops, and $70,174,000 in government payments. Principal income sources in 1961 were hogs, $305,007,000; cattle, $178,899,000; soybeans, $167,907,000; and corn, $162,083,000.

The state's 128,000 farms in 1959 had an acreage of 18,613,000 (11,147,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 2,103,000 cattle, 5,092,000 hogs, 503,000 sheep, and 13,856,000 chickens, and (1961) 122,747,000 commercial broilers. An average of 187,000 family and 26,000 hired workers engaged in farming during 1961.

INDIANA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	1,525	1,350	1,850
Corn for grain (1,000 bu.)	268,859	308,802	352,436
Oats (1,000 bu.)	47,691	26,620	33,275
Soybeans (1,000 bu.)	49,641	75,068	77,308
Tobacco (1,000 lb.)	12,657	14,440	15,200
Tomatoes (1,000 cwt.)	328	352	330
Wheat (1,000 bu.)	36,326	45,150	38,908

Events, 1962.—Divided political control existed in Indiana throughout 1962. When the year opened the governor (Matthew E. Welsh) was a Democrat, and the lieutenant governor (Richard O. Ristine) a Republican; the Democrats controlled the upper house of the General Assembly, the Republicans the lower house. All other key state administrative officials, except the superintendent of public instruction, were Republicans. Seven congressmen were Republicans, four were Democrats; and each party controlled one of the U.S. Senate seats.

Birch E. Bayh, Jr., of Indiana, won a Senate seat in November by defeating Republican Homer E. Capehart.

WIDE WORLD

The state and congressional elections on November 6 resulted in a major upset with the defeat of Sen. Homer E. Capehart, veteran Republican who had represented Indiana in the U.S. Senate since 1945. Capehart lost to the youthful but politically experienced Democratic nominee, Birch E. Bayh, Jr., by the narrow margin of 904,795 to 895,319. The victory gave Hoosier Democrats both Senate seats and also attracted national attention to Bayh, a Terre Haute attorney and former Indiana House speaker. The Republicans won both houses of the General Assembly, but the postelection death of a Republican senator meant that neither party then had control of the upper house. All incumbent congressmen were reelected. The offices of governor and lieutenant governor were not involved in the voting.

Despite cutbacks in some expenditures, state fiscal affairs remained tight because revenues were less than anticipated. By year's end Democratic and Republican leaders alike were aware that the General Assembly, meeting early in 1963, must raise taxes, cut expenditures, or do both. Less well understood was the fact that Indiana's budget difficulties had resulted in part from several years of sluggishness in overall economic output and in total personal and corporate income, as well as from rising state expenditures. Fortunately, 1962 showed some signs of growth in both output and income. In view of the unfavorable fiscal situation, Republican strength in the 1963 General Assembly loomed as a possible political liability. This was especially true since legislative reapportionment, postponed since 1921, seemed inevitable, and was expected to be hazardous to the party responsible.

Local school reorganization was retarded because of disagreements over the pros and cons of alternative plans, court suits against proposed plans, and hopes that the 1963 legislature might modify basic requirements. The Post-High School Education Study Commission, established by the 1961 legislature, endorsed increased state support for university extension centers but recommended permissive legislation to allow local communities to establish junior colleges. Dr. Herman B. Wells retired as president of Indiana University on June 30, having completed 25 years of service. He was succeeded by Elvis J. Stahr, Jr., who resigned as secretary of the Army to take the post.

In economic matters, bipartisan efforts to obtain federal aid for an Indiana deep-water port on Lake Michigan (at Burns Waterway, near Ogden Dunes) continued amid contradictory reports and signals from the federal government. Plans for a giant steel finishing plant to be constructed just east of the projected port were announced by the Bethlehem Steel Company on December 3. The $250 million facility, to be known as the Burns Harbor plant, will occupy a 3,300-acre site in Porter County. The first section of the plant is due to be completed in 1964, and plans call for the eventual development of a fully integrated iron and steel works at a cost of about $1 billion.

President Kennedy on February 19 signed a bill authorizing up to $1 million in federal funds for Indiana's first national park, the 200-acre Abraham Lincoln Boyhood National Memorial, near Lincoln City.

INDONESIA

The Republic of Indonesia consists of some 2,000 inhabited islands located along the equator between the Pacific and Indian oceans. It has an area of 577,000 square miles, exclusive of West New Guinea. The principal islands (with area in square miles) are Kalimantan or Borneo (208,000, exclusive of the British Borneo territories), Sumatra (164,000), Sulawesi or Celebes (73,000), and Java (51,000). (For the status of West New Guinea, see below, *Events, 1962.*) Population (1961 census): 97,135,348, including 750,000 (mid-1961 est.) for West New Guinea; principal cities, with 1961 populations: Djakarta, the capital, 2,973,052; Surabaja, 1,007,945; Bandung, 972,556; Semarang, 503,153; Medan, 479,098; Palembang, 474,971; Makasar, 384,159; Surakarta, 367,626; Malang, 341,452; Djogjakarta, 312,698. Indonesian, which is based on Malay, is the official language.

Sukarno was born in the city of Surabaja, Java, in 1902. After receiving a degree from the Technical Institute of Bandung, he became active in the nationalist movement in 1926. During the next 15 years he was jailed three times by the Dutch and was exiled to Sumatra in 1940. In World War II, Sukarno collaborated with the Japanese, and when they capitulated in 1945, he took advantage of the interval period before the return of the Dutch to consolidate Indonesian control. When the war against the Dutch was eventually brought to an end in 1947, through United Nations intervention, Sukarno assumed presidency of the newly created Indonesian state. Immensely popular with the people, Sukarno prescribed for the young republic a system of "guided democracy" in which he as president would exercise unrestricted political power. Internationally, he advocated a policy of neutralism and soon became an influential leader of the Afro-Asian bloc.

Government.—Indonesia proclaimed its independence of the Netherlands on Aug. 17, 1945, and received the transfer of sovereignty from the Netherlands on Dec. 27, 1949. The original 1945 constitution, readopted in July 1959, provides for a strong chief executive with a cabinet responsible to him, a unicameral Parliament, and a Supreme Advisory Council to advise the president. President Sukarno has been chief of state since 1945, and also serves as prime minister, chairman of the Supreme Advisory Council, and supreme commander of the armed forces. Parliament consists of 283 members as appointed by the president in 1960. The Supreme Court is the chief judiciary organ.

Education and Religion.—School enrollment, 1958–59: 8,109,661. Number of schools (with enrollments), 1958–59: 34,124 primary (7,380,734); 3,685 junior secondary (579,247); 968 senior secondary (149,680). In January 1961 there were 65,000 students in 83 institutions of higher learning. Principal religions: Muslim (approximately 90% of the population); Protestant (4%); Roman Catholic (1%); Hindu (1%).

Finance.—Government revenue, 1962 est.: 61,010 million rupiah (66,000 million in 1961); expenditure, 97,996 million (82,650 million), exclusive of expenditure for West New Guinea campaign. At the official rate of exchange, 45 rupiah equal U.S.$1. Gold and foreign exchange of the Bank of Indonesia: U.S.$146 million as of Jan. 31, 1962 (down U.S.$191 million from Dec. 31, 1960).

Transportation and Communications.—Transport networks (miles, 1960): state-owned railways, 4,150; roads, 48,190. Merchant marine tonnage (end of 1961): 210,000. National airline: Garuda Indonesian Airways (air routes, 21,700 miles in 1958; presently serving Malaya, Thailand, Hong Kong, Philippines, and Japan; 161,392,000 passenger-miles in 1960). Passenger cars: 103,300 (1960); commercial vehicles, 92,400 (1960). Telephones: 115,000 (1960); radio receiver licenses, 631,000 (1958).

Economic Indicators.—Gross national product: U.S. $8.03 billion (est.) in 1961 (up 2% at constant prices from 1960). Index of agricultural production (1952–53–1956–57 = 100): 112 in 1960–61 (108 in 1959–60). Cost-of-living index (1958 = 100): 209 in 1961 (169 in 1960).

Manufactures and Minerals.—Chief mineral products (metric tons, 1961): petroleum, 21,288,000 (up 3% from 1960); tin, 18,840 (down 18%). Textiles, paper, cement, and matches are principal manufactures.

Agriculture.—Chief crops (thousands of metric tons, 1961): rice (rough), 13,460 (up 2% from 1960); rubber, 681 (up 7%); sugar, 600 (down 11%); cassava, 11,278 (1959); sweet potatoes, 2,719 (1959); maize, 2,092 (1959).

Foreign Trade.—Total exports, 1961: U.S.$784 million (down 7% from 1960); imports, U.S.$794 million (up 38% from 1960). Principal exports (million U.S. dollars, 1961): rubber, 305 (down 19% from 1960); petroleum, 260 (up 18% from 1960); coconut products, 38 (up 12% from 1960); tin 37 (down 31% from 1960). Principal imports: rice, cotton yarn and fabrics, chemicals, iron and steel products, machinery, and vehicles. Chief customers (with percentage of total Indonesian exports received, 1960): Singapore (23%), United States (22.5%), United Kingdom (11%), Malaya (7%), West Germany (6%); principal suppliers: United States (17% of total provided, 1960), followed in order by Japan, Communist China, Burma, and West Germany.

Events, 1962. *West New Guinea.*—At the end of 1961 the United States was reported to be trying to bring Indonesia and the Netherlands together for discussion of the problem of West New Guinea (also called Netherlands New Guinea, or West Irian). Progress toward negotiations was temporarily threatened when, on January 15, Dutch ships sank an Indonesian motor torpedo boat in the waters between Aru Island and the southwest coast of West New Guinea. In spite of the increased tension, however, both sides responded affirmatively to a plea on January 17 by UN Acting Secretary General U Thant to discuss with him the possibilities of a peaceful settlement.

Early in March, both sides announced their readiness to meet for secret preliminary talks to explore the possibilities for formal negotiations. The talks opened on March 20 at Middleburg, Va., in the presence of retired American diplomat Ellsworth Bunker, appearing in a private capacity at the invitation of U Thant. On March 23 the talks were recessed to allow Indonesian representative Adam Malik to consult with President Sukarno in Djakarta. Four days later President Sukarno de-

clared that the Dutch position at the talks was "unsatisfactory" and that the talks were broken off. Sukarno's statement was preceded by an Indonesian landing on the island of Waigeo off the northwest coast of West New Guinea on March 23, and an Indonesian air attack which damaged a Dutch vessel anchored off the small island of Gag, west of Waigeo.

In April, Ambassador Bunker urged that the parties resume negotiations, and proposed for West New Guinea a two-year transition period under United Nations supervision, followed by a transfer of administration to Indonesia, with provision for exercise of Papuan self-determination after the transfer. President Sukarno replied at the end of April that he was willing to resume talks on this basis, but he rejected the two-year transition period as too long. The Dutch accepted Ambassador Bunker's proposals in May as a basis for further negotiations. Meanwhile, Indonesian infiltrations into West New Guinea continued, and in mid-May the first infiltrations by parachute were carried out.

Talks were resumed on July 12 at Middleburg, and on July 19, Foreign Minister Subandrio arrived to take part in the negotiations. On July 31, U Thant announced that the two sides had reached an agreement. The main points of this agreement, formally signed in New York on August 15, provided that: (1) the Netherlands transfer West New Guinea to a United Nations Temporary Executive Authority (UNTEA); (2) after May 1, 1963, UNTEA will transfer administration to Indonesia; and (3) before the end of 1969 the Papuan population will be given the opportunity to decide whether they wish to remain with Indonesia or to become independent. Netherlands authority over West New Guinea was transferred to UNTEA on October 1. (See also NETHERLANDS; WEST NEW GUINEA.)

Foreign Affairs.—The United States role in encouraging the West New Guinea negotiations was a major feature of United States–Indonesian relations in 1962. The year was also marked by Attorney General Robert Kennedy's visit to Indonesia from February 12 to 18. General Maxwell Taylor, chairman-designate of the Joint Chiefs of Staff, visited Indonesia in September, as did Peace Corps director Sargent Shriver. After his visit, Shriver indicated that he understood the Indonesian government would welcome Peace Corps volunteers in Indonesia. In July, Allan Lawrence Pope, an American citizen who had been condemned to death for participation in the 1958 rebellion against the Indonesian government, was released and left Indonesia.

The continuation of the West New Guinea dispute resulted in increased military aid from the USSR. In February the newly appointed Indonesian air force chief of staff, Air Vice Marshal Omar Dani, visited the USSR to discuss the speed-up of Soviet arms deliveries. By mid-April, Soviet military equipment was reported to be arriving at an increasing rate. On May 3 Foreign Minister Subandrio and Deputy Defense Minister Maj. Gen. Hidajat arrived in Moscow for further discussion of West New Guinea and of accelerated arms deliveries. At the end of June, Chief Marshal K. A. Vershinin, commander-in-chief of the Soviet Air Force, returned Omar Dani's visit. Vershinin told reporters that the USSR was ready to provide Indonesia with the necessary aid to make good the latter's claim to West New Guinea.

Domestic Affairs.—President Sukarno reorganized his cabinet on March 6. Most portfolios were given to persons already in the cabinet, with some reassignment of responsibilities. President Sukarno

WIDE WORLD

Indonesian Foreign Minister Subandrio (left), UN Acting Secretary General U Thant (center), and the Dutch ambassador to the United Nations, C. W. A. Schurmann, exchange papers on the West New Guinea agreement on September 20.

continues to serve concurrently as prime minister, Djuanda Kartawidjaja as first minister, and Dr. Subandrio as deputy first minister for foreign affairs.

The Indonesian Communist Party, which claims a membership of over 2 million, held its Seventh Party Congress in Djakarta in April. A high point of the congress was an address by President Sukarno, who expressed his pleasure that he had removed "Communist-phobia" from the minds of the Indonesian people, and told the gathering that there was now general acceptance of the role that Communists should play in Indonesia.

Two unsuccessful attempts were made on the life of President Sukarno during the year. In the first, at Makasar, Celebes, on January 7, the president escaped unhurt as a hand grenade exploded one hundred yards from his car. The second attempt occurred in Djakarta on May 14, at an early morning Muslim prayer meeting. The attacker fired several shots at close range, but his aim was apparently deflected by the president's bodyguard. Police identified the assailant as a member of the Darul Islam, a fanatical Moslem group based in West Java.

In spite of this burst of activity, the Darul Islam appeared to be largely eliminated as an armed dissident threat with the capture on June 4 of S. M. Kartosuwirjo, leader of the group. Since the surrender of other rebel leaders in 1961, Kartosuwirjo had been the only armed dissident leader of consequence still at large. He was tried, and was executed on September 12.

In October the government announced that martial law would be lifted throughout the country in 1963. Martial law was proclaimed on a nationwide basis in March 1957, and remains in effect in many parts of the country.

The Economy.—The year was a difficult one for the Indonesian economy. Officials repeatedly commented on the deficits in foreign trade and payments and in government revenue, rising prices, shortages of rice and of other essentials, and the low level of primary production. The West New Guinea campaign, requiring arms imports, domestic stockpiling, and diversion of transport, was a major factor. Natural disasters aggravated the rice shortages. Deficiencies in the distribution system were frequently cited, and President Sukarno asked for an end to "regional blockades" in the traffic of foodstuffs. The president also charged in April that price rises in essential foods were caused by such acts as the setting of unreasonable prices by money lenders in the rice market. To encourage exports, the government in

March began to permit exporters to retain 15 per cent of foreign exchange earned.

Throughout the year steps were taken to improve production of certain important export items. American experts undertook comprehensive surveys of Indonesia's principal coal and tin producing areas. In April the government announced that an exchange of tin experts was being discussed with the government of Bolivia. The government has also acquired new machinery in order to step up production of tin and bauxite. In July, First Minister Djuanda announced that a rubber replanting program had begun. The program calls for replanting of 27,000 hectares (1 hectare equals 2.471 acres) in 1962, and a total of 270,000 hectares over an eight-year period.

Chaerul Saleh, minister of basic industries and mining, declared in April that in view of the shortage of capital, Indonesia was prepared to cooperate with foreign oil enterprises, provided that the latter were willing to act as contractors to the government for a limited period. In June the Pan-American Oil Company agreed to begin its operations in Indonesia as a contractor for a 30-year period with the state-owned Pertamin Oil Mining Corporation. Saleh stated that the foreign oil companies already in Indonesia must also accept this status.

Redistribution of land to peasants began in September under the terms of the land reform regulations. The first phase calls for redistribution of 225,000 hectares to peasants who have hitherto tilled the land but not owned it. The land reform is scheduled for completion in 1965.

INDUSTRIAL DESIGN. See Index entry.

INDUSTRIAL HEALTH AND SAFETY

The Federal Hazardous Substances Labeling Act, for which regulations were issued in August 1961, emphasized the need for acute toxicity data on industrial chemicals. This was pointed up by a report issued in 1962, listing range-finding toxicity data on more than 300 commercial compounds. Data on oral, skin absorption and inhalation toxicity, and irritation to the skin and eyes were presented. The fact that this information was from a single laboratory was indicative of the broad scope of this type of investigation.

There is intense interest in fluorocarbons, and numerous new compounds are being produced. The toxicity of these substances range from highly toxic chemical warfare agents to those so physiologically inert that they can be used as a food propellant. They are important as refrigerants and insecticides, and some are being considered as anesthetics and diagnostic agents. A review of the toxicity of these numerous materials, with particular reference to chemical constitution, provides much meaningful and useful information for further industrial application of these substances.

Organic phosphorus compounds are important and widely used insecticides. Some are highly toxic and, therefore, information on their metabolism and biochemical action is essential to their safe use in industry. A comprehensive review of the effects of these compounds on the enzyme cholinesterase, mechanism of action, metabolism, symptoms of poisoning, and specific antidotes is timely.

A book titled *Toxicity of Industrial Metals* by Ethel Browning, published in England in 1961, discusses 44 metals with regard to properties, industrial uses, metabolism, toxicology, and in some cases industrial poisoning and treatment. The book is an excellent critical review of the literature, with numerous references to original articles.

The 1962 list of threshold limit values contains 295 compounds. Hygienic Guides containing pertinent information on hazard, evaluation, and control were published for benzene, bromochloromethane, carbon tetrachloride, methyl chloroform, epichlorohydrin, ethylene chlorohydrin, methyl chloride, nitromethane, nitroethane, propyl alcohol, and cumene. American Standard Maximal Acceptable Concentration was approved for benzene, toluene, xylene, p-dichlorobenzene, methylene chloride, and nitrogen dioxide.

Toxicity Research.—Concurrently with routine studies, considerable attention was directed to the changing objectives in industrial health. Early efforts were concerned with specific industrial diseases. The goal now is to attain a high level of health and well-being. In the field of toxicology, new concepts and procedures are being utilized to evaluate the mechanism of toxic stress and to find early indications of toxic effects before injury occurs. Changes in certain body constituents have been found to be early evidence of exposure to vanadium, cobalt, and lead; and a variety of organic compounds may cause changes in enzyme systems. Increased secretion of zinc in the urine is the first response to carbon disulfide. Immunochemical and behavioral responses are other areas being aggressively explored.

A series of experiments in which human subjects have been exposed to chlorinated hydrocarbons has yielded new and significant information. The concentration of the compound in the expired breath was determined by an infrared spectrometer. It was found that the concentration decreased at a regular rate and could be used to estimate the magnitude of an exposure several hours after it occurred.

Safety.—The Eighth President's Conference on Occupational Safety was held March 6–8, 1962, in Washington, D.C. The theme of the conference was "Safeguarding Human Worth." Emphasis was placed on the need for applying tested safeguards to nonmanufacturing industries, since 80% of work injury occurred in these industries in 1960. In addition, safety research and planning was recommended to foresee and control in advance new hazards resulting from scientific and technologic advances. Safety can no longer be an afterthought, but must start with the conception and continue with the development of new products, operating procedures, and services.

Foundation of America, Inc.

INDUSTRIAL PRODUCTION

Industrial production in the United States increased slowly to a new peak in July 1962 and then leveled off. The advance in the first half of the year represented a continuation of the general uptrend which actually began in the early spring months of 1961. The recent overall stability resulted from a mixture of small up-and-down movements among individual industry groups.

The Federal Reserve Board's seasonally adjusted production index of 119 in September (1957 = 100) was 5% higher than at the beginning of the year, more than one sixth above the

1960–61 recession low of February 1961, and 7% above the 1960 prerecession top. About two thirds of the total advance, however, occurred in the first six months of the 1961–62 recovery period. In the comparable 20 months of the 1958–59 recovery cycle, the increase in total industrial production amounted to 25%. (The 1960–61 business downturn was somewhat milder and of shorter duration than the 1957–58 recession, however.)

Production of final products—a comprehensive measure of demand from consumers, business, and government—expanded by 7%, with most end products higher in 1962 than in 1961, although varying in magnitude from product to product.

Table 1—U.S. INDUSTRIAL PRODUCTION INDEX FOR 1960–1962: INDUSTRY AND SUMMARY MARKET GROUPINGS
(1957 = 100)

Classification	1960	1961	Jan.–Sept. 1962[1]
Industry Groupings			
Industrial production, total	108	109	117
Manufacturing, total	108	109	117
Durable manufactures:			
Primary metals	90	88	95
Fabricated metal products	106	105	116
Machinery	106	106	118
Nonelectrical machinery	102	100	112
Electrical machinery	112	114	127
Transportation equipment	102	97	110
Motor vehicles and parts	115	103	123
Aircraft and other equipment	89	91	98
Instruments and related products	119	118	124
Clay, glass, and lumber	109	107	111
Furniture and miscellaneous	116	117	128
Total durable manufactures	104	103	113
Nondurable manufactures:			
Textile, apparel, and leather products	115	116	122
Paper and printing	112	115	119
Chemicals, petroleum and rubber products	118	123	133
Foods, beverages, and tobacco	109	113	116
Total nondurable manufactures	113	117	123
Mining:			
Coal	83	80	83
Crude oil and natural gas	98	100	103
Metal, stone, and earth minerals	105	105	107
Total mining	97	98	100
Utilities, total	123	131	140
Market Groupings			
Total index	108	109	117
Final products, total	111	112	120
Consumer goods	114	116	123
Equipment, including defense	103	104	113
Materials	106	106	114

[1] Seasonally adjusted. (Source: Board of Governors of the Federal Reserve System.)

The expansion in manufacturing production brought about a higher overall rate of capacity utilization in 1962 than in 1961. Even so, a number of basic industries, notably steel and cement, continued to operate well below available capacity.

The four broad industry groups—durables, nondurables, mining, and utilities—and all of the 21 major industry divisions comprising the Federal Reserve index registered output increases over 1961. Durable goods output, paced by motor vehicles and machinery and equipment, increased 12%, and nondurable goods expanded 7%.

In general, production movements for the major product groups in the first 10 months of 1962 followed the pattern of total industrial output—a slow rise in the first half followed by a topping off in the third quarter. Most industries reached new production peaks in 1962 and were operating at or close to record levels in September.

Durable Manufactures.—The steel industry began the year at a fast pace, filling large orders placed late in 1961 and early 1962 for immediate consumption and for inventory buildup as a hedge against a possible industry-wide steel strike during the summer months. After a new labor-management wage contract was signed at the end of March 1962, output fell sharply from a weekly average of 2.4 million tons of ingot steel in March to 1.4 million tons in July, a reduction of more than two fifths. Steel output actually started to move upward after the July 4 holiday week and continued to rise slowly through October 1962, when the industry produced about 7.8 million tons, the highest monthly volume since April.

Total ingot production for the year was expected to reach 98 or 99 million tons, little changed from 1961 and substantially below the high volume years of 1955 to 1957.

Imports of steel mill products again exceeded exports. The January–September 1962 import gap amounted to 1.6 million tons, compared with 1.2 million tons for the entire year 1961. Prior to 1959 exports exceeded imports by a sizable margin. (See also IRON AND STEEL.)

In nonferrous metals (aluminum, copper, lead, and zinc) supplies in the aggregate were at a record rate during the first half of 1962. Higher net imports contributed to the expansion in overall supplies, but the bulk of the increase originated from domestic production. In the third quarter, however, most major producers outside the aluminum industry announced production cutbacks, ranging from 5 to 10%, to limit inventory accumulation. Despite the curtailment, total January–September output was well above the volume for the same period of 1961.

Under pressure of demand for capital goods, the machinery industry had a record output year, increasing volume by 12%, one of the largest year-to-year advances of all manufacturing industries. (See BUSINESS DATA, U.S.) The September index was at a new high rate, one tenth above December 1961 and one sixth above the prerecession peak of July 1960.

Almost all segments of the electrical and nonelectrical machinery industry shared in the expansion. Products showing better-than-average strength included office and store machines, commercial equipment, farm equipment, and industrial electronic products such as computers and data processing equipment.

Among important groups of products showing less than the average industry gain were machine tools, industrial equipment, and household appliances and radio and television sets as a group.

Activity in the aircraft and parts industry, as measured by man-hours worked, held fairly closely to the December 1961 rate, the high for that year. For the nine months through September, output was 5% higher than in the corresponding period of 1961.

All of the expansion in output resulted from the enlarged missile and space procurement programs which constitute an important part of the total activity in the aircraft industry. The importance of this rapidly developing industry is indicated by the fact that employment in aerospace activities has increased steadily while showing consistent year-to-year declines in aircraft plants, although some leveling off occurred in 1962. Of the more than 690,000 employees classified in the aircraft and parts industry in 1962, more than one fifth were engaged in the production of missile and space systems. (See also AERONAUTICS.)

The automobile industry had an active year, the best since the high production year of 1955. With the entire industry in full production of the 1963 models, completions of passenger cars and trucks in October 1962 totaled 840,000 units, the highest since November 1955 and substantially above the monthly average for that year. Produc-

Table 2—LEADING UNITED STATES MANUFACTURES, 1960

Products	Total number of employees (thousands)	Payroll (In millions of dollars)	Adjusted value added by manufacture
Food and kindred products	1,713	$8,268.7	$19,660.5
Meat products	307	1,560.8	2,663.4

All manufacturing establishments[3]	16,726	880,151	1,632,308

[1] Total includes only data for manufactures not classified under other categories. [2] Includes radio and television communication equipment and telephone and telegraph apparatus. [3] Includes administrative and auxiliary units, and includes some industries not separately listed in the table. (Source: U.S. Bureau of the Census, *1960 Annual Survey of Manufactures.*)

tion of American-made cars for all of 1962 is estimated at 8 million, consisting of 6.8 million passenger cars and 1.2 million trucks—about 1.3 million more than in 1961, although still 1.1 million below 1955. Compact or economy type cars accounted for about one-third of the total passenger cars built. (See also AUTOMOBILES.)

Nondurable Manufactures.—In nondurable goods industries, production in the aggregate increased through July and then held steady at a rate somewhat above the December 1961 level. New production peaks were registered at various dates during 1962 for all of the major industry divisions except apparel, leather, and tobacco products.

Chemicals, rubber and plastics, and textile mill products increased by 10% over 1961, the largest among the industry groups. In other soft goods lines the advances were smaller, ranging from 2% for foods, beverages, and tobacco to 6% for paper and products.

In the cyclical textile industry, output in 1962 equaled the previous high (July 1959) in the first quarter, advanced further to a new peak in June, and then edged downward. The lower rate of output in the July–September 1962 period was associated with a drop in unfilled orders, rising inventories, and some price weakness. (See also TEXTILE INDUSTRY.)

Minerals.—Output of minerals averaged somewhat higher in 1962 than in 1961. Each of the three main categories comprising this group shared in the advance, although the increases over the year were small. Production of bituminous coal, an estimated 425 million tons for 1962, was the best in five years, reflecting higher industrial and utility consumption. Crude oil producers increased drilling operations despite a generally unfavorable supply-demand position for refined petroleum products. Extractors of metal, stone, and earth products showed the smallest output increase, as metal mining activity was reduced substantially beginning in July. (See also MINERAL PRODUCTION; MINING.)

Utilities.—The strong postwar growth trend of the utilities industry continued in 1962. The increase in output was about 8½%, compared with a rise of 6% from 1960 to 1961 and an average of 7½% in the 1958–61 period. (See also PUBLIC UTILITIES.)

Annual Survey of Manufactures, 1960.—Preliminary data from this survey, released in 1962, indicate that almost 300,000 manufacturing plants were operating in the United States. Total employment was 16,726,109, including 12,178,965 production workers; the aggregate payroll was $88,015.1 million, including $55,452.1 million for production workers. Adjusted value added by manufacture[1] totaled $163,230.8 million. Capital expenditures in 1960 for new plant and equipment and for improvement of existing equipment approximated $9,968.1 million.

Table 2 furnishes data for all major industry groups and for component manufactures for which adjusted value added by manufacture was estimated at $1 billion or more.

INLAND WATERWAYS

Vessels operating on the inland waterways of the United States, exclusive of the Great Lakes, transported 387,981,193 net tons of cargo in 1961 and accounted for more than 122 billion ton-miles of service. This represented a decrease of 7.3 million net tons from 1960, but an increase of 2.1 billion ton-miles, which means that freight is being hauled over longer distances in the inland waterways trade.

Principal commodities and their tonnages transported in 1961 were: petroleum and petroleum products, 139,173,506; bituminous coal and lignite, 85,883,905; sand, gravel, and crushed rock, 48,708,980; unmanufactured sea shells, 20,041,431; logs, 19,503,710; grain and grain products, 9,000,331; iron and steel, 8,773,594; and chemicals, 5,341,731.

[1] Adjusted value added by manufacture is derived by subtracting the cost of raw materials, parts, components, supplies, fuels, goods purchased for resale, and contract work, from the value of shipments of manufacturing establishments in each industry. It includes the net change in finished goods and work-in-process inventory and also the value added in merchandising activities by manufacturing establishments.

The following table compares tonnages moved over 11 major United States inland waterways in 1961 with tonnages moved in 1960:

Waterway	1960 tonnage	1961 tonnage
Atlantic Intracoastal Waterway[1]	2,829,292	2,763,170
Columbia River	22,152,906	22,807,385
Gulf Intracoastal Waterway	54,948,389	58,866,694
Illinois Waterway	26,928,807	26,691,019
Mississippi River[2]	82,486,236	87,136,590
Missouri River	6,595,947	6,137,230
Monongahela River	29,532,592	26,764,177
Ohio River	79,477,596	80,137,815
Sacramento River	2,120,899	2,077,690
Tennessee River	12,440,696	11,614,674
Warrior-Tombigbee System	5,804,107	6,031,255

[1] Entire waterway. [2] Inland traffic only.

In 1961 there were approximately 1,700 firms engaged in inland waterways transportation. They employed about 80,000 operating personnel aboard the inland fleet. As of Dec. 31, 1960, there were 20,557 vessels available for the transportation of freight on the inland waterways, including 4,052 towboats and tugs with a total horsepower of 2,542,875, and 16,505 non-self-propelled barges of all types with a cargo capacity of 16,355,657 net tons. This compares with 4,139 towboats and tugs with a total horsepower of 2,465,339, and 16,289 non-self-propelled barges with a cargo capacity of 15,649,092 net tons for the year ending Dec. 31, 1959.

During 1961 a total of 576 industrial production plant facilities were developed or expanded on waterside sites. Records for the first three quarters of 1962 show that 369 more such sites were developed, bringing the total number of waterside site plants developed or expanded to 4,447 since The American Waterways Operators, Inc., began keeping records on this activity in 1952.

INSURANCE

The following article is presented in three parts, reviewing developments in: (1) Health Insurance; (2) Life Insurance; and (3) Property and Casualty Insurance.

Health Insurance

By Dec. 31, 1961, a record 136,522,000 persons in the United States were covered by some form of health insurance, and protection against the cost of hospital and doctors' bills had been extended to include about 75% of the nation's population. Nearly $6.4 billion was paid in health cost benefits during 1961 by all types of insuring organizations, compared with $5.7 billion in 1960.

An increase of 60% in the number of persons covered by hospital expense plans was recorded in the last decade. The number of those covered by surgical plans increased 96%, and by regular medical plans, more than 200%. During the same period, major medical expense insurance coverage rose from slightly over 100,000 persons to more than 34 million.

Health insurance policies are handled by more than 800 insurance companies in the United States. At the end of 1961, insurance companies covered over 81 million persons for hospital expenses, 79 million for surgical expenses, and 44 million for regular medical expenses. Loss-of-income insurance policies covered 32 million persons, and more than 34 million policyholders had protection against major medical expenses. Of the total employed United States civilian labor force in 1961, an estimated two thirds (43 million persons) were protected by loss-of-income insurance policies and other formal salary-continuation plans.

In 1961, insurance companies alone paid benefits on an estimated 11 million claims for hospital expenses, representing 47% of the more than 23 million admissions to voluntary hospitals during the year.

As of May 1962, it was estimated that some 55% of the population aged 65 or older had health insurance. In 1952, approximately 26% of the persons in that age group had health coverage; this figure had risen to about 37% in 1956. This progress was due in large measure to new approaches adopted by all insuring organizations in the last decade. One approach enables retiring workers to continue their health insurance coverage; another is the mass-enrollment technique of issuing health insurance to large groups of aged persons in a state.

James R. Williams,
Vice President and General Manager, Health Insurance Institute.

Life Insurance

American families increased their life insurance protection by $50 billion during 1962, as the nation's total life insurance passed $725 billion for the first time. The year ended with $680 billion in force with legal reserve companies and $55 billion with other institutions and the Veterans Administration.

Six out of seven families owned life insurance, with an average of $14,300 each—an increase over 1961 of about $700 per insured family. There were 122 million policyholders with the nation's 1,500 legal reserve life companies.

Although Americans own life insurance mainly to protect their families from financial hardship in case the head of the family should die, another major reason is savings and investment (for retirement and other purposes), a survey showed. Many families also buy policies to guarantee that educational funds will be available for children.

Growth.—Since a generation ago, life insurance protection for American families has grown nearly 10 times faster than the nation's population. An important growth factor has been new types of policies to meet changing needs. For example, a significant development has been group life insurance for workers and their families, which totaled $210 billion in 1962 and covered 50 million Americans, including more than two out of every three civilian nonfarm workers.

Individually purchased "ordinary" life insurance, the nation's main form of protection, also continued to grow rapidly. The 1962 total of $393 billion in force was greater than all other forms of life insurance combined.

Industrial life insurance (issued in small amounts, with premiums payable weekly or monthly) showed little change. Ownership in 1962 totaled $39 billion. Credit life insurance, which pays off a loan if the borrower dies, reached $38 billion in 1962.

New Purchases.—Sales of life insurance in 1962 totaled $78 billion, under nearly 25 million new policies. Ordinary purchases amounted to more than two thirds of the total.

California, which passed New York State for the first time in 1961 as the biggest buyer of ordinary life insurance, continued to lead in 1962, purchasing nearly $6 billion.

Benefits.—Benefit payments to policyholders and their families set new records again in 1962. Over $9 billion was paid under life insurance policies, including $3.9 billion resulting from policyholders' deaths and $5.4 billion in "living benefits" to policyholders themselves. Health insurance benefits totaled $3 billion.

Investments.—Assets of American life insurance companies rose to $133 billion in 1962, an increase of over $6 billion from 1961. Most of these funds are set aside to meet future obligations to policyholders and, until needed, are invested. Investment earnings help reduce the cost of life insurance protection. The largest share is invested in business and industry. More than one third is in home, farm, and commercial mortgage loans.

Canada.—In relation to national income, Canada has for many years reported more life insurance than any other country. (The United States ranks second.) Total life insurance in Canada grew to $55 billion in 1962, an increase of more than $4 billion. Purchases totaled $7 billion, and Canadians received about $650 million in benefits. Assets of Canadian life companies rose to $10 billion.

Blake T. Newton, Jr.,
President, Institute of Life Insurance.

Property and Casualty Insurance

Underwriting results during the first six months of 1962 were similar to the poor experience in 1961 for United States stock property and casualty companies, while the value of investment portfolios dropped steeply from the 1961 level.

The stock market decline in the six-month period whittled away all the gains of the entire previous year. Paper values of portfolios depreciated some $2 billion, causing a drop of about 18% in surplus and 6% in assets.

Despite the sharp dip in security prices, net investment income of insurance companies rose 10%. Since this income exceeds statutory underwriting losses for most companies, the property-casualty business remained in sound financial condition. Dividend pay-out was 6% higher than a year earlier.

Purchases of property and casualty insurance continued to rise. Premium volume in the first half of 1962 increased to about $8 billion, almost 7% over the 1961 figure, largely because of the large volume of car sales. Underwriting results, however, were adversely affected by severe fire losses and a high frequency of wind and hailstorm claims during the winter and spring months, as well as an unsatisfactory record on automobile, compensation, and liability coverages.

Fire losses of $680,408,000 for the first six months of 1962 were about 7% higher than the total of $635,017,000 for the first half of 1961.

The automobile in 1962 once again proved to be the worst killer. While deaths from all types of accidents rose approximately 6% over the toll for January–June 1961, traffic fatalities increased 6.6%, from 16,910 to 18,040.

The total dollar cost of traffic accidents in the United States has quadrupled in 20 years, the combined figure for property damage, legal expenses, medical, surgical, and hospital costs, and loss of income by absence from work amounting to $7.9 billion in 1961, equivalent to $42.93 for every man, woman, and child in the nation.

Automobile insurance is the largest single classification of property-casualty business, with premiums totaling about $5.9 billion in 1961. This was approximately 40% of the overall volume of property and casualty premiums in that year. Although automobile liability insurance is the largest single item, it showed a loss of almost $800 million from 1952 to 1962.

INTER-AMERICAN AFFAIRS

Preoccupation with the Communist-oriented government of Cuba obscured the long-range hemispheric developmental program and strengthened those forces least interested in rapidly paced economic and social reform during 1962. Deteriorating foreign trade and private investment in the Latin countries intensified the polarization of extreme conservative and radical groups. With their domestic support thus weakened, moderate regimes turned to or were overturned by the military whose position on the Cuban crisis more closely paralleled that of the United States.

Punta del Este Conference, 1962.—The Eighth Meeting of Consultation of American Foreign Ministers convened at Punta del Este, Uruguay, from January 22 to 31. The Colombian initiative for a foreign ministers conference on the Cuban problem at the Nov. 9, 1961, Council meeting of the Organization of American States (OAS) had been strongly endorsed by the Caribbean countries and by the United States, although for the larger and more democratic Latin governments (Argentina, Brazil, Chile, and Mexico), representing two thirds of the Latin population, the Cuban issue was a politically divisive one.

U.S. Secretary of State Dean Rusk won respect for his courtesy and tactful diplomacy in persuading the Caribbean countries not to leave the conference when their recommendations for strong action against Cuba were not supported. Except for Cuba (which voted against them all) there was unanimous support for five of the eight declarations which were approved by the foreign ministers: the principles of communism were declared to be incompatible with the inter-American system; Cuba was removed from the Inter-American Defense Board; all countries were encouraged to hold elections; the strengthening of the Inter-American Commission on Human Rights was recommended; and there was expressed support for the Alliance for Progress. With Bolivia abstaining, the foreign ministers directed the OAS Council to establish a five-member Advisory Committee of Experts on Security Measures Against Communist Subversion. Argentina joined a majority of 16 (the 3 other large Latin countries and Ecuador abstained) to recommend immediate suspension of trade in arms with Cuba and to instruct the OAS Council to study the desirability of extending the suspension to other items.

The declaration that Castro's Cuban regime was considered to be excluded from participating in the OAS organs because its Marxism-Leninism was incompatible with the principles of the inter-American system received 14 votes, the minimum required for approval. The four major Latin governments, together with Bolivia and Ecuador, abstained from voting on this declaration; they agreed with Mexico that none of the inter-American treaties provided for the exclusion of any mem-

UPI

President João Goulart of Brazil (r.) arrives at Andrews Air Force Base, Md., on April 3 for talks with President Kennedy.

ber, and even more they feared unwelcome political repercussions within their respective states.

Aftermath of the Punta del Este Conference.—The Latin governments which opposed strong collective action at the foreign ministers meeting had reason to believe that the Cuban problem would solve itself. The Cuban regime was being weakened by the struggle between Castro and the old-line Cuban Communists, and the consequences of economic mismanagement had become evident by 1962. Inexperienced and increasingly disenchanted administrators had replaced the 200,000 professional middle-class exiles. Per capita income had fallen from $374 in 1957 to $185 in 1962. Food rationing was introduced on March 19. The important sugar harvest had dropped from 5 million to 4 million tons, and was largely committed to the Soviet bloc. Cuba's capacity to import Western consumer's products and to export its revolution through arms and subversion was reduced by its loss of dollar exchange. For the first time in its three-and-one-half-year history, the Castro regime found it necessary to quiet a hungry and angry crowd in the port city of Cardenas with a show of armed force on June 16.

To hasten this economic deterioration, President Kennedy imposed an embargo on the remaining Cuban imports to the United States on February 3 (and on March 23 excluded all imports from any country which included elements of Cuban origin, such as tobacco). The action would deprive Cuba of an estimated $35 million exchange annually.

Cuba appealed to the United Nations in an attempt to rally wider international support for its accusations against the United States, and, as U.S. Ambassador Adlai E. Stevenson noted on February 5, "to obscure the decisions against Cuba taken at Punta del Este." A Soviet bloc proposal that the United States be ordered to stop interfering in Cuba's internal affairs was decisively defeated by the Political Committee of the General Assembly on February 15. On February 27 the Security Council refused to discuss the charge that the United States had illegally persuaded the OAS members to exclude Cuba. Cuba's final request to the Security Council that the International Court of Justice rule on the legality of Cuba's exclusion from the OAS was similarly rejected.

The United States could do little to ameliorate the destructive impact of the foreign ministers' debate on Cuba on the internal power structure of the important Latin countries. Violent political clashes between the extreme right and left were unleashed in Uruguay, Chile, Ecuador, Brazil, and Argentina, thereby reducing the effectiveness of the moderate forces in those countries. Military groups, antagonistic to their governments' position at the Punta del Este meeting, forced the Argentine president on February 8, and the Ecuadorean president on April 3, to sever diplomatic relations with the Castro regime. On June 28, conservative members of the Brazilian Chamber of Deputies rejected President Goulart's choice of his foreign minister, Dr. Francisco Dantas, as the new premier, in part because he had abstained on the vote to exclude Cuba from the OAS.

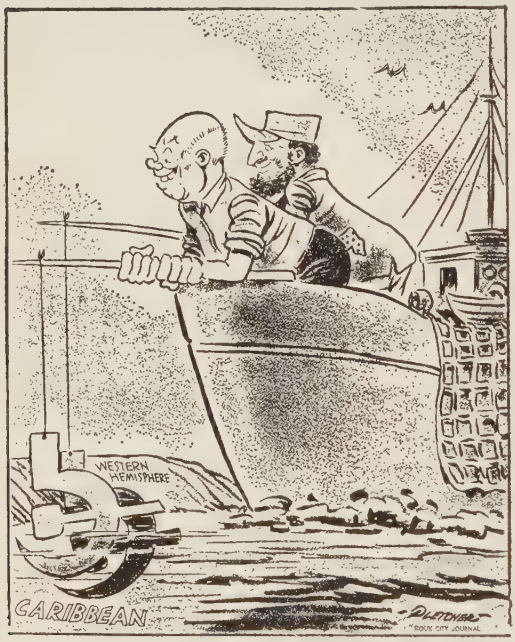
The polarization of antagonistic forces within the larger Latin countries deterred the respective governments from undertaking collective consultation on sensitive political matters within the OAS. Nor were they paying their annual contributions for the financial support of the organization. On Feb. 14, 1962, all but Colombia and Venezuela were delinquent, and Argentina, Brazil, and Cuba together accounted for more than half of the $4 million owed.

Prodded by the United States, the OAS lifted the 16-months-old economic sanctions against the Dominican Republic on Jan. 4, 1962, after President Joaquin Balaguer, who had been closely associated with the Trujillo dictatorship, agreed to resign. When Cuba began on March 29 the secret mass trials of the 1,179 prisoners captured in the abortive Cuban invasion, the Council expressed its "firm hope" that the defendants would be tried fairly by the Castro regime, although the trial had begun with complete disregard for the legal process of human rights. (The prisoners were returned to the United States before the end of the year.) Bolivia, Brazil, and Mexico abstained from voting on the resolution which, they asserted, was intervening in the internal affairs of a country. Ideological reasons persuaded others to support the principle of nonintervention in regard to a military coup d'état in Peru. With only seven governments favoring it, the Council on August 10 decided against holding a foreign ministers meet-

ing on the subject of antidemocratic revolutions.

The 23-year-old Lauca River dispute between Bolivia and Chile proved equally resistant to an OAS settlement. Bolivia withdrew from all OAS activities on September 3, and announced that it would resume its seat only when the OAS took firm steps to bring about a just solution to the dispute.

The political framework of the OAS had so deteriorated by the end of September 1962 that the United States found it necessary to consult with the Latin foreign ministers outside the organizational structure of the inter-American system altogether. The informal meeting was held in Washington, D.C., October 2–3, to strengthen the hemispheric position on the growing Cuban threat. While the conference lacked the power of making recommendations to the OAS Council, it could establish a political posture of hemispheric determination to withstand aggression. This it did with a press statement that Sino-Soviet intervention in Cuba was an attempt to convert the island into an armed base for Communist penetration of the Americas and subversion of the democratic institutions of the hemisphere.



PLETCHER IN THE SIOUX CITY JOURNAL

"Fishing Without a License."

Cuba and the Monroe Doctrine.—The United States policy toward the Castro regime had been one of economic harassment, surveillance, and propaganda—measures insufficiently strong to satisfy the public or Congress. When President Kennedy confirmed on Sept. 4, 1962, the massive Soviet military aid received by Cuba since the last week of July, it was regarded as the boldest challenge yet to the Monroe Doctrine. The 1823 doctrine had declared that the United States would consider any attempt by European powers to extend their system to any portion of the Western Hemisphere as dangerous to its peace and safety. President Kennedy, however, did not view the new military strength of the Soviet-oriented Castro regime as immediately dangerous to the United States. He warned Cuba that the United States would use whatever means might be necessary to prevent aggression against the Panama Canal, the Guantanamo Naval Base, or Cape Canaveral; to intercept offensive movements against the Caribbean governments; and to protect itself from any offensive missile bases.

The United States therefore increased its air and naval surveillance of Cuba. Raids on Cuban vessels and shores from United States territory by Cuban exile groups were countered by mild disapproval and little interference by United States authorities. Cuban exiles were permitted to engage in guerrilla training on an island in the Florida keys. The Department of State unsuccessfully attempted to persuade its Western allies to discontinue all commerce with Cuba (half of the 1,000 calls at Cuban ports between January 1 and September 1 were made by ships flying Western flags).

As the United States congressional elections approached, the public was not satisfied by these half-measures. Cuba was declared to be training thousands of Latin youths in subversion, to be broadcasting Communist propaganda from six powerful transmitters for 22 hours a day, and to be preparing a "fishing base" (to be constructed by the USSR) as a Communist submarine port. Congressional dissatisfaction was reflected in two resolutions signed by President Kennedy on October 4: one called for armed resistance, if necessary, to the forceful extension of aggressive or subversive activities by the Castro regime; and the other gave the president authority to call up 150,000 members of the military reserve to meet possible emergencies.

Cuba and the Cold War.—The discovery by air surveillance of sites for Soviet medium-range (1,200-mile) and intermediate-range (2,500-mile) missiles, as well as jet bombers, in Cuba rescued the Kennedy administration from its political dilemma. The president had been secretly notified of this military escalation of the Cuban problem on Oct. 16, 1962, and four days later the United States determined its first course of action. Since invasion or the bombing of the missile bases in Cuba would tarnish the moral position of the United States in the West and might provoke Soviet counteraction, it was decided to institute a selective blockade on offensive weapons (called a "quarantine" by the president). The mobilization of naval, air, marine, and missile units in the Caribbean area lent credibility to the threat that further action would be taken if preparation of missile sites did not cease. Finally, Soviet Premier Khrushchev was called upon to withdraw the offensive weapons from Cuba. The public was told about the missile sites and the position taken by the United States in a dramatic radio-television statement by President Kennedy on October 22.

The Council of the OAS was convoked in emergency session as a provisional Organization of Consultation under the Rio Treaty at 9 A.M. on October 23. Secretary of State Dean Rusk represented the United States and offered a resolution to authorize the use of force, individually or collectively, to enforce the blockade (the deputy legal adviser in the State Department had declared that the blockade would be less illegal if supported by the Latin governments) and to prevent the missiles from ever becoming an active threat; to call for the immediate withdrawal of offensive weapons; and to inform the UN Security Council of these enforcement measures.

Confronted by the sudden reality that the Cuban-based Soviet missiles endangered their own countries, the Latin governments, in a surprising demonstration of unanimity, approved the resolution at 5 P.M. that evening. The United States blockade was thereupon declared to become effec-

tive at 10 A.M., October 24, and more than half of the Latin governments offered military support, including two Argentine destroyers which arrived in Trinidad on November 8 to join in the blockade operations. The Latin diplomats at the Pan American Union once again supported the United States on October 26 when they made it known that the resolution of October 23 did indeed authorize the dismantling of missile bases by force if necessary. Should the Soviet leaders fail to heed United States warnings, they would confront a unified hemisphere.

Ambassador Adlai E. Stevenson carried the United States complaint on Soviet missile bases to an emergency session of the UN Security Council on October 23. On October 30 the acting secretary general and a score of aides flew to Cuba for discussions regarding a United Nations inspection of the dismantled missile bases. To provide a better atmosphere for the talks, the United States suspended its sea blockade and aerial surveillance for three days. Premier Castro declared, however, that the USSR had not consulted him about the proposed United Nations inspection and that he had no intention of agreeing to it.

The Soviet leaders had been stunned by the public revelation of their duplicity, and were impressed not only by the determined stand taken by the Kennedy administration but also by the overwhelming support accorded it by Latin America and the West. The embargo, as it developed, was effective largely because of its psychological impact; only one Soviet-chartered freighter was searched, and when no contraband was disclosed, it was allowed to proceed to Cuba. Of the 25 Soviet ships enroute to Cuba, 12, presumably with incriminating cargoes, were redirected to their home ports on October 25. Not until October 28, however, was it clear that an armed clash had been avoided.

Only then did the USSR agree to discontinue work on the missile bases, to return the missiles to the USSR, and to permit United Nations representatives to "verify" the dismantling. By November 8, United States aerial reconnaissance indicated that all known missile bases had been dismantled; within the next three days, United States naval units had, by agreement with the USSR, counted 42 missiles on the decks of Soviet ships outbound from Cuba.

WIDE WORLD

During the conference of foreign ministers of the Organization of American States, at Punta del Este, Uruguay, January 30, delegates from Nicaragua (left) and Paraguay (right) raise their hands to signify approval of a resolution calling for free elections in all American states. In this vote, as in most of the others, the sole dissenter was President Osvaldo Dorticós Torrado of Cuba (center).

For his part, President Kennedy pledged that Cuba would not be attacked or invaded by the United States. The United States guarantee of Cuban territory, however, awaited on-site inspection of the missile sites and the withdrawal from Cuba of 42 Soviet jet bombers—to both of which the Castro regime was adamantly opposed.

Soviet pressure apparently forced Castro to alter his position, however; on November 20, President Kennedy announced that Khrushchev had promised to remove all the jet bombers from Cuba by December 20. As a result, the United States lifted its naval "quarantine" of the island. By December 7, all 42 of the jet bombers were reported to have been removed on Soviet ships.

The prestige of Premier Castro was seriously dimmed by the crisis. While he continued to resist on-site inspection, the unreliability of his Soviet ally had been amply demonstrated. The Chinese Communists were now supporting Castro, but he had sided against their youthful, sectarian extremists within Cuba the previous March, and could not expect that China was capable of replacing Soviet economic assistance.

In addition, Castro had incurred the suspicion of Latin governments and leftist groups which heretofore had been sympathetic to his cause. Some Latin extremists, to be sure, responded to

(*Left*) At the emergency meeting of the Organization of American States on October 23 in Washington, D.C., at which the United States quarantine of Cuba received unanimous support, Secretary of State Rusk (seated) talks with Roberto Alemann, the Argentine ambassador to the United States. WIDE WORLD

his orders. In Venezuela they damaged United States gas and oil installations, but their documented actions there were subjected to OAS review. In Brazil, however, Leonel Brizola, leader of the radical nationalist left and persistent critic of United States policies, declared that the "Soviet Union has taken advantage of the Cuban people for its own ends simply as an instrument for its own power." In a letter to the Cuban president, the Mexican president declared that his government "cannot view with indifference a Latin American country establishing facilities for the utilization of the most destructive weapon of all times."

Political Stability.—Deteriorating economic conditions fostered political extremism in the five presidential and eight congressional elections held in Latin America in 1962. Budget deficits, rampant inflation, and growing unemployment were most serious in those countries—Argentina, Brazil, and Chile—where the general public had been most influential in the political structure. Internal unrest was intensified by decisions at hemispheric meetings regarding the Cuban problem.

Faltering democratic processes favored the ascendancy of military groups; by the end of the year these groups were dominant in all but ten of the Latin countries.

Argentine army and navy forces deposed and arrested President Arturo Frondizi on March 28 and compelled his successor, Jose Mario Guido, to cancel the results of the March 18 elections in which Peronist candidates won 47 of the 85 congressional seats and 10 of the 14 provincial governorships.

Encouraged by the Argentine example, the Peruvian military imprisoned President Manuel Prado y Urgateche on July 18, two weeks before his term expired, and voided the June 10 presidential elections which had given the leftist Aprista candidate a plurality.

Enthusiastic support for the 12-man military junta, led by Gen. Ricardo Perez Godoy, came from Peruvian business, land-owning, church, and Communist groups. President Kennedy, who had declared on July 18 that this action was a serious setback for the Alliance for Progress, recognized the junta on August 17, but withdrew all further military assistance pending new elections on June 9, 1963.

An alliance between the military and a conservatively oriented coalition cabinet in Ecuador maintained vigilant scrutiny over subversive activities (about 40 pro-Castro guerrilla youths and sizable quantities of ammunition were seized on April 5).

The reform-minded Salvadorean administration of Col. Julio A. Rivera, whose election on April 29 was unopposed, joined ranks with the country's oligarchic financial rulers against the rapidly expanding left in October.

The administration of Romulo Betancourt in Venezuela depended increasingly on the uncertain loyalty of the military. The conservative opposition to the reform government was now joined by non-Communist, left-wing disenchantment with the moderation of the Betancourt regime. The mounting violence throughout the country (two major uprisings by leftist-supported marines and military leaders at Carupano in May and Puerto Cabello in June), and in Caracas (a three-day riot in January and ten days of terrorism by civil and military elements in October) had resulted in constitutional guarantees being suspended for most of the year, and had provoked the government to request the Supreme Court to outlaw both the Communist Party and the Movement of the Revolutionary Left on October 15.

The Venezuelan experience indicated that political stability would not be maintained by military control alone, when military leaders were split by opportunism and ideology. There was growing evidence of a serious rift among the Brazilian military in November as the consequence of the appointment of "nationalist" and "political activist" officers to cabinet posts and major military units. Rival military groups waged an ugly civil war in Argentina, September 20–22, for leadership positions. The winning faction rejected a five-year "democratic dictatorship" which they charged their conservative opponents were advocating. They were also more sympathetic to Peronist aspirations, and to advancing the date for national elections.

Elsewhere, the military maintained its historically dominant role. In Haiti the despised Civil Milice, without regular salaries, uniforms, or drill, and the armed thugs of the Ton Ton Macoute replaced the armed forces as the major support of the Duvalier regime; the Guatemalan military, acting under a 30-day state of siege, subdued student demonstrations and arrested moderate leftist leaders on January 25. Supported by the military, the church hierarchy, and a confidential fund of over $1 million, Guatemalan President Miguel Ydígoras withstood continuing demands by student and professional groups that he resign in March and April. Meanwhile, business and land-owning elites strengthened their position in a number of countries, and labor and student groups exercised occasional influence on their respective governments.

Military Assistance Program.—Inter-American military programs were directed in 1962 against potential threats to strategic Caribbean bases (symbolized by the Soviet missile installations and "fishing port" in Cuba) and Soviet-Chinese-Cuban inspired sabotage; they were also being used constructively for economic development. Critics of the programs charged that they had contributed more to internal wars than to hemispheric defense and that they had encouraged an arms race in countries with already overburdened military budgets. (In fiscal 1962, total United States military aid to Latin America amounted to $76.1 million, of which one third went to Brazil, $10.7 million to Peru, $2.2 million to Haiti, $1.7 million to Nicaragua, and $1.1 million for regional programs.)

United States military training programs in the Canal Zone were expanded in July with the inauguration of the Inter-American Police Academy at Fort Davis; 100 Latin middle- and senior-level police officials were schooled in modern police methods during the 12-week course. The jungle warfare center at Fort Sherman had graduated 364 Latin military officers in the three years of its operation. An Inter-American Defense College was opened at Fort McNair, Va., on October 9. In March, a 44-man United States military mission began a long-range program to retrain the Dominican forces as an efficient antiguerrilla organization to subdue Cuban-trained extremist youths.

Central American governments received coast guard cutters to patrol their Caribbean shores against illicit Cuban arms. Mexico purchased 20 United States minesweepers for this purpose in July. In Ecuador, the Military Civic Action Program was being expanded with the construction of irrigation canals, roads and airports, and health and educational facilities.

South American navies participated in antisubmarine maneuvers with United States warships in September and October. The first military maneuvers (based in Honduras) held jointly with four Central American countries and Colombia, September 4–5, provided a warning to potential Communist infiltration.

Social and Economic Development.—The Alliance for Progress program for government-sponsored tax, land, and administrative reforms was frustrated by the resurgence of powerful conservative groups and by a lack of capital resulting from a deterioration of trade and private investment. Inequitable tax burdens favored the wealthy, and tax evasion was widespread. Where nominal land-reform programs were adopted, their implementation was handicapped by economically restrictive provisions and by resistance from important groups.

The faltering progress of social reform reflected the economic stagnation in Latin America. Only two Latin countries averaged more than a 2% per capita annual growth in 1957–62 (the Alliance goal was 2.5%), while the rest failed to keep pace with a 2.9% population growth. The prices of major exports—mostly agricultural products, minerals, and petroleum—had fallen. Between 1957 and 1960 the overall price decline amounted to 11.5%, effec-

tively canceling out a 13.5% increase in volume of goods sold abroad. Foreign exchange available for imports in 1961 ($7.19 billion) and private foreign investment in 1961 ($642 million) had not registered a discernible growth in the four-year period, although the Latin population had increased 12% during that time.

Under these circumstances, United States government assistance made little impact on the Latin economies. The Kennedy administration had more than fulfilled its promise to extend $1 billion in aid during the first year of the Alliance program. (Between March 13, 1961, and March 1, 1962, the U.S. government had committed $1.03 billion, 87% of which was in the form of long-term loans. The Export-Import Bank of Washington supplied $361 million; the Agency for International Development, $402 million; the Social Progress Trust Fund administered by the Inter-American Development Bank, $130 million; the Food for Peace Program, $136 million; and the Peace Corps, $1.9 million.) However, an estimated $400 million of the total United States commitments was used to bring short-term relief to debt-ridden economies through the form of export refinancing or balance-of-payment loans. In addition, only a quarter of these commitments had been disbursed by March; the rest required loan agreement negotiations with the respective government officials.

Alliance for Progress.—The first annual review of the Alliance for Progress was undertaken at Mexico City by the Inter-American Economic and Social Council (October 7–21), followed by a meeting of the inter-American ministers of finance (October 22–27). The United States was concerned that the Latin American countries viewed the program as a North American charity and not in terms of self-help. Only five of the Latin governments had drafted 10-year developmental programs, and many of the others had been unable or unwilling to meet United States conditions for assistance. However, U.S. Secretary of the Treasury Douglas Dillon announced his government's willingness to commit $413 million in expanding the capital authorization of the Inter-American Bank by $1 billion, and to replenish the $375 million Social Progress Trust Fund of the bank.

To meet Latin complaints against United States administrative delays in approving Alliance credits, six permanent committees were established to recommend improved procedures. Former Presidents Juscelino Kubitshek of Brazil and Alberto Lleras Camargo of Colombia were assigned the task of developing and propagating a convincing doctrine for the Alliance, which, it was recognized, had not been properly understood in the Latin countries.

INTERIOR DECORATION

The year 1962 was characterized by three significant events in the interior decorating field. The first in importance was the announcement by Mrs. John F. Kennedy, in February, of the restorations completed in the White House under the supervision of the National Fine Arts Commission. Results of the restoration, shown by Mrs. Kennedy in a televised tour, followed years of indifference and neglect of the historic mansion. Among the rooms so restored, and accepted by the first lady on behalf of the nation, were the Diplomatic Reception Room, completed as a gift, with furnishings, by the National Society of Interior Designers; and the White House Library, completed as a gift, with furnishings, by the American Institute of Interior Designers (AID).

The second important event in interior decoration was the opening in April of the Seattle World's Fair, with its Fashion Pavilion, featuring furnishings in attractive settings, jointly sponsored by the American Institute of Interior Designers and its Resources Council. The pavilion, a large, low building, was located directly behind the Space Needle, a spire topped with a revolving restaurant, itself a notable achievement in interior decoration by Don Robbins.

The third event of national interest was the exhibition, "Treasures of Versailles," at the Art Institute of Chicago, commemorating the opening of the new Sterling Morton Wing for the showing of additions to the institute's collections. The exhibition featured two entire historic rooms from Versailles as well as a gallery of French masterpieces, including furniture, paintings, and *objets d'art*.

The year of contract decoration, including work other than residential, was made notable by such distinguished and diverse installations as the first of the series of buildings at the Lincoln Center for the Performing Arts, in New York City; the branch store of Strawbridge & Clothier, of Philadelphia, by Welton Becket & Associates; the brokerage offices of Edward F. Hutton & Company, in New York, by Virginia Conner Moseley; the new Seattle Hilton Inn, by Welton Becket & Associates, with modern art featured as an integral part of the overall decorating concept; the Austin, Texas, Club, by Revell & Company; the clubhouse for Paradise Island, the Bahamas, by Mildred Hull; Georgetown Inn, Washington, D.C., by Ludliner & Himmel; and the Charlotte City Club, in North Carolina, designed by Ellen L. McCluskey, with backgrounds designed for 18th century furnishings.

From 650 entries, 43 designers and manufacturers of interior furnishings were cited by AID International Design Awards in the 17th annual presentation in Chicago. Several of the awards were given for designs of international origin; and of special interest was a series of fabric designs by American Navajo Indians.

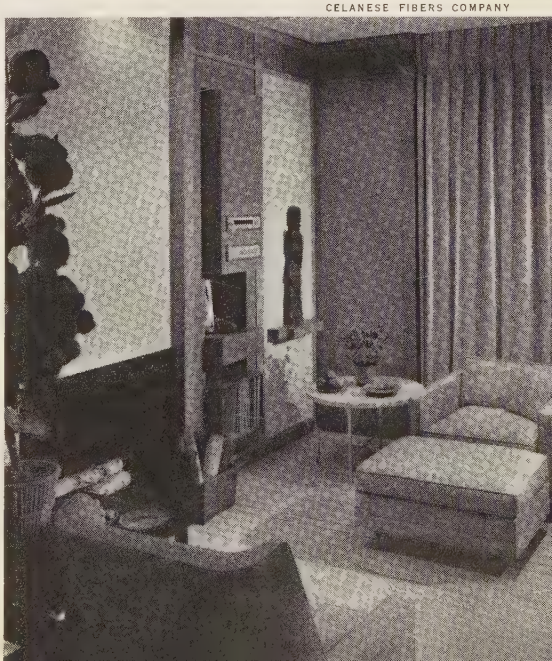
Authentic reproductions of ancient Greek furniture were re-created by T. H. Robsjohn-Gibbings for Saridis, of Athens, and displayed at Tiffany's, New York City.

Included in the outstanding exhibits by the National Design Center, in New York City, was "Panorama," which focused attention on the house in an imaginative display of furnishings for every room by Tom Lee.

Furniture.—The furniture industry was more active than ever before in its history, its seasonal output (marked by spring and fall market showings

This prize-winning living room design by Marvin Sharpe is highlighted by fabric-covered panels on each side of the fireplace that conceal stereo high-fidelity components.

CELANESE FIBERS COMPANY



with record attendance in Chicago, Grand Rapids, and High Point) presenting a cross section of its productivity in all phases. Styling of Southern lines was characterized by better design quality, more refined workmanship, and with custom touches heretofore available only in the lines of Northern manufacturers, resulting in a much longer list of resources for showrooms and interior decorators looking for finer merchandise to offer on projects having budgetary restrictions.

The fashion in furniture was to mix and blend —not match—woods, styling, and finishes. The groupings were designated as "collections" or "ensembles," with the term "suites" no longer featured. In styling, 18th century French designs dominated, followed by Georgian examples (including revivals of Hepplewhite and Sheraton) which stole the spotlight from American Colonial. Middle East and Far East designs were influential in the more impressive schemes of decoration; and rustic Spanish renditions, with Gothic and Renaissance overtones, were seen in many manufacturers' lines, auguring an important design trend for the future.

Fabrics and Floor Coverings.—There was evident in 1962 a trend toward a country manor house style of decorating, featuring such elements as beamed ceilings, mellow woods, and patterned fabrics in darker, richer hues, and producing an all-over effect of luxury with restraint. Texture, therefore, was a natural development, and was stressed in fabrics and wall coverings, as well as in floor coverings. New fabrics in the "American Legacy" series, by Greeff, reproduced patterns in authentic 18th and 19th century weaving and painting from the Henry Ford Museum. Herbert Bright made new developments in flooring with his fabrics laminated in vinyl, and tiles of pebbles and stones of all sizes and colors embedded in plastic. Outstanding, also, was the striking Amtico vinyl flooring which reproduced malachite in coloring and marking, with crystals added to give a true reproduction.

Altogether, the 1962 "look" was one of restraint. The profiles of furniture were softer and shapelier, and the interplay of various decorative materials was employed in refined and pleasing combinations, highlighted by such accents as leather, tile inlays, slate, and parquet.

INTERNATIONAL ATOMIC ENERGY AGENCY. See ATOMIC ENERGY.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT

This international lending agency, also known as the World Bank, began operations in June 1946. It is owned by its member countries which, by the end of 1962, numbered 81. It makes loans to member governments and, with the guarantee of the government concerned, to their territories, public agencies, or private enterprises. The bank's subscribed capital is $20,663 million; 10% is paid in, and the balance is subject to call only to meet the bank's obligations. Loan funds come from the paid-in portion of capital subscriptions, and from borrowings and net earnings. By September 1962 these subscriptions amounted to $2,056 million; the outstanding funded debt was $2,533 million; and net earnings totaled $489 million. Bank funds are also replenished by the sale of parts of loans to outside investors; such sales totaled $1,352 million by September 1962.

On Oct. 24, 1962, the executive directors selected George D. Woods as president of the bank (effective Jan. 1, 1963) to succeed Eugene R. Black, who retired after having held the position for 13 years.

Activities in 1961–62.—During the fiscal year ending June 30, 1962, bank lending reached a new high; 29 loans totaling $882.3 million were made in 19 countries. This brought total loans to 321, aggregating $6,544 million in 60 countries or territories. More than half the year's lending, $493.5 million, was for the expansion of electric power in Argentina, Australia, Colombia, Ghana, Mexico, the Philippines, South Africa, and Trinidad and Tobago. Transport loans totaling $241 million were for highway development in Colombia, Costa Rica, Japan, Mexico, Peru, and Venezuela; for railways in India and South Africa; and for port improvements in India and the Philippines. Industrial loans for development banks in India, Austria, Costa Rica, and Ethiopia, and for specific projects in India, Finland, and Israel amounted to $134.5 million. The year's operations also included loans of $8.4 million for land settlement in Kenya, $2.9 million for telecommunications in Ethiopia, and $2 million for the hot water heating system in Iceland.

During the year a new Development Services Department was established to administer the bank's technical assistance work, which among other things includes serving as executing agency for the UN Special Fund projects. Of special importance was the inauguration of the Development Advisory Service, through which the bank provides a corps of highly experienced professionals to serve as advisers to member governments.

The bank is also becoming more active in the investigation and preparation of projects for possible financing and, where appropriate, in studying whole sectors of the economy of a member country to provide the basis for sound investment planning. During the past year the bank organized and helped to finance such studies in six countries.

International Development Association.—IDA came into existence as an affiliate of the World Bank in September 1960. Its purpose is to provide funds for economic development on terms more flexible and bearing less heavily on the balance of payments of recipient countries than those of conventional loans. Membership in IDA is open to World Bank member countries; by September 1962, 67 countries had joined and their subscribed capital totaled $942.6 million. Members are divided into two groups: the more industrialized countries, whose entire subscriptions are to be paid over five years in gold or freely convertible currencies; and the less developed countries, which pay only 10% of their subscriptions in this form and the remainder in their national currencies.

By September 1962, IDA had extended 29 credits totaling $347.6 million in Chile, China, Colombia, Costa Rica, Honduras, India, Jordan, Korea, Nicaragua, Pakistan, Paraguay, Sudan, Swaziland, and Tunisia. The credits are assisting the development of electric power, transportation, communications, agriculture, industry, municipal water supply, and education. Each of the credits is for a term of 50 years. After a 10-year period of grace, 1% of the principal is repayable annually for 10 years, and 3% is repayable annually for the final 30 years. The credits are free of interest, but a service charge of three fourths of 1% per annum on the amount withdrawn and outstanding is made to meet IDA's administrative costs.

INTERNATIONAL LAW

Principal developments in international law during 1962 included decisions by the International Court of Justice involving a temple in Southeast Asia and the financial obligations of United Nations members.

International Court of Justice.—Judgment on the merits in the dispute between Cambodia and Thailand concerning sovereignty over the Temple of Preah Vihear was given by the court on June 15, 1962 (*I.C.J. Reports 1962*, p. 6).

The temple ruins are situated in the Dangrek range of mountains along the boundary between Thailand and Cambodia, which until 1953, when it gained independence, was part of French Indochina. Prior to 1904 there was tension between the two countries due to uncertainty over the precise location of the long frontier. On Feb. 13, 1904, France and Siam (as Thailand was then called) concluded a boundary treaty providing that in the Dangrek sector the boundary should follow the watershed line; it was also agreed that a mixed commission should delimit the frontier on the ground. Maps were eventually prepared by French authorities at the request of the Siamese commissioners. It appears that these were not submitted to the commission before it disbanded and, therefore, lacked binding character. In 1908, however, the maps were officially transmitted to Siam. One showed the Preah Vihear area to be in Cambodia, although the boundary did not follow the watershed.

The court reviewed several opportunities when Siam could and should have challenged the boundary and found that it had failed to do so, even as late as 1947. At that time Siam claimed several frontier rectifications before the Franco-Siamese Conciliation Commission in Washington, D.C., but none related to the contested area. Thailand argued before the court that since it had in fact exercised sovereignty, it did not have to raise the question. The court dismissed this argument, first, because the acts were performed by local and minor officials, and second, because Thailand failed to challenge France when in 1930 it asserted sovereignty over the area. In 1949 and 1950, France—and in 1953 and 1954, Cambodia—questioned the presence of Thai policemen and keepers and requested their withdrawal, but Thailand failed again to raise a claim on the diplomatic level.

The court held that Thailand was precluded by its own conduct from pleading error regarding the map; that it had in fact accepted the line drawn on the map; that having enjoyed for 50 years the benefits of a stable frontier, Thailand could not now challenge it; that both parties had accepted the line as fulfilling the terms of the treaty; and that this agreement resulting from their conduct superseded the watershed line provided for in the treaty. Accordingly, the court, by a vote of 9–3, ruled that the temple was situated in territory under the sovereignty of Cambodia, and that Thailand was obligated to withdraw its police forces and keepers from the area. By a vote of 7–5, the court ruled that Thailand was obligated to return to Cambodia any sculptures, fragments, and ancient pottery that may have been removed from the temple since 1954.

The court pointed out that the chief objective of a boundary settlement is to establish certainty and finality by means of natural and visible lines. The line on the map, though not following the watershed, satisfied this requirement and therefore the intent of the treaty. The adverse judgment, which caused some domestic difficulties for the Thai government, was reported to have been executed.

On Dec. 20, 1961, the UN General Assembly voted to request the court for an advisory opinion as to whether expenditures authorized in several resolutions for the purpose of financing the United Nations Emergency Force in the Middle East (UNEF) and the United Nations Operations in the Congo (ONUC) constituted "expenses of the Organization" within the meaning of Article 17, par. 2, of the UN Charter. The court on July 20, 1962, by a vote of 9–5, answered the question in the affirmative (*I.C.J. Reports 1962*, p. 151).

The court considered first whether the term "budget" in Article 17, par. 1, should be construed as being limited to "administrative" or "ordinary" as distinguished from "operational" or "extraordinary" budgets. It found that in practice the organization from its beginning had included items in the budget which could not be regarded as falling in the first category. The court saw no reason for challenging the legality of this settled practice.

Turning to the interpretation of Article 17, par. 2, in the context of the Charter, the court dismissed as unfounded the argument that the General Assembly could take no action whatsoever, and therefore could not incur expenses, in connection with the maintenance of international peace and security. Article 11, par. 2, of the Charter was intended only to preclude the Assembly from taking action which was exclusively within the authority of the Security Council, namely, enforcement action. The court also concluded that Article 43 of the Charter did not constitute a limitation on the budgetary power of the Assembly. The agreements provided for in this clause concerning armed forces, assistance, and facilities to be made available by members to the Security Council had, in the first place, not yet been concluded; and, in the second place, even had they been made, it might still be necessary to provide financial assistance to the members. The Assembly had authority to do so. Moreover, the absence of these agreements did not render the Security Council impotent in the face of an emergency. The Security Council certainly has the power "to police a situation even though it does not resort to enforcement action against a state." The financial burden of such action would constitute "expenses of the Organization within the meaning of Article 17, par. 2."

UNITED NATIONS

International Court of Justice at The Hague, Netherlands, advised on July 20 that United Nations members had to pay assessments for operations in the Congo and Middle East.

Finally, the court held that, in determining whether the actual expenditures referred to in the request of the Assembly constitute expenses of the organization, "such expenditures must be tested by their relationship to the purposes of the United Nations in the sense that if an expenditure were made for a purpose which is not one of the purposes of the United Nations, it could not be considered an 'expense of the Organization'."

The primary purpose of the organization is the

maintenance of international peace and security. Even if an action serving this purpose is taken by the wrong organ or in an incorrect manner, it would not follow that the expense incurred would not be an expense of the organization. Specifically, UNEF was established by the General Assembly acting within its powers and with the consent of Egypt and therefore it did not constitute enforcement action. The secretary general of the United Nations was authorized to incur the required financial obligations. They constitute expenses of the organization. The fact that they were carried in a special account was considered immaterial. The measures relating to the Congo are not enforcement action; they were initially taken by the Security Council at the request and with the consent of the Congo, and confirmed by the Assembly, and the expenses incurred by the secretary general constituted an obligation of the organization. The Assembly had authority to apportion them in accordance with Article 17, par. 2.

This opinion deals with the most important matter ever referred to the court by the Assembly for an advisory opinion. The Soviet Union deemed it sufficiently significant to be represented for the first time in oral hearings held by the court. The import of the opinion lies in the determination that the expenses involved in the police operations in Egypt and the Congo are legally binding on the members, and that those failing to pay their assessed contribution expose themselves to the penalty provided for in Article 19. According to this article, "a Member of the United Nations which is in arrears in the payment of its financial contributions to the Organization shall have no vote in the General Assembly if the amount of its arrears equals or exceeds the amount of the contributions due from it for the preceding two full years."

The financial difficulties of the United Nations were in large measure due to the fact that a substantial number of members, including the USSR and France, failed to pay their assessments for UNEF and ONUC on the ground that they were not legally binding. Under this opinion, accepted by the General Assembly on Dec. 19, 1962, the defaulting members expose themselves to the loss of their vote in the Assembly as soon as the condition of Article 19 is met, unless the Assembly is satisfied "that the failure to pay is due to conditions beyond the control of the Member." In the meantime, the Assembly authorized a bond issue to meet the deficit and ensure the solvency of the organization, as well as the continuation of these vital actions.

At the hearing held on March 1, 1962, the president of the court, Judge Bohdan Winiarski of Poland, delivered an address to note that on Feb. 15, 1922, the predecessor of the present court, the Permanent Court of International Justice, held its first sitting. That day was "outstanding in the history of international law." It marked the establishment for the first time of a truly permanent institution of international justice. The court was not merely "the principal judicial organ of the United Nations" but "first and foremost the organ of international law."

International Law Commission.—In the course of its 14th session, April 24–June 29, 1962, the commission discussed draft articles on the law of treaties and surveyed its program of work in the light of recommendations formulated in General Assembly Resolution 1686 (XVI) of Dec. 19, 1961. The commission decided to give priority to the formulation of the law of treaties and to include two additional main topics in its program: the law of state responsibility, and succession of states and governments. Departing from its usual method, the commission appointed subcommittees for these topics to meet in January 1963 and submit reports to the commission. The commission also decided to include in its program four topics of more limited scope which were referred to it by the General Assembly: the question of special missions, the question of relations between states and intergovernmental organizations, the right of asylum, and the juridical regime of historic waters, including historic bays.

Treaties.—From June 16, 1961, to June 15, 1962, 724 treaties and international agreements were registered with the UN Secretariat, 11 treaties and agreements were filed and recorded, and 457 certified statements were registered or filed and recorded, bringing the total since 1946 to 9,255 treaties and agreements, and 2,824 certified statements. During the year the Secretariat published 27 volumes of the United Nations *Treaty Series*, and an additional 33 volumes of instruments registered or filed and recorded prior to the end of 1961 were expected to appear in 1962. Four instruments were drawn up under the auspices of the United Nations, raising the total of instruments for which the Secretariat is the depository from 157 to 161. During the period under review, 107 signatures were added to these agreements, and 263 ratifications, accessions, or notifications were received by the Secretariat. Two additional agreements have entered into force, raising the total from 109 to 111, namely: the Convention on the Contract for the International Carriage of Goods by Road (May 19, 1956) and the European Convention on Customs Treatment of Pallets used in International Transport (Dec. 9, 1960).

During the period from Aug. 31, 1961, to October 1962, the U.S. Department of State added over 300 instruments to its *Treaties and Other International Acts Series* (*TIAS*) raising the total to 5,093.

Professor of International Law, The Fletcher School of Law and Diplomacy, Tufts University.

INTERNATIONAL MONETARY FUND

The Board of Governors of the International Monetary Fund (IMF) held its 17th annual meeting in Washington, D.C., Sept. 17–21, 1962. One of the outstanding features of the past year has been the movement toward greater international monetary cooperation. Arrangements were negotiated to replenish the fund's resources by borrowing up to $6 billion in case of need, from 10 industrial countries. These new developments can be expected to lead to a strengthening of the world monetary system; they also hold out hope for a closer coordination of economic and financial policies among the industrial countries, to the benefit of all nations.

The 12-month period ended Sept. 30, 1962, was the most active, from the standpoint of financial operations, in the history of the fund. Purchases equivalent to $636,050,000 were made in nine currencies—U.S. dollars, deutsche marks, French francs, Italian lire, sterling, Netherlands guilders, Belgian francs, Swedish kronor, and Austrian schillings. The purchases were as follows, by countries and amounts: Argentina, $110,000,000; Bolivia, $2,000,000; Canada, $300,000,000; Ceylon, $11,250,000; Colombia, $7,500,000; Costa Rica, $10,000,000; Ecuador, $7,000,000; El Salvador, $2,000,000; Ghana, $14,250,000; Guatemala, $5,000,000; Haiti, $3,750,000; Honduras, $3,750,000; India, $25,000,000; Indonesia, $21,250,000; Nicaragua, $1,500,000; Philippines, $28,-

300,000; Syrian Arab Republic, $3,600,000; Turkey, $15,000,000; United Arab Republic, $59,900,000; and Yugoslavia, $5,000,000.

The IMF agreed to stand-by arrangements, permitting drawings for one-year periods, with Argentina, $100,000,000; Bolivia, $10,000,000; Colombia, $10,000,000; Costa Rica, $15,000,000; Ecuador, $5,000,000; El Salvador, $11,250,000; Haiti, $6,000,000; Honduras, $7,500,000; Iceland, $1,625,000; India, $100,000,000; Japan, $305,000,000; Paraguay, $5,000,000; Peru, $30,000,000; Philippines, $40,400,000; United Arab Republic, $42,500,000; and United Kingdom, $1,000,000,000. A six-month stand-by arrangement for $6,600,000 was agreed to with the Syrian Arab Republic, and this was extended for two months beyond its expiration date of Sept. 30, 1962; and a nine-month stand-by arrangement for $31,000,000 was agreed to with Turkey. The stand-by arrangement with Iran for $35,000,000 was extended from Oct. 10, 1961, to March 20, 1962.

Total transactions between March 1, 1947, when the IMF commenced operations, and Sept. 30, 1962, were equivalent to $6,714,327,102. Of the currencies purchased during the 12-month period ended Sept. 30, 1962, 84 percent was in currencies other than U.S. dollars. During this 12-month period, 22 IMF members made total repurchases of their currencies equivalent to $1,729,033,732, of which $78,243,670 was paid in gold and $1,010,493,268 in U.S. dollars.

New par values were agreed on with Israel, 33.3333 U.S. cents per Israeli pound; and Canada, 92.5 U.S. cents per Canadian dollar. Initial par values, given per U.S. dollar, were agreed on as follows: 0.359596 New Zealand pound, 28.75 Portuguese escudos, 0.357143 Cyprus pound, and 3.06122 Malayan dollars. Seventeen fund members had not agreed initial par values with the Fund.

During the period ended Sept. 30, 1962, eight new members joined the Fund: Cyprus, Liberia, Togo, Senegal, Somalia, Sierra Leone, Tanganyika, and Kuwait. The quota for each of these countries was $11,250,000, except for Senegal ($7,500,000), Tanganyika ($25,000,000), and Kuwait ($50,000,000). Terms and conditions of membership were approved by the Board of Governors for the Central African Republic, Chad, Congo (Brazzaville), Dahomey, Gabon, Niger, and Upper Volta, with quotas of $7,500,000 each; Cameroon, Guinea, and the Ivory Coast, with quotas of $15,000,000 each; and Jamaica, with a quota of $20,000,000. Applications for membership were received from Mali, Trinidad and Tobago, Congo (Léopoldville), Burundi, Malagasy Republic, Rwanda, and Uganda.

FRANK A. SOUTHARD, JR.,
United States Executive Director.

INTERNATIONAL TRADE

Free-world exports resumed a strong upward movement in 1962. After a lull in the previous year, the renewed thrust was expected to raise the export total by as much as 6% above 1961—to $125 billion or $126 billion. This increase brought the volume of world trade to a level one third higher than that of four years earlier.

Most of the 1962 expansion could be attributed to rising exports from the major industrial countries—United States, western Europe, and Japan—and from Oceania. Only minor increases were shown in shipments from Asia, Africa, and the Middle East, while no change was discernible in Latin American exports. Furthermore, expanded trade between the developed areas of the world accounted for a large share of the overall rise.

A partial explanation of the lack of vitality in the exports from the less-developed countries lay in the fact that prices for many primary products in world markets declined in 1962. In fact, the movement of industrial and primary prices had been diverging for some years. Since 1958, average export prices for industrial goods had increased by 3%, while average prices of commodities exported by the less-developed areas had moved downward by 5 or 6%.

Among the industrial countries, the United States expansion in 1962, after a pause in export sales the previous year, was noteworthy. The main push for rising world exports in 1962, as in other recent years, however, came from the still expanding economies of western Europe and Japan. In the latter country, the rate of increase of production and investment was reduced, but exports were in greater demand in foreign markets than ever, and were expected to be at least 15% above the previous year's level. Exports were especially strong to the United States, as major gains were shown in sales of tuna, iron and steel products, and cotton, silk, and woolen fabrics.

Despite some slowing in the rate of growth of most European countries, their external trade continued to grow about as fast in 1962 as in the previous year. Exports from the European Economic Community (EEC, or Common Market), however, were less buoyant than those of other European countries.

The EEC initiated a further 10% cut in internal tariffs on industrial products at the beginning of the year, followed by a second 10% reduction on July 1. This brought the total reduction in internal tariffs since the establishment of the market in 1957 to 50%. The halfway mark was thereby reached 30 months ahead of the original timetable. On selected agricultural products, an additional 5% cut was made in the middle of the year, making a total cut on these items thus far of 35%. A decision was made to take a second step toward the common external tariff (CXT) on July 1, 1963, also 30 months ahead of schedule. At that time, the differences between the CXT and each country's national tariff will be narrowed by 60% on all nonagricultural goods, with minor exceptions where the CXT will become effective at once.

Agreement was reached early in 1962 on an EEC agricultural policy, designed to create, over a transitional period of 7½ years, a common market in farm products. A system of variable import levies was designed in an effort to equalize the prices of imported farm products with the domestic support prices of member countries. These levies became effective on August 1 on foreign grains, poultry, eggs, pork, fruit, and vegetables. To maintain a competitive advantage for producers in the market, certain supplemental charges could also be levied against outside imports as necessary. (See also EUROPE.)

United States.—The year 1962 was a momentous one for United States trade policy. The beginning of the year brought the successful conclusion of a two-year negotiation on tariff reductions with the Common Market and other countries under the eleventh extension of the Trade Agreements Act of 1934. The end of the year saw the passage of the new Trade Expansion Act of 1962, containing unprecedented tariff-cutting authority for the president and a unique plan of tariff adjustment assistance.

In tariff negotiations under the General Agreement on Tariffs and Trade (GATT), the United States received concessions on a trade volume of about $1.6 billion in return for commitments, to take effect in most cases in two steps, one year apart, on United States tariffs covering commodities with a trade volume of $1.2 billion. In special negotiations with the EEC, agreement was reached for a phased 20% cut in most of the industrial items making up the common external tariff. On two products of special interest to the United States—automobiles and automobile parts—duties

were cut by even larger amounts. Various arrangements, including a number of tariff cuts, also were agreed on agricultural items. New concessions were agreed on at Geneva with 18 other countries. (See also TARIFFS.)

The new Trade Expansion Act of 1962, signed by President Kennedy on October 11, authorized the president to reduce rates of duty existing on July 1, 1962, by 50% in the next five years. He was further given authority to eliminate duties (1) on categories of goods for which the United States and the Common Market together account for 80% or more of free-world exports; (2) on selected agricultural commodities where such modification would assure maintenance or expansion of United States exports of like goods; (3) on tropical agricultural or forestry products not produced in the United States if the EEC would reciprocate; and (4) on articles for which the ad valorem rate is now 5% or less. The power to eliminate duties was the first such authority granted by Congress to the president.

Automobiles, new	307	268
Chemicals and related products	390	282
All other imports for consumption	5,963	4,289

Note: Commodity exports exclude "special category" exports which are restricted for security reasons.

The other unique feature of the act was the initiation of a program of tariff adjustment assistance. Under this provision any industry, firm, or group of workers threatened with, or experiencing, serious injury from increased imports as a result of a tariff concession can apply for assistance. This may be in the form of technical assistance, loans, or tax relief for firms, or weekly unemployment allowances, retraining, or relocation allowances for workers. Negotiations under this new act were expected to begin early in 1964.

United States trade through September 1962 was rising strongly toward record totals. Nonmilitary exports for the nine months of the year, on a seasonally adjusted annual basis, were $21.2 billion, more than 5% above the calendar year 1961 level. Imports were even more buoyant, climbing by 12% in annual rate over 1961 to $16.4 billion. The 1962 balance of trade, based on nine months' data, was, therefore, about $4.8 billion, compared with $5.3 billion in the year 1961.

Strength in machinery sales abroad contributed to the high export level, with sales to western Europe, Japan, and Canada through August well above those of the previous year. Aid-financed sales of machinery to India and Pakistan also showed notable increases. Gains were concentrated in various types of industrial machinery, particularly power-generating, construction, excavation, and mining machinery, and machine tools. Shipments of foodstuffs gained over the previous year. Among the grains, wheat lagged behind 1961 totals, but coarse grain sales were exceptionally large and rice shipments rose by 50%. Sales of meat products to the EEC—mainly poultry to Germany—were especially high through July 31 when new import levies went into effect, but they receded thereafter. Cotton sales were very sluggish, totaling only 2.9 million bales in the first eight months of 1962, compared with 4.8 million bales in the like period of 1961. Iron and steel scrap exports dropped to less than half their exceptional 1961 total, while copper and copper-base alloys decreased by 25%. Sales of motor trucks also were down, but reductions in that vehicle category were more than compensated for by large gains in sales

of parts for assembly and, to a lesser extent, in new passenger car sales.

Imports, which gained steadily quarter-by-quarter from April 1961, were larger in almost every major group. Increased amounts of coffee were purchased, but because of lower prices, at a smaller value than in 1961. Meat products rose by 20% in value. Among industrial materials for which demand was strong as the economy operated in high gear, at record levels of income and investment, there were increased imports of crude petroleum, rubber, sawmill products, wood pulp, iron ore, aluminum, nickel, and tin. Declines were registered for deliveries of uranium, fuel oil, and lead. In the finished-goods categories, purchases of foreign machinery, iron and steel mill products, and textile manufactures all climbed impressively.

By area, import gains were relatively minor from Africa and Latin America, and strongest from Canada, Europe, and the Far East. Exports were substantially larger to Canada, Europe, and Africa, but smaller to Latin America and the Far East, the latter being influenced by a drop in shipments to Japan of over $200 million in the first eight months of 1962.

The Export-Import Bank of Washington implemented further its assistance to United States foreign trade in 1962 by starting three new programs. On February 5, the new Foreign Credit Insurance Association (FCIA), sponsored and underwritten by the bank, began operation. Insurance policies are issued by FCIA to cover both commercial credit and political risks on transactions resulting from United States export sales to buyers in friendly foreign countries. Insurance was initially provided for short-term credit transactions of up to 180 days, but later in the year was extended to cover medium-term transactions, for sales covering terms of 181 days to 5 years. The other two new bank programs were a system of guarantees on export transactions for commercial banks, and the sale of $300 million of Export-Import Bank portfolio paper to private United States banks.

During the fiscal year 1962, the bank authorized loans, guarantees, and export credit insurance totaling $1.8 billion, the largest annual volume of business in its history except in 1946 when huge loans were made for reconstruction in Europe.

The balance-of-payments deficit of the United States through September 1962 was estimated at $1.4 billion. About half of this total was incurred in the third quarter, with $476 million attributable to the first quarter and $218 million to the second. Totals for the second quarter were favorably, and those for the third quarter were unfavorably, affected by the Canadian financial crisis and by measures taken by that government in May and June to stop its loss of reserves.

Compared with the same period of the previous year when the deficit was $1.05 billion, the less favorable picture in 1962 stemmed primarily from a deterioration in the merchandise export surplus and some change in the outflow of United States capital. An increase in private long-term direct investment was more than counterbalanced by a sizable reduction in the outflow of private short-term investments. Advance repayments of $471 million in postwar debts by France and Italy in the third quarter contributed to the overall balance. (See also FOREIGN INVESTMENTS.)

Canada.—Canadian trade moved to new record levels in 1962, as demand for that country's crude industrial materials strengthened in the United States and import requirements rose with the expansion of industrial production and personal income. Exports through September totaled C$4,623 million, a 9% advance over the comparable period of 1961. A part of this gain reflected the change in the foreign exchange value of the Canadian dollar. On May 2 that dollar was pegged at 92½ cents in terms of United States currency, after nearly 12 years of fluctuation in response to conditions of supply and demand.

Canadian exports to the United States through September rose by nearly 20% over shipments in the corresponding period of 1961, but declined fractionally to the United Kingdom and by somewhat more to the rest of the world. Shipments to the United States were especially strong in materials for industry. Iron ore, crude petroleum, nickel, aluminum, and copper advanced sharply. Declines, however, were registered in deliveries of uranium and newsprint to the United States. The net increase raised the share of Canadian exports absorbed by the United States from 53½ to 59% of the total.

Canadian imports through August climbed by 14% over the like total for 1961, to C$4,235 million. The resultant import balance for the 8-month period was C$104 million, contrasting with a small export balance of C$21 million in the same months of 1961. Eighty-five percent of the increase in imports in 1962 arose from purchases in the

United States. Imports from Britain dropped by about 6% during the year, although those from the rest of the world expanded somewhat. Especially buoyant were imports of various types of textile fibers and textile products, industrial machinery, electrical apparatus, and aircraft.

The Canadian balance of international payments in the first half of 1962 reflected unusual developments. From the end of 1961 through June 24, 1962, there was a loss of about half of the official holdings of gold and foreign exchange, or almost C$1 billion. On June 26 the government instituted a comprehensive program to relieve pressure on the Canadian dollar and to bring about a stabilization of Canada's foreign transactions, supported by large international borrowings. The substantial net outflow of capital, especially in short-term forms, was in contrast with predominant inflows—primarily long-term—which had characterized Canadian accounts for a prolonged period.

The current account deficit also worsened in the first two quarters from the like period of 1961. Unfavorable shifts both in trade and in nonmerchandise transactions caused a deterioration of C$77 million.

By November 1, Canada's exchange reserves had been greatly strengthened, and some of the emergency measures taken in June to halt losses were modified. The interest rate, which had been raised to 6%, was cut in two steps to 5%, and surcharges on some types of industrial machinery, steel, and other products, amounting to imports of C$250 million, were removed. Other surcharges of from 5 to 15%, which had been levied on about half of Canada's imports, remained.

Latin America.—The international trade of the Latin American republics deteriorated through the first half of 1962. Exports of these countries as a group continued at their static level of the last several years, while imports were lower than in any year since 1959. The depressed export level was due primarily to reduced prices for many major Latin American exports. Coffee, sugar, cocoa, tin, copper, and cotton all were selling below the levels of the previous year. The downward price trends reflected the fact that demand for these products had risen far more slowly than supply. The expansion of supply had been encouraged by improved production techniques, increased mechanization, and new mineral finds.

Among the major republics, exports from Brazil were the most depressed in 1962, dropping in value by 25% in the first nine months. Argentina and Venezuela, on the other hand, were notable by registering sizable export gains in this period. The imports of almost every republic, except Peru and Uruguay, either showed no change or, as in the case of Argentina, Brazil, Colombia, and Mexico, dropped considerably below the values of the previous year.

Regional efforts to deal with the sluggish trade situation, which in turn bears on the area's economic development, were primarily of two types: establishment of broader regional markets and the encouragement of international commodity agreements. The Central American Common Market was expanded to five countries in the summer of 1962, when Costa Rica added her signature to the General Treaty for Central American Economic Integration. In an effort to provide a broader base for economic expansion, these countries have moved a considerable distance toward setting up a common market. Eighty percent of all commodities are now imported under a common external tariff, and barriers have been eliminated on about half of the trade among the member countries.

The larger Latin American Free Trade Association, comprising Mexico and eight South American countries, met for its second annual trade conference in Mexico City in August 1962, where further tariff reductions were programmed. Concessions had been granted in the first year of operation on more than 1,000 products.

Following a United Nations conference during the summer months, a five-year international coffee agreement was drawn up, the first of its kind to which both producing and consuming countries have subscribed. The agreement established basic first-year export quotas at 1% less than in the previous year, and provided for a study of obstacles to increasing consumption. The successful completion of this cooperative agreement encouraged demands by Latin American countries for a consideration of others.

Table 5—TRADE OF PRINCIPAL LATIN AMERICAN REPUBLICS, 1961–62

United Kingdom.—Following a decline in the latter part of 1961, British exports through September 1962 shifted to a firmly rising trend. This change resulted from a recovery in exports to the sterling area, which had fallen at the end of the previous year, and a continued growth in shipments to western Europe.

Imports, which had dropped considerably in 1961, expanded by about 1% through September 1962, with larger amounts of foodstuffs and fuels accounting for most of the increase. The deficit in the balance of trade for the first nine months was £425 million, only slightly less than in the comparable months of the previous year.

The United Kingdom balance of payments for the first half of 1962 continued to improve, as it had in the previous half-year, following adverse movements in the two preceding years. The first half-yearly surplus since 1959, totaling £96 million, was recorded in the current account. The trade deficit (for payments purposes, based on an f.o.b. calculation of imports) was only £16 million, compared with £115 million in the same period of 1961. The downturn in net earnings from "invisibles" was reversed, as the surplus of £112 million was double that for the first half of 1961. Increased interest, profit, and dividends accounted for much of this gain. A net outflow was recorded for long-term capital movements; thus, the current and capital accounts together showed a surplus of £55 million for the first six months of 1962.

United Kingdom exports of manufactured goods, accounting for roughly 85% of total exports, rose very little as a group in the first nine months of 1962, but there were a few significant shifts. Greater sales were registered for road motor vehicles, chemicals, and nonelectrical machinery, and lower sales for ships, iron and steel, and cotton yarns and fabrics. Mineral fuel exports climbed by almost 20% in the period, and basic materials—primarily metal ores and scrap to Germany, Japan, and others—rose by about 10%. There were likewise few major changes in imports in 1962. Increases in food imports reflected continued high consumer demand. These were almost balanced in value by declines in basic raw materials, as inventories were reduced. A net 8½% gain in petroleum purchases was accompanied by a shift in suppliers.

FRANCES L. HALL,
Deputy Director, International Trade Analysis Division, Bureau of International Commerce, U.S. Department of Commerce.

INTERSTATE COMMERCE COMMISSION

This independent federal agency was created by Congress in 1887 to regulate railroad transportation. Subsequent amendments to the Interstate Commerce Act broadened the commission's jurisdiction to include interstate trucks and buses, barges, coastal and intercoastal shipping, freight forwarders, oil pipelines, express companies, and transportation brokers.

The 11 members of the commission are appointed by the president, subject to Senate approval, for seven-year terms or to fill unexpired terms. Commissioner Rupert L. Murphy was elected chairman for 1962, and Commissioner Laurence K. Walrath, vice chairman. The commission in 1962 was composed of six Democrats and five Republicans.

The authority of the Interstate Commerce Commission (ICC) generally embraces carrier rates and charges; issuance of securities; financial reorganization of railroads; mergers of carriers; approval of government guaranty of commercial loans to railroads; construction or abandonment of lines of railroad; discontinuance of passenger train service; approval of new operating services of carriers; rail and motor carrier safety; and land transportation of explosives.

Increased use of such innovations as piggyback (truck trailer-on-flatcar service), containerized shipping, and new types of rate structures increased an already record workload for the commission. As a result of a reorganization in 1961, however, formal cases were processed 11% faster. Changes included strengthening the chairmanship, creating the post of vice chairman, assigning opinion-writing responsibilities to individual commissioners, reducing commission divisions from four to three, and limiting the right of appeal before the entire commission.

ICC-regulated common carriers in 1962 again lost traffic and revenue to private and unregulated carriers. If the trend continues, it is estimated that by 1970 common carriers will handle only 60–64% of the total intercity traffic. The commission's recommendations to Congress included requests for restriction of exemptions for unregulated freight transportation. Earlier recommendations, for repeal of the 10% federal tax on passenger fares, and faster depreciation of transport equipment for tax purposes, were approved.

During the 1962 fiscal year, ending June 30, 1962, the carriers subject to ICC jurisdiction recorded $20.3 billion in operating revenues, compared with $18.8 billion for the previous year. The railroad portion of total intercity freight carried in 1961 was 43.2%, compared with 43.7% for the previous year. The volume of piggyback, however, expanded, and the number of flatcars assigned to piggyback operations was over 17% greater as of June 30, 1962, than a year earlier. Intercity traffic by truck increased in 1961 from 22.4% to 23.1% of the intercity total. The deficit incurred by railroads from passenger operations was $408.2 million, compared with $485.2 million for the previous year. Private automobiles accounted for some 90% of the total intercity passenger miles.

Rail carriers had operating revenues of $9,837,382,000; motor carriers of property, $8,228,512,000; motor carriers of passengers, $713,679,000; water carriers, $401,271,000; and oil pipelines, $802,449,000.

IOWA

A Central state of the United States, Iowa ranks 25th among the states in area (land, 56,032 square miles; inland water, 258) and 24th in population (2,777,000 on July 1, 1962, an 0.7% increase from the 1960 census figure of 2,757,537). Urban places with populations above 20,000 in 1960:

Ames	27,003	Fort Dodge	28,399
Burlington	32,430	Iowa City	33,443
Cedar Falls	21,195	Marshalltown	22,521
Cedar Rapids	92,035	Mason City	30,642
Clinton	33,589	Muscatine	20,997
Council Bluffs	55,641	Ottumwa	33,871
Davenport	88,981	Sioux City	89,159
Des Moines (*capital*)	208,982	Waterloo	71,755
Dubuque	56,606		

Government.—Chief executive and judicial officers in 1962 included Norman A. Erbe (Republican), governor, serving a two-year term; William L. Mooty, lieutenant governor; Melvin D. Synhorst, secretary of state; M. L. Abrahamson, treasurer; Chet B. Akers, auditor; Evan L. Hultman, attorney general; Paul F. Johnston, superintendent of public instruction; and Theodore G. Garfield, chief justice of the 9-member Supreme Court.

The Iowa General Assembly, which convenes in odd-numbered years, comprised 35 Republicans and 15 Democrats in the Senate in 1962 and 78 Republicans and 30 Democrats in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $555,364,581 included $292,492,832 from state taxes and $108,371,995 in federal funds. Chief tax yields were the 2% general sales tax ($69,937,061), taxes on individual income ($41,015,909) and motor fuels ($73,143,535), and licensing ($54,818,949). Spending of $548,514,855 included $94,801,637 for education, $96,565,033 for health, welfare, and safety, and $150,443,953 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 15,925 teachers enrolled 398,500 students; secondary schools with 11,900 teachers enrolled 212,500; and parochial schools with 3,111 teachers enrolled 90,424. Colleges and universities enrolled 61,154.

Estimated public school spending in the 1961–62 school year totaled $270.8 million, including current expenditures of $222.5 million ($405 per pupil) and capital outlay of $40 million. Revenue of $276.9 million was drawn chiefly from state funds ($30 million) and local districts ($191 million). Teachers' salaries averaged $4,922 (high school, $5,572; elementary, $4,490). Actual spending for higher education (1961 fiscal year) totaled $69,541,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 70,300 persons totaled $52,093,705. This amount included $36,082,610 for the aged and $13,912,157 for dependent children.

Transportation and Communications.—With 2,821 miles of highway construction and reconstruction completed in 1961, *highways and roads* as of Jan. 1, 1962, totaled 111,612 miles (101,421 surfaced). These served 1,476,317 *motor vehicles* (as registered during 1961), including 1,086,165 automobiles. Operating in the state were (1960) 24 *railroads* (using, 1960, 9,473 line miles of track); (1962) 4 regularly scheduled *airlines;* and 92 municipal *airports.*

Communications media included (1962) 82 AM and 14 FM *radio stations;* 13 *television stations;* 46 daily *newspapers* (1961 circulation, 947,674) and 386 other newspapers; and (Jan. 1, 1962) 248,000 business and 992,700 residential *telephones.*

Labor Force.—The state's work force in July 1962 included 325,900 agricultural workers. Nonagricultural employment totaled 848,800, compared with 829,400 a year earlier and an average of 839,100 for the 12 intervening months. Of wage and salary workers (except domestics), 25% were in manufacturing, 25% in trade, and 17% in government services. Unemployment in July 1962 stood at 31,300, compared with 40,300 a year earlier.

Manufacturing.—The state Development Commission estimated that manufacturing engaged an average of 170,700 workers in 1961 and provided

LEADING IOWA MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Totals	176,115	$922,829	$1,826,337
Food and kindred products	53,470	289,068	581,426
Nonelectrical machinery	32,291	185,832	286,909
Electrical machinery	18,622	97,150	217,159
Chemicals and products	4,846	26,111	107,152
Fabricated metals	9,101	47,381	85,616

[1] For definition, see footnote 1 in the article *Industrial Production.*
(Source: *1960 Annual Survey of Manufactures.*)

a payroll of $828 million. Value added by manufacture was estimated at $1,870 million.

Mining.—Iowa ranked 30th among the states in the value of its mineral output in 1961, with 0.50% of the national total. Output was about the same as in 1960, but the value declined because of very active competition. Iowa ranked third in production of gypsum. Accounting for more than three fourths of the total value of $90,764,000 were portland cement ($41,718,000) and stone ($28,916,000).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $1,852,419,000, compared with $1,766,804,000 in the corresponding period of 1961. For the full year 1961, income comprised $1,957,433,000 from livestock, $584,408,000 from crops, and $129,568,000 in government payments. Principal income sources in 1961 were cattle, $856,320,000; hogs, $733,258,000; corn, $317,898,000; and soybeans, $209,486,000.

The state's 175,000 farms in 1959 had an acreage of 33,831,000 (22,873,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 6,654,000 cattle, 12,930,000 hogs, 1,583,000 sheep, and 24,331,000 chickens. An average of 252,000 family and 37,000 hired workers engaged in farming during 1961.

IOWA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	193	350	260
Corn for grain (1,000 bu.)	601,420	753,188	742,976
Hay (1,000 tons)	7,330	7,537	8,295
Oats (1,000 bu.)	198,565	140,896	129,516
Soybeans (1,000 bu.)	54,347	97,042	91,935
Wheat (1,000 bu.)	3,201	3,224	2,223

(Source: U.S. Department of Agriculture.)

Events, 1962.—In the primary elections held in June, Republican Gov. Norman A. Erbe defeated State Highway Commissioner William Nicholas, and Harold E. Hughes, Democratic member of the Iowa Commerce Commission, easily won nomination over the Rev. Lewis E. Lint, former secretary of the Iowa Tax Commission. In the November general election, in a vote that saw less than 50% of the eligible voters participate (the lightest vote since 1946), Hughes defeated Governor Erbe, 430,330 to 390,262. Iowa's senior U.S. Sen. Bourke B. Hickenlooper won his fourth consecutive six-year term by defeating Democrat Elbert B. Smith, 432,220 to 375,916.

Republican candidates retained all other state house elective posts, including Lt. Gov. William L. Mooty, Secretary of State Melvin D. Synhorst, Treasurer M. L. Abrahamson, Auditor Chet B. Akers, Secretary of Agriculture L. D. Liddy, and Attorney General Evan L. Hultman. The Republicans also won six of the seven seats in the U.S. House of Representatives, with only Neal Smith, incumbent in the 5th District, winning for the Democrats. Large Republican majorities were returned in both the state Senate and the state House of Representatives. The line-up for the 1963 General Assembly is 79 Republicans and 29 Democrats in the House, and 38 Republicans and 12 Democrats in the Senate (a Republican gain of 1 seat in the House and 3 in the Senate).

Iowa voters approved a constitutional amendment which reforms the method of selecting state judges. As of January 1963, Supreme Court and District Court judges will be appointed by the governor from a list drawn up by special judicial commissions composed of members of the bar and lay citizens. At the end of their terms, judges will run unopposed on a nonpartisan ballot; a judge failing to receive a majority of the vote will be replaced by an appointee.

On August 10, more than 25,000 Iowans witnessed the opening of the Herbert Hoover Library-Museum, at West Branch, the former president's hometown. The ceremony was attended by Mr. Hoover and former President Harry Truman. A 50-mile segment of a new highway (part of Interstate 80), extending from near West Branch to Davenport, was completed in 1962.

The Iowa corn crop in 1962 hit an all-time high as to the number of bushels produced per acre. The average yield was 76 bushels per acre, but the total of 744 million bushels fell short of the state's production record due to the reduced number of acres planted to corn.

State revenue increased by nearly 10% over that of 1961, with no change in the tax structure or tax rate. Property taxes continued to rise even more rapidly than the general state taxes. The state comptroller estimated that the treasury surplus at the end of the 1962–63 biennium would total between $20 and $22 million, thus keeping Iowa one of the few states free of indebtedness.

Unemployment in the state averaged less than half that of the national average in 1962. The number of persons employed in agriculture continued to decline, but this was offset by increased job opportunities in manufacturing. While the number of farms continued to decrease, the average size of farms showed a further increase, reaching approximately 190 acres per farm.

"Events" by: RUSSELL M. ROSS,
Executive Assistant to the Governor of Iowa.

IRAN

Known also as Persia, Iran is a constitutional monarchy in southwestern Asia bordering on the Soviet Union, Afghanistan, Pakistan, Iraq, and Turkey. Its area is estimated at 628,000 square miles, and its population (July 1, 1961) at 20,678,000. Principal cities and populations (1956 census): Teheran (Tehran), the capital, 1,512,082; Tabriz, 289,996; Isfahan, 254,708; Meshed, 241,989; Abadan, 226,083; Shiraz, 170,659; Kermanshah, 125,439; Ahwaz, 120,098; Resht, 109,491; and Hamadan, 99,909. About 30% of the population live in urban areas; some 13 million farmers live in 45,000 small villages. Less than 2 million nomadic and seminomadic tribesmen, including Kurds, Lurs, Bakhtiaris, Qashqais, Turkomans, Baluchi, Mamassani, Arabs, and Shahsavan, move seasonally between the hot lowlands and the cool valleys of the mountain ranges. Persian is the official language.

Government.—Executive power rests with the shah (Mohammed Riza Pahlavi: b. 1919; acceded Sept. 16, 1941), assisted by a prime minister (Assadullah Alam succeeded Ali Amini, who resigned on July 17, 1962) and a cabinet responsible to the Parliament. The lower house, or Majlis, consists of 200 deputies, elected every four years; the 20th Majlis opened on Feb. 21, 1961. The Senate, consisting of 60 members (30 appointed by the shah and 30 elected in two stages), serves for six years. On May 9, 1961, Parliament was dissolved by the shah, and the prime minister was given temporary power to rule by decree

WIDE WORLD

(*Above*) Iranian father in Dar Esfahan holds his son and weeps for his wife and four other sons, killed in devastating earthquakes on September 1–2. (*Right*) In Kiavan, on September 3, woman sifts the rubble for her belongings.

pending the holding of new elections. The major political organizations are the pro-government Nationalist (Mellioun) and People's (Mardom) parties; and the anti-government National Front, representing the urban centers, and the proscribed Communist (Tudeh) Party.

Education and Religion.—Primary education is free and compulsory; about 22% of the school-age population is in school. Number of schools (with enrollments), 1960: 9,289 primary (1,327,376); 1,163 secondary (252,746); 100 technical (8,997 in 1959); and 55 teacher-training (4,214 in 1959). The universities of Teheran, Tabriz, Meshed, Shiraz, Isfahan, and Ahwaz have about 20,000 students. Principal religion: Islam (Ithna 'Ashariyah Shi'ite sect); about 5% of the population are Sunni Muslims.

Defense.—Military service is compulsory. The Iranian armed forces total about 200,000 men. Since 1942, United States military missions have advised on the organization, training, and administration of the armed forces of Iran, including the gendarmerie; and since 1950 the United States has helped to provide the equipment of these forces. On July 1, 1962, the United States ended its $30 million annual subsidy for the maintenance of the Iranian Army. In March 1959, Iran and the United States concluded a bilateral agreement providing for the defense of Iran against aggression. Iran is a member of the Central Treaty Organization (CENTO).

Finance.—The total budget, including ordinary and special budgets, the Plan Organization, and the National Iranian Oil Company, for the calendar year 1341 (March 21, 1962–March 20, 1963) estimated revenue at 87.8 billion rials, and expenditure at 89.6 billion (at the official rate, 75.75 rials equal U.S.$1). In 1961, Iran's external debt approached $570 million ($559 million in 1961). In July 1962, gold and foreign holdings totaled $266 million ($242 in 1961).

Transportation and Communications.—Transport networks (miles): roads, 16,700, including all-weather, 10,700, and paved, 2,000; railroads, 2,370. Principal airport: Mehrabad at Teheran, served by the Iranian National Airlines and 20 foreign airlines. Other airports of entry: Abadan, Tabriz, Meshed, Isfahan, Shiraz, Ahwaz, Kermanshah, and Zahidan. Abadan is the principal port for petroleum exports; Khorramshahr is the chief port for other products (see also below, *Events, 1962*). Other communications data (1961): telephones, 90,000; radios, 900,000; television sets, 38,000; motor vehicles, 130,000.

Economic Development.—Iran's third development plan, prepared by the Plan Organization, was initiated on Sept. 23, 1962, and is to run until March 1968. Of the total planned outlay of 140 billion rials ($1,870 million), 100 billion rials will be derived from Iranian government allocations and 40 billion rials from anticipated foreign and domestic loans. Emphasis of the third plan will be on irrigation, schools, health centers, and roads to link isolated villages to highways, in addition to increasing Iran's production income by 6.5% annually (see also below, *Events, 1962.*)

Agriculture.—The economy is primarily agrarian; agriculture accounts for about 40 to 50% of Iran's $3 billion gross national product. Chief crops (metric tons, September 1960 census): wheat, 2,589,838; barley, 683,743; rice, 651,082; cotton, 236,540; sugar beets, 468,479; melons, squash, and cucumbers, 351,923; other vegetables, 209,366; alfalfa and sainfoin, 209,341; tobacco, 12,115. About 15 million acres are under cultivation, about one third of which are irrigated. Sheep (15,957,000 in 1960) and goats (12,080,000) graze on 50 million acres of range land.

Minerals.—Petroleum accounts for 15% of Iran's gross national product. In 1961, oil revenue totaled $291 million ($286 million in 1960). In 1962 average quarterly production of crude oil amounted to 15.4 million metric tons (14.5 million in 1961). Major oilfields: Mashid-i-Sulaiman, Haft Kel, Gach Saran, Naft-i-Safid, Naft-i-Shah, Agha Jari, Lali Ahwaz, and Alborz (Qum). Major terminals: Abadan, Kharg Island, and Bandur Mashur. Major refineries (barrels, 1960): Abadan, 119.5 million (109.1 million in 1959); Kermanshah, 919,000 (754,000); and Naft-i-Shah, 200,000 (556,000).

Iran's oil resources are controlled by the National Iranian Oil Company (NIOC). Under the terms of the agreement of Oct. 29, 1954, the management of existing fields and exploration of new fields was turned over to the Iranian Oil Exploration and Refining Company and the Iranian Oil Refining Company, both owned by a consortium of international oil companies. The Société Irano-Italienne des Petroles (SIRIP) and the Iran Pan American Oil Company (IPAC) also are actively engaged in petroleum exploration.

Other mineral production (metric tons, 1960): coal, 233,000; chromite, 55,000; iron ore, 60,000; lead ore, 87,000; rock salt, 80,000; sulfur ore, 10,000; zinc ore, 15,000; copper ore, 5,000. Production of natural gas in 1960 amounted to 266,454.2 million cubic feet.

Manufactures.—Chief industrial products (metric tons, 1960–61): cement, 800,000; sugar, 159,100; cotton piece goods, 206.5 million meters; cigarettes, 8.4 million; rubber footwear, 8.2 million pairs (in 1959). Of the total number of industrial units (4,430 in March 1960), 2,133 were located in Teheran; 3,133 employed 10 or fewer workers; and 4,355 were privately owned.

Foreign Trade.—Total exports, 1960–61 (Iranian year 1339): 61,750 million rials (8,359 million excluding petroleum); imports, 52,657 million. Principal exports other than petroleum products: raw cotton, dried fruits and nuts, carpets, wool, seeds and gums, rice, and animal casings. Chief imports: sugar, tea, machinery, motor vehicles, tires and tubes, iron and steel products, chemicals and pharmaceuticals. Major trading partners: West Germany, the United States, Great Britain, the USSR, India, Japan, and France.

Events, 1962. *Internal Affairs.*—Early in the year, demonstrations in Teheran by secondary school students protesting more stringent scholastic requirements spread to Teheran University; and in clashes on January 23 with security forces, a student was killed. The National Front, a coalition of elements opposed to the policies of the regime, called for a protest strike, but the call went unheeded. The government arrested both rightist and National Front leaders and stated that public order would be strictly enforced. On January 25, Iran accused the USSR of inciting the student demonstrations and interfering in its internal affairs. Teheran University was closed on February 4 and not reopened until early in April.

On January 9 the cabinet issued a land-reform law by decree in the absence of the Parliament which had been dissolved in June 1961. The decree stated that all landowners must sell their holdings in excess of one village to the government, which, in turn, would sell these lands to landless peasants. In March the shah presided over the initial distribution of such lands to farmers in the northwestern province of Azerbaijan, and the program of distribution spread to other areas in the following months.

Throughout the spring Prime Minister Ali Amini pushed forward with his anticorruption program, bringing ranking military officers and civilian officials to trial. At the same time great

emphasis was placed on an effort to achieve financial stability. By June it had become certain that the United States would not provide the funds to close a $70 million budget deficit. On July 17, Prime Minister Amini, unable to obtain full cooperation from his cabinet in trimming expenditures and physically exhausted by his efforts, resigned. He asserted that "tardy economic aid" and the cutting off of military assistance by the United States caused his government to fall. The U.S. State Department denied the prime minister's assertion, pointing out that it had given Iran $67 million in loans and grants and had committed $20 million more in development loans during Amini's 14 months in office. To succeed him the shah named Assadollah Alam, a personal friend and former head of the People's (Mardom) Party. Alam pledged himself to continue the reform program of the previous government, and stressed that he would initiate a decentralization of the government's authority by conferring wide powers on the provincial governors. On August 25, U.S. Vice President Lyndon Johnson arrived in Teheran and took advantage of the occasion to assure the shah and the prime minister of continuing American interest in and support for Iran.

On September 1 a major earthquake shook a 23,000-square-mile area some 75 miles to the west of Teheran; an estimated 12,400 persons were killed and scores of thousands were injured and made homeless. Iran's emergency facilities were augmented by generous contributions from many countries.

In February–March, Prime Minister Amini visited Bonn, Paris, Brussels, and London in an effort to line up financial support for an international consortium to lend $500 million to $800 million for Iran's third development plan. The consortium, under the auspices of the International Bank for Reconstruction and Development, failed to materialize during 1962 because of the inability of the Iranian government to halt its budgetary deficits. On September 13 it was announced that the third development plan's total anticipated expenditures would be cut from $2.5 billion to $1.86 billion. In addition, the Plan Organization, the body that designs and approves projects, will no longer execute the development plan. This aspect will be turned over to the regular government ministries. The prime minister and cabinet also assumed final authority for approval of all projects.

On September 16, Iran renewed its contract with the Development and Resources Corporation (New York) for the completion of the $140 million Dez River development project in Khuzistan. On May 13 the shah opened the 352-foot-high Manjil Dam on the Sefid Rud River. The $112 million dam, built by French engineers, will provide 132,000 kw. of electric power and sufficient water to irrigate 375,000 acres in the province of Gilan.

External Affairs.—On April 11 the shah, together with Empress Farah, arrived in Washington, where he engaged in talks with President Kennedy and other high officials. Agreement was reached between the two countries for the development of a new port at Bandar Abbas and the construction of a transport network to open for development southern Iran's mineral resources. It would also provide landlocked Afghanistan with a new outlet to the sea. On July 26 the shah went to Afghanistan and Pakistan, on the invitation of the heads of those states, in an effort to mediate the differences which had led to a break in their diplomatic relations the previous year (see also AFGHANISTAN).

Although a $5.5 million trade pact between the USSR and Iran was renewed in June, the Soviet Union continued to attack the shah and his government by press and radio. These attacks ceased on September 15 with the announcement that Iran had pledged to the USSR that no foreign rocket bases would be established on its soil.

DONALD N. WILBER,
Author of "Iran Past and Present."

IRAQ

The Republic of Iraq is situated in southwestern Asia at the head of the Persian Gulf, and is bounded on the north by Turkey, on the west by Syria and Jordan, on the east by Iran, and on the south by Saudi Arabia and Kuwait. It has an area of 171,599 square miles (more than 45% desert), and a population of 7,085,000 (June 30, 1960 est.), composed principally of Arabs (75%), Kurds (15%), Iranians, and Turkomans. Chief cities and populations (1960 est.): Baghdad, the capital, 830,000; Basra, the main port, 165,000; Mosul, 180,000; and Kirkuk, 150,000. The official language is Arabic.

Government.—Iraq was governed in 1962 under the provisional constitution of 1958 which declared the country to be an independent, sovereign, and Islamic republic and an integral part of the Arab nation. A three-member Council of Sovereignty (Muhammad Najib al-Rubei, president) acted as the titular head of state. All legislative and executive power was vested in the Council of Ministers, headed by Gen. Abdul Karim al-Kassem. Political parties resumed limited activities in 1960; but by the end of 1962, parliamentary elections had not been held.

(The government was overthrown by a junta of young army officers who seized Baghdad in a coup d'état on Feb. 8, 1963. On the following day Premier Kassem was executed by a firing squad.)

Education and Religion.—Number of schools (with enrollments), 1959–60: 99 nurseries and kindergartens (9,594); 3,228 primary (642,665); 362 secondary (120,155); 38 technical (7,382); 65 teacher-training (11,050); and 5 institutions of higher education (12,115). Principal religions: Shi'ite Islam (a slight majority) and Sunnite Islam. There are also about 150,000 Christians and a few Jews.

Finance.—Government revenue (1962–63 fiscal year est.): 118.5 million Iraqi dinars (112 million in 1961–62); expenditures, 127 million dinars (120.7 million). These figures do not include the share of oil revenues allocated to economic development (an estimated 54 million dinars in 1962–63). The Iraqi dinar (ID) remained stable throughout 1962 at a par value of £1 or U.S.$2.80. Monetary supply (March 31, 1962): ID109.4 million, of which ID74.6 million was currency. Gold and foreign exchange holdings of the Central Bank: $272.8 million as of March 31, 1962 (down $30 million from a year earlier).

Transportation and Communications.—Transport networks: state-owned railways, 1,250 miles; roads suitable for vehicular traffic, 6,800 miles (about 1,900 hard-surfaced). Other data for 1960: passenger cars, 39,200; commercial vehicles, 20,000; telephones, 54,250 (1961); radio receivers, 100,000 (1959); television sets, 35,000.

Economic Indicators.—National income: ID422.1 million in 1960 (up 13.1% from 1959). Wholesale price index (1958 = 100): 112 at the end of March 1962 (unchanged from March 1961). Consumer price index (1958 = 100): 104 at the end of March 1962 (103 in March 1961).

Agriculture.—About 70% of the population is engaged in agriculture, which provides nearly one fourth of the gross national product. Chief crops (in metric tons, 1961–62 crop year estimates): barley, 900,000 (804,000 in 1960–61); wheat, 851,000 (592,000); rice, 115,000 (118,000); lint cotton, 9,000 (8,000); cottonseed, 9,000 (16,000); sesame, 5,700 (6,600). The annual date crop averages about 350,000 metric tons. In 1961 there were 9,450,000 head of sheep; wool production totaled 70,000 quintals.

Mineral Production and Manufactures.—The petroleum industry provides nearly 30% of the gross national product. Crude petroleum production in 1961 totaled 49,021,842 metric tons (47,482,948 in 1960). Chief industrial products (metric tons, 1960): gasoline, 286,000; kerosene, 307,000; distillate fuel oils, 420,000; residual fuel oils, 1,044,000; cement, 487,000; cotton yarn, 2,700 (1959); beer, 43,800 hectoliters; electrical energy, 852,000 kw.-hr.

Foreign Trade.—Total exports, 1961: ID236.3 million (ID233.6 million in 1960); imports, ID145.6 million (ID139.5 million in 1960). Principal exports (in million dinars, 1961): crude petroleum, 223.1; dates, 2.8; barley, 0.8; cement; and hides and skins. Principal imports: textiles, clothing, motor vehicles, industrial machinery, iron

and steel goods, tea, sugar, and cereal grains. Principal customers in 1961 (excluding crude petroleum exports): Lebanon, India, Soviet Union, United States, Saudi Arabia, Syria. Principal suppliers (with value of imports in millions of dinars): Great Britain (32), United States (15), West Germany (13). Imports from the Soviet bloc were valued at ID14.6 million (up ID1.1 million over 1960).

Events, 1962.—After four successive years of unfavorable agricultural conditions and partial crop failures, Iraq harvested good though not bumper crops in the 1961–62 crop year. Barley exports were increased, and the need to import other foodstuffs was reduced. Political uncertainty and intensified Kurdish unrest in the north tended to restrict economic activity, but work moved ahead during 1962 on the five-year development plan announced in October 1961 to strengthen the country's agriculture, industry, and communications. Total cost of the program was estimated at $1,586 million of which $884 million was expected to come from oil revenues, $182 million from a Soviet loan, and $33 million from a Czech loan.

Plans were laid and surveys commenced for a new 100-mile railroad to link Sulaimaniya with Kirkuk. The project is to cost $56 million and is scheduled for completion in 1963. Work on the transformation of the Baghdad-Basra railway from narrow to standard gauge was pushed forward, and plans were made for the extension of the line southward to the new deep-water port being constructed at Um Qasr on the Persian Gulf. Plans for establishing a national merchant marine were implemented on July 8 when *The Fourteenth of July*, an 8,200-ton freighter built in Japan, began to load cargo at Basra for destinations on the Persian Gulf.

During 1962 many foreign firms and agencies doing business in Iraq were in the process of reorganization to comply with nationalization legislation requiring majority ownership by Iraqi citizens. The licensing system introduced in 1961 to curb imports was continued, but tariffs, rather than quotas, were used increasingly to regulate foreign trade and stimulate local industry.

The Iraq government had announced (Dec. 12, 1961) that the concession areas of the foreign-owned (British, American, French, and Dutch) Iraq Petroleum Company and its affiliates, covering most of the country, were being restricted to the approximately 750 square miles where oil was actually being produced by the company. On Jan. 4, 1962, the Iraq Petroleum Company formally protested this action and asked for arbitration. This request went unanswered. On March 12 the company complied with the law and turned over to the government its records and surveys dealing with the lapsed concession areas.

Under these circumstances, Iraq did not immediately press its earlier demands for oil royalties in excess of the current 50% of profits or for ownership of 20% of the company's capital stock. Petroleum production continued at the company's existing wells at Kirkuk, Bai Hassan, Jambour, Ain Zala, and Batma in the north, and at Rumaila and Zubair in the south. On March 31 the Iraq Petroleum Company paid ID21.5 million to the government on account of royalties for the first quarter of 1962.

Premier Abdul Karim al-Kassem announced on September 29 that a state-owned Iraq National Oil Company would be established with a capitalization of $56 million to operate at all levels of the petroleum industry, and to exploit oil in all areas outside the reduced concession of the Iraq Petroleum Company.

On March 24, Premier Kassem revealed that a committee would shortly be established to prepare a draft permanent constitution which would be submitted either to a plebiscite or to a popularly elected national assembly for ratification. Constitutional development, however, was again delayed by civil strife.

The Kurdish revolt in the north, led by Mullah Mustafa Barzani, which had appeared to be crushed at the end of 1961, assumed larger and more threatening proportions in the spring of 1962. Guerrilla activities and military countermeasures continued throughout the year. Foreign news correspondents reported in August and September that most of northeastern Iraq, outside of the cities and towns, was under rebel control. The rebel leaders demanded the greater degree of Kurdish cultural and political autonomy which had been promised under the provisional constitution of 1958, a larger share of economic development expenditures in the Kurdish areas, and an end to the "incompetent dictatorship" of Premier Kassem.

Throughout 1962 the Iraq government reiterated its claims to sovereignty over the neighboring state of Kuwait and, in fulfillment of its threat to reconsider its relations with any government that gave diplomatic recognition to Kuwait, recalled its ambassadors from Jordan (January 18), Japan (March 17), Iran (March 18), Lebanon (May 10), the United States (June 2), and Tunisia (August 8). In each case Iraq requested the recall of the foreign ambassador in Baghdad but did not sever diplomatic relations. The Iraqi government also continued to boycott the sessions of the Council of the Arab League, as it had since July 1961 when the league accepted Kuwait into membership.

Relations with Turkey were strained in the late summer as a result of Iraqi military activities in connection with the Kurdish revolt. Iraqi airplanes on August 15 attacked the Turkish border post of Rubaruk and the village of Biskan. On August 16, Turkish aircraft shot down one of two Iraqi jet planes which, the Turkish government claimed, were over Turkish territory. The disabled plane crashed inside the Iraqi frontier. Iraq apologized for the attacks of August 15 but charged that Turkish aircraft had violated Iraqi air space 15 times since 1959, and that the Iraqi plane had been shot down over Iraqi territory on August 16. In consequence of an increasingly bitter dispute, Turkey recalled its ambassador from Baghdad.

Only with Syria, among Iraq's neighbors, were relations markedly improved during 1962. On January 21, Hashim Jawad, the Iraqi foreign minister, went to Damascus with a large delegation to explore areas of cooperation between the two countries. On March 14–16, Premier Kassem met with Syrian President Nazem el-Kodsi at Rutba, near the Syrian border. The joint communiqué issued after this meeting suggested the assembling of a conference of all Arab states within three months to create new organs of Arab military and economic cooperation. This statement, despite Syrian and Iraqi assurances to the contrary, was widely regarded as directed against the Arab League. On June 18, Syria and Iraq signed a supplement to their agreement of Nov. 3, 1961, on economic cooperation.

IRELAND

Ireland lies to the west of England, separated from it by St. George's Channel and the Irish Sea. The Republic of Ireland (Eire), a sovereign, in-

dependent state since April 18, 1949, exercises jurisdiction in 26 counties (area, 27,136 square miles); six other counties north of a border fixed in 1925 constitute Northern Ireland (q.v.). The population (2,898,264 in 1956) had fallen to 2,814,703 at the 1961 census, emigration having averaged 43,118 persons annually in the intercensal period. Dublin (pop., 716,156 in 1961) is the capital, largest city, and principal port.

Government.—The National Parliament (Oireachtas) consists of a president (Eamon de Valera, elected June 17, 1959); a 60-member senate (Seanad Eireann); and a 144-member house of representatives (Dail Eireann), constituted in 1961 as follows: Fianna Fail, 70 members; Fine Gael, 47; Labour, 16; Independent, 6; other parties, 5. The country is governed by a cabinet, headed by a prime minister (Sean F. Lemass since June 23, 1959), subject to the confidence of the Dail.

Education and Religion.—Number of schools (with enrollments), 1960: national elementary, 4,882 (506,208); recognized secondary, 526 (76,843); vocational, 718 (94,162). University facilities: Trinity College, Dublin (enrollment, 1960: 2,748); National University, comprising University Colleges in Dublin, Cork, and Galway, and St. Patrick's College, Maynooth (aggregate enrollment, 1959–60: 7,805; Dublin college had 5,311 students in 1961). Educational expenditure, 1960: £17,514,000. Roman Catholics numbered 2,786,033 (1946 census); other denominations, 169,074.

Finance.—The Irish pound is on par value with the pound sterling. Revenue receipts, fiscal 1961–62 (in thousands): £145,288 (customs, £42,115; income taxes, £32,200; excise, £31,505); exchequer expenditure, £161,720 (agricultural, £27,628; social welfare, £26,379; debt service, £30,622).

Transportation and Communications.—Main roads, 1960: 9,857 miles; country roads, 40,489 miles. State railways, 1960: 2,458 miles; passengers, 11,053,487; freight carried, 2,510,382 tons. Passengers on Aer Lingus European and domestic routes, 1961–62: 778,522 (up 9% from 1960–61); on Irish International Airlines (transatlantic, 1961–62): 55,077 (up 57%). Cork Airport (opened Oct. 16, 1961) handled 38,000 passengers and 105,000 kilograms of freight in its first eight months of operation. Tourist receipts: £47 million (up 11% from 1960). Automobiles, 1960: 169,681. Telephones, 1960: 160,354; radio sets, 1961: 494,452; television sets, 1960 est., 75,000.

Economic Indicators.—Consumer price index (1953 = 100), 120.3 in 1961 (117.0 in 1960); volume index of production (1961) in major industries (1953 = 100): manufacturing, 134.0 (up 8.5% from 1960); mining and quarrying, 198.6 (up 17% from 1960); transportable goods, 136.8. Gross national product (1961) at current market prices: £704 million (up 6% from 1960). National income in current terms, 1961: £582 million (up £42 million from 1960).

Manufacturing.—In 1961, manufacturing engaged 158,300 persons (up 5,310 from 1960); production included butter, 963,600 cwt.; flour, 567.8 million pounds; beer, 915,720 barrels; potable spirits, 948,480 gallons; and tobacco, 12.5 million pounds. Electricity generated in the year ended March 31, 1962, totaled 2,453 million kw-hr., used by 642,753 consumers. Products of sea fisheries were valued at £1,357,242.

Agriculture.—In 1961 pasture acreage totaled 7,779,900 (up 2.7% from 1960); crop acreage, 3,487,900 (down 4.6%). Acreage of state forests (1960): 305,829. Chief crops, 1961, in acres (with yields in thousand tons): wheat, 344,800 (462); oats, 367,800 (375); barley, 361,700 (507); potatoes, 233,785 (2,111); and hay, 1,630,947 (3,343). In January 1962, cattle numbered 4,129,200 (down 2.6% from January 1961); sheep, 3,375,900 (up 8.7%); pigs, 1,079,700 (up 14.3%); and poultry, 7,552,700 (down 4.8%). Net value of agricultural output, 1961: £169 million.

Foreign Trade.—Ireland's external trade again attained a record level. Total exports, 1961: £180.3 million (up 18.1% from 1960, agricultural produce accounting for 51.8% of total exports); imports, £261.3 million (up 15.0%). Exports to the United States: £13.9 million (in 1960, £11.1 million). Exports (1961) were chiefly foodstuffs (£62.7 million); live animals (£55.4); and manufactured goods (£46.8). Imports (1961) included manufactured goods (£191.1 million); food, drink, and tobacco (£38.7); and live animals (£15.4).

Events, 1962.—Celebrating his 80th birthday on October 14, President de Valera said the outlook for Ireland was better than he could remember. With unemployment falling to less than 5%, and diminishing emigration, the country's buoyant economy in 1962 seemed certain to sustain or surpass the 5% annual growth rate recorded in recent years. Exports of industrial raw materials and manufactured goods had risen from £25 million in 1958 to £50 million in 1961. Having made application on July 31, 1961, to join the European Economic Community, the government instructed working parties in 1962 to study methods of improving Ireland's production of export commodities; on the European continent, survey teams of the Irish Export Board investigated potential new markets.

Using a transmitter on Kippure Mountain, an Irish television service began a regular schedule of 42 hours of programs weekly on January 1.

The Irish Republican Army announced on February 26 the end of a campaign of violence which in the five previous years had caused damage estimated at $14 million and taken the lives of six Northern Ireland policemen and nine IRA terrorists.

The appointment was confirmed by the U.S. Senate on July 12 of Matthew H. McCloskey as United States ambassador to Ireland.

IRON AND STEEL

During 1962 the iron and steel industry continued its worldwide expansion and improvements in the basic oxygen-converter steelmaking process. In June, planned worldwide expenditures for expansion of plants in 1962 were estimated at $6 billion, as follows: United States, $1.3 billion if adequate profits were earned during 1962; Latin American countries, $300 million; United Kingdom, $400 million; European Coal and Steel Community countries, $1 billion; other western European countries, $300 million; USSR, $1 billion; other eastern European countries, $500 million; Japan, $750 million; Canada, Turkey, India, Singapore, Union of South Africa, Australia, and other countries, $450 million.

The world production of crude steel in 1961 was estimated at 392,647,000 net tons. Expansion beyond 1962 was estimated to result in a world annual steelmaking capacity of 591,680,000 tons in 1965.

United States.—Production of crude steel in 1962 was estimated at 98,329,900 net tons, an increase of 313,360 tons or 0.32% over 1961.

On April 6, 1962, collective bargaining agreements, effective July 1, were signed by the United Steelworkers of America and steel companies, about three months in advance of the expiration of the basic labor agreements executed in January 1960. On April 10 the president of the United States and the press were informed that the United States Steel Corporation intended to raise steel prices by an average of 3½%, or $6 a ton. Within two days several steel companies announced their intentions to raise prices. At a press conference on April 11 the president stated that raising steel prices was "wholly unjustifiable and irresponsible defiance of the public interest." Immediate action taken by governmental agencies resulted in decisions by concerned steel producers to withdraw the price increases. (See also LABOR.)

Joint exploration of an iron mineral deposit at Bourbon, Mo., by Granite City Steel Company and American Zinc, Lead & Smelting Company, indicated an estimated 100 million tons of iron ore.

The world's largest plate mill began operating in March at United States Steel Corporation's Gary Works, Gary, Ind. This is the only plant designed as two mills in one (a 160-inch mill and a

210-inch mill) for maximum flexibility in rolling plates up to about 206 inches wide.

Canada.—Crest Exploration, Ltd., a subsidiary of Standard Oil Company of California, discovered a large iron ore deposit between the Snake and Cranswick Rivers in the Yukon.

The Nakina, Ontario, mines of The Anaconda Company were estimated to contain 2 billion tons of iron ore.

The Iron Ore Company of Canada began shipments of concentrated ore in July from its mining operation in Labrador City (formerly Carol Lake), Labrador, and is building a $50 million pelletizing plant. Iron ore concentrates were shipped for furnace tests from nearby Wabush City, Labrador, by the Wabush Iron Company, which plans to reach a capacity of nearly 6 million tons a year by 1965.

The Steel Company of Canada, Ltd., announced a process of direct reduction of iron ore to "usable metallic iron."

Other Countries.—The USSR announced the opening of the surface Northern Mine in the Krivoi Rog area of the Ukraine. Expected annual production is 14 million metric tons of a low-grade ore known as iron quartzite.

PRODUCTION OF IRON ORE, PIG IRON AND FERROALLOYS AND STEEL INGOTS AND STEEL FOR CASTINGS, 1961

(Iron ore data in gross tons of 2,240 lbs.; pig iron and steel ingot data in net tons of 2,000 lbs.)

Country	Iron ore, concentrates, and agglomerates	Pig iron and ferroalloys	Steel ingots and steel for castings[1]

WIDE WORLD

Roger Blough, chairman of U.S. Steel Corp., discusses his company's proposed price increase in television appearance April 12, the day before the $6-a-ton rise was rescinded.

It was reported that investment plans are expected to increase the annual steelmaking capacity of Brazil from 2.3 million tons to 4.5 million by 1965; the major investing countries are Belgium, France, Japan, Luxembourg, and West Germany. The State of Minas Gerais contains 56 billion tons of high-grade ore, but Brazil lacks adequate deposits of coking coal.

Nigeria's first six-year national development plan (1962–68) includes the establishment of its first iron and steel works, using local ore, limestone, coal, and electric power to produce between 125,000 and 250,000 tons of steel annually.

World Production.—The accompanying table shows the world production in 1961 of iron ore, pig iron and ferroalloys, and steel ingots and steel for castings.

Technical Developments.—United Austrian Iron & Steel Works (VOEST), Linz, Austria, reported that improvements in the LD (Linz-Donawitz) basic oxygen process make it possible to produce steel in a converter from a charge containing up to 95% scrap. Additional heat required to utilize large percentages of scrap is obtained by introducing fuel (coke or fuel oil) into the converter.

Republic Steel Corporation reported the development of a process of coating steel strip by passing it through a vacuum in which volatilized aluminum is deposited on the strip.

The British Iron and Steel Research Association developed the "Elphal" process, in which suspended charged particles of aluminum, under the influence of an electric field, are deposited on steel strip, and the aluminum is compacted by rolling and bonded to the strip by heating.

The process of "maraging" steels, the treatment by which it is possible to superimpose age-hardening on a basic martensitic structure, was developed by The International Nickel Company, Inc. The products possess high combinations of strength and toughness.

ISRAEL

A republic of the Middle East, Israel is situated on the eastern shore of the Mediterranean Sea. Its area of 7,993 square miles is about equal to that of New Jersey. The population according to the census estimate of May 22, 1961, was 2,-

170,082 (est. June 30, 1962: 2,293,000). The people are predominantly of Jewish descent; there are small minorities of Arab Muslims, Greeks, and Druzes. The Israeli-held sector of Jerusalem (est. pop., 166,000) is the nation's capital. Other large cities (with estimated populations): Tel Aviv–Jaffa (387,000); Haifa, the chief port (182,000); and Beersheba (42,000). The official language is Hebrew.

Government.—The president of the Israeli republic (Itzhak Ben-Zvi, who was re-elected to a third term on Oct. 30, 1962) is elected for a 5-year term by the Knesset (Assembly). The Knesset has 120 members elected by proportional representation for a 4-year term or less (if the Knesset is dissolved). Party seating (following elections of Aug. 15, 1961): Mapai, 42; Liberal, 17; Herut, 17; National Religious Front, 12; Mapam, 9; and Communist, 5. Premier David Ben-Gurion (Mapai Party) formed a new 4-party coalition government on Nov. 2, 1961.

Education.—The state educational system includes both general and religious primary schools. Primary education is free and compulsory for children aged 5 to 14. About 69% of the school-age population attended school in 1959. Number of schools (with enrollments), 1960–61: 1,151 primary (361,707); 177 secondary (34,576); 59 vocational (11,560); 29 agricultural (5,598); 160 Arab primary and secondary (34,934). Other schools include teachers colleges, Talmudic centers, and many kindergartens. Principal institutions of higher learning are the Hebrew University in Jerusalem (7,300 students in 1961), the Israel Institute of Technology in Haifa (4,900), and Tel Aviv University (825).

Religion.—The Jewish religion is the faith of the great majority, but there is no established church and freedom of religion prevails. The Sabbath and Jewish festivals are official days of rest, although each religious community has the right to observe its own holy days and weekly day of rest. Religious minorities include Muslims (about 166,000); Christians (48,000, chiefly Greek Catholics and Greek Orthodox); and Druzes (23,000).

Immigration.—From the establishment of the state on May 14, 1948, to March 31, 1962, about 1,050,000 immigrants entered Israel. Of the 1948–60 total, 46.6% came from Europe and the Americas, and 53.4% from Asia and Africa. New arrivals in the fiscal year 1961–62 numbered about 60,000. Most immigrants have been productively absorbed in the cities, towns, and agricultural settlements, but some 40,000 lived in temporary camps in early 1961.

Finance.—Estimated budget (ordinary and development), fiscal year 1962–63: I£2,357 million (up 18% from the fiscal year 1961–62). Effective as of Feb. 10, 1962, the Israeli pound was devaluated from a par value of I£1.8 to I£3 to the U.S. dollar. The ordinary budget, which provides for the normal expenditure of government, is covered by tax revenue. The budget for economic development is covered partly by domestic savings and partly by foreign funds, including State of Israel bonds, United States loans and other aid, and German reparations (which amounted to an estimated $110 million in 1961). It was announced on Sept. 23, 1962, that redemption of the first State of Israel bonds, issued in the United States in 1951 and amounting to $24.5 million, would be made beginning on May 1, 1963. Israeli gold and foreign exchange holdings: $275.9 million at the end of 1961 ($209.4 million a year earlier).

Transportation and Communications.—Transport networks (miles, 1960): railways, 392; paved roads, 1,893. Merchant marine (tonnage, 1961): 388,000. Lod International Airport, near Tel Aviv, is used by 11 international lines. El Al Israel Airlines and foreign lines carried 225,420 passengers into and out of Israel in 1960. Other data for 1960: passenger cars, 27,200; commercial vehicles, 25,400; telephones, 117,620; licensed radio sets, 400,000; daily newspapers, 24 (circulation: 500,000).

Economic Indicators.—Gross national product: I£4,451 million in 1960 (up 9% from 1959). General index of industrial production (1955 = 100): 185 in 1961 (160 in 1960). Cost-of-living index (1953 = 100): 155 in 1961 (145 in 1960). Number of workers in labor force: 735,000 in 1961; registered unemployed workers: 6,042 in 1960.

Manufactures and Minerals.—About 65% of Israeli industry (by investment) is operated privately, 20% by state enterprises (mainly in the exploitation of natural resources in the Negev), and 15% by cooperatives or companies controlled by the Histadrut, the General Federation of Labor. Principal manufactures include cut and polished diamonds, metal and electrical equipment, foodstuffs, textiles and apparel, chemicals, rubber goods, paper and cardboard, ceramic and glass products, and cement (846,000 metric tons in 1961). Chief minerals (in metric tons): phosphate rock, 230,000 (in 1960–61); petroleum, 139,000 (1961); potash, 98,000 (1960); copper ore, 435,000 (1959–60).

Agriculture.—Agriculture is organized largely along cooperative and collective lines, and provides about three fourths of the nation's food requirements. Chief crops and outputs (1961 est.): cotton, 65,000 bales of 480 pounds each (up 32% from 1960); tobacco, 5.5 million pounds (up 43%); wheat, 2 million bushels (up 33%); barley, 2 million bushels (up 67%); peanuts, 18,200 short tons (down less than 1%); and citrus (oranges, 13 million boxes of 70 pounds each; lemons, 500,000 boxes of 76 pounds each; and grapefruit, 1.8 million boxes of 80 pounds each).

Foreign Trade.—Total exports, 1961: I£431.3 million (up 9% from 1960); imports, I£1,044.6 million (up 16%). Chief exports: cut and polished diamonds (valued at I£127 million in 1961), citrus fruits (I£86.4 million), metal products, potash, copper, cement, tires, and vehicles. Tourism is another important source of foreign exchange; tourists numbered a record 159,600 in 1961. Israel imports a wide variety of raw materials and capital goods, as well as foodstuffs and other consumer products. Chief trading partners are Great Britain, the United States, and West Germany.

Events, 1962. *Domestic Affairs.*—The most significant internal development was the government's devaluation of the Israeli pound from a par value of I£1.8 to I£3.0 to the U.S. dollar, effective as of February 10. The government stated the action was taken in order to improve Israel's unfavorable balance of payments; make Israeli exports more competitive on the world market, particularly with regard to the European Economic Community; and place the economy on "a firm and stable basis." Commensurate with the introduction of the new exchange rate, existing premium export rates, subsidies for capital transfers, and special tourist rates were abolished. Customs duties on imported equipment and most raw materials were also eliminated, and other import duties were reduced. Subsidies and other governmental measures were subsequently implemented to prevent inflationary price increases.

The devaluation of the currency was a necessary stimulant to economic growth and preceded the government's introduction on June 26 of a four-year plan for economic development (1963–66). The main objective of the plan is to reduce Israel's balance of payments deficit from the $409 million registered in 1961 to an estimated $250 million in 1966 by increasing exports by 20% annually during the four-year period. Fullfillment of this goal requires a corresponding curb on consumer spending, and the plan calls for a reduction in national consumption from the current 90% of total production to 64% in 1966 by means of voluntary savings and, if necessary, direct taxation. Economic growth is to be fostered by governmental measures designed to increase the gross national product by 10% annually, and by development of underpopulated regions in the Negev and Galilee.

The devaluation program was an immediate success. An official estimate placed the annual rate of increase in national production in 1962 at about 10%, with the greatest gains occurring in the manufacturing and construction industries. In the first half of the year, exports rose by 10% and the balance of payments deficit decreased by 14%, to $149.5 million. Capital imports rose substantially, as did foreign investment. The number of unemployed persons declined, and prices registered only moderate increases.

Adolf Eichmann, who had been sentenced to death (on Dec. 15, 1961) by an Israeli tribunal for having directed the Nazi extermination of Jews during World War II, was executed by hanging at Ramleh prison on May 31. Although the execution was the first to take place in Israel, it received but cursory attention there and abroad, unlike Eichmann's four-month trial in 1961 which had aroused the indignation of the world against the bestial atrocities that had been committed by the Nazis. Eichmann's legal appeal against his conviction was rejected by the Israeli Supreme Court on May 29, 1962, and his plea for mercy was denied by President Itzhak Ben-Zvi shortly before the execution took place.

Israeli courts in January separately convicted

two Israeli citizens of having spied for an unspecified Communist country. Dr. Israel Beer, a former Defense Ministry official and an expert on military planning, was sentenced on January 14 to ten years' imprisonment after being convicted on charges of having supplied information to a foreign agent. Earlier, Aharon Cohen, a prominent member of the leftist Mapam Party, had been sentenced to five years' imprisonment following his conviction on similar charges. Beer's prison sentence was increased by five years on November 27 by the Supreme Court, which reversed a lower court's acquittal of the defendant on one charge concerning the transmission of security information.

Foreign Affairs.—Israeli-Arab conflicts in frontier areas continued to occur during the year. The major clash took place on March 17 when Israeli armed forces briefly invaded Syrian territory north of Nuqeib, on the Sea of Galilee, and destroyed Syrian fortifications. Israel claimed that 30 Syrian and six Israeli soldiers were killed; Syria reported 14 Syrian and 36 Israeli deaths. According to a communiqué issued by the Israeli Army, the raid was in retaliation for attacks by Syrian shore batteries on Israeli patrol boats in the Sea of Galilee early in the month.

Both Israel and Syria filed protests with the United Nations; the Israeli note of March 17 defended the army raid as an act of self-defense. The UN Security Council on April 9 indirectly censured Israel for the attack by reaffirming an earlier resolution (in 1956) which condemned Israeli military actions for violating the armistice agreement. The resolution was "categorically" rejected on April 10 by the Israeli Knesset, which upheld Israel's right to retaliate against military provocations in frontier areas.

Israel's long-standing request for defensive weapons was agreed to by the United States in September. The U.S. Department of State disclosed on September 26 that Israel would be supplied with short-range Hawk missiles. Washington's policy of not supplying any Middle Eastern country with large amounts of military equipment was reversed because of the threat to the military balance of power in the Middle East posed by recent shipments of Soviet missiles and jet aircraft to the United Arab Republic and other Arab countries. Israel will be the first non-Western nation to receive American-made missiles, and Israeli missile crews are to be trained in the United States. The first shipment of Hawk missiles is expected to arrive in Israel in late 1963.

The Israeli government on July 1 deported Dr. Robert A. Soblen,[1] convicted Communist spy who had jumped bail in the United States and had fled to Israel. Soblen's deportation was complicated by the lack of an extradition treaty between Israel and the United States, but Premier Ben-Gurion's cabinet ruled that the nation's Law of Return permitting any Jew to enter Israel and claim citizenship did not apply to criminal fugitives. An extradition treaty signed on December 10 by Israel and the United States was in part intended to prevent a recurrence of such an incident. The Supreme Court on December 6 ruled that a Jew who becomes a Christian convert "is not called a Jew" and is not entitled to claim Israeli citizenship under the Law of Return. The court ruling was made in the case of a Jewish-born Roman Catholic monk who had claimed Jewish nationality.

W. R. F.

[1] **Robert A. Soblen** was born near Kaunas, Lithuania, on Nov. 7, 1900; his name was originally Ruvelis Leiba Sobolevicius. He studied medicine in Germany and Switzerland. With his brother Jack (who anglicized his name as Soble), he joined the Communist Party in his youth; the brothers were expelled as Trotskyites in 1929, but immediately began spying on their former comrades for the Bolsheviks. Arriving in the United States in 1941, they settled in New York City and began spying for the Soviet Union. Soblen, a practicing psychiatrist, was indicted on a charge of espionage in November 1960, and was found guilty in United States District Court on July 13, 1961, after a month-long trial. (One of the chief government witnesses was Jack Soble, who himself was sentenced to prison for espionage in April 1957 and was released from custody on Aug. 31, 1962.) Sentenced to life imprisonment on Aug. 7, 1961, Soblen was freed on $100,000 bond and began a fruitless series of appeals. On June 25, 1962, the day before he was to begin serving his sentence, he forfeited bond and disappeared. Discovered in Tel Aviv, Israel, on June 28, he was placed aboard a plane for New York on July 1, but stabbed himself while en route in an attempt to win asylum in England. He was ordered deported from Great Britain after a long legal battle. On September 6, while being taken to the London airport for a flight to New York, he swallowed a large quantity of barbiturates which apparently had been smuggled to him and which resulted in his death on September 11.

ITALIAN LITERATURE

The two best sellers that received the main Italian literary prizes awarded in 1962 represent different aesthetic trends. Mario Tobino's *Il Clandestino*, crowned by the Strega Prize, is a lengthy chronicle of the Resistance movement on the Tuscan coast. It abounds in comic and tragic episodes and in sketchy character portrayals. Despite its authenticity and honesty, this long-winded narrative seems more a historical document than a work of imaginative fiction, and its success can be explained precisely by its truthfulness to life. In that sense it is akin to a series of novels published recently in Italy and hailed by all the lovers of representational art in the 19th-century style. Such is the case of Michele Prisco's *La dama di piazza* (1961), the story of a Neapolitan family between 1919 and 1945, centered around the adventures of its heroine, an upstart from the lower middle class. Another realistic picture, this time of a Roman family at the end of the last century, can be found in *Le finestre di piazza Navona* (1961), a posthumous autobiographical novel by the theater historian and critic Silvio D'Amico. Neorealistic novels also fared well with the public. *Un cuore arido* (1961), by Carlo Cassola, depicting the love life of a Tuscan seamstress in prewar Italy, sold over 50,000 copies.

A different current is represented by *Il Giardino dei Finzi-Contini*, by Giorgio Bassani, awarded the Viareggio Prize. A psychological novel, almost in Proustian manner, it is the story of an unrequited love projected against the background of the tiny Jewish community in Ferrara. The elusive quality of the heroine, the subtle analysis of thoughts and feelings of all the protagonists, and the poetic aura that envelops their tragic fate make this book moving and captivating. It sold 100,000 copies in a few months, and Bassani is now becoming one of Italy's leading literary figures. Other psychological novels included: Manlio Cancogni's *Parlami, dimmi qualcosa*, a bitter, half-lyrical, half-ironical analysis of a disintegrating marriage; *Una lunga pazzia*, by Antonio Barolini, who depicts religious obsession in a Venetian family; *Lungo equinozio*, by Angela Bianchini, awarded the Borletta Prize for her first work of fiction, which analyzes the inner world of an Italian girl living in New York and then returning to Rome; and *L'uomo di sfiducia*, Tullio Kezich's sequence of novelettes portraying the moods of a movie director.

Somewhere between the purely psychological and environmental novels stands the greatly discussed *Le mosche d'oro*, by Anna Banti; it is an ambitious attempt to depict modern youth and its anxieties by unfolding the lives of Denise, a Parisian of well-to-do family, and her lover Liberio,

a peasant painter from Tuscany, whom she abandons, leaving him her child. The descriptive part of the book is more convincing than its pseudo-Freudian exploration of Denise's pathological extravagances and Liberio's anger and frustration.

A place apart has been occupied lately in Italian fiction by satirical novels whose authors are strongly attracted by the grotesque and the existentialist notion of the absurd. The long list of works in this category is led by *Il maestro di Vigevano,* by Lucio Mastronardi, a teacher in the Lombard town that he describes. This somewhat eccentric, compact, and highly imaginative work is more than a satire and an attack on middle-class bigotry and meanness: its rendition of a provincial way of life becomes a symbol of man's spiritual and sexual anxieties. Several Italian critics consider this book the most interesting literary event of the year. Very close to Mastronardi's spirit are *Il calcinaccio,* a satirical picture of a private school in Rome, by Giuseppe Cassieri; *La torre di torture,* short stories by Fernando Tempesti, a young Tuscan; and *Il sosia,* novelettes by the Triestino, Stelio Mattoni.

Alberto Moravia published *Un' idea dell' India,* a small book of travel impressions which do not go beyond journalistic sketches. The case of Lorenzo Calogero, a physician of Calabria who died in 1960 and whose posthumously published poems provoked great critical enthusiasm, gave rise to a number of essays and polemics in Italian periodicals.

Translations.—The following is a selected list of Italian books translated and published in English in 1962 (unless otherwise noted): Alvaro, Corrado, *Revolt in Aspromonte,* tr. by Frances Frenaye from *Gente in Aspromonte;* Arpino, Giovanni, *The Novice* (1961), tr. by Peter Green from *La suora giovane;* Calvino, Italo, *The Nonexistent Knight* and *The Cloven Viscount,* tr. by Archibald Colquhoun from *Il cavaliere inesistente* and *Il visconte dimezzato;* Cassola, Carlo, *Bebo's Girl,* tr. by Marguerite Waldman from *La ragazza di Bube;* Celletti, Rodolfo, *Marta,* tr. by Raymond Rosenthal from *Viale Bianca Maria;* Levi, Carlo, *The Linden Tree,* tr. by Joseph M. Bernstein from *La doppia notte dei tigli;* Roberto, Federico de, *The Viceroys,* tr. by Archibald Colquhoun from *I vicerè;* Silone, Ignazio, *Bread and Wine,* tr. by Harvey Fergusson II from the revised version of *Pane e vino;* Strati, Saverio, *Terrarossa,* tr. by Elizabeth Ellman from *La teda;* and Golino, Carlo L., ed., *Contemporary Italian Poetry.*

Director, Sarah Lawrence College Foreign Studies; Editor, "Modern Italian Short Stories."

ITALY

The Italian Republic consists of a boot-shaped peninsula extending southeastward from the European mainland into the Mediterranean Sea, the large islands of Sicily (with adjacent islands, 9,926 square miles; 1961 pop., 4,711,783) and Sardinia (with adjacent islands, 9,301 square miles; 1961 pop., 1,413,289), and about 70 smaller islands. Its total area is 116,303 square miles. The country is divided into 19 regions, which are subdivided into 92 provinces and 8,007 communes. Thus far only Sicily, Sardinia, Valle d'Aosta, and Trentino-Alto Adige have gained regional semiautonomy, but plans are being made to expand such decentralization.

Population.—Italy's population totaled 50,463,762 at the Oct. 15, 1961, census. The largest cities, with 1961 census populations, are Rome, the capital, 2,160,773; Milan, 1,580,978; Naples, 1,179,608; Turin, 1,019,230; Genoa, 775,106; and Palermo, 587,063.

Government.—Parliament is composed of a Chamber of Deputies of 596 members elected for 5 years, and a Senate of 248 members, of whom 246 are elected for 6 years and 2 are life members. In the Parliament elected on May 25–26, 1958, party alignments are as follows:

	Chamber of Deputies[1]	Senate[1]
Christian Democrats	273	123
Communists	140[2]	59
Italian Socialists	84[3]	36[4]
Monarchists	25[5]	6[6]
Italian Social Movement (MSI)	24	9[7]
Democratic Socialists	22[8]	5
Liberals	17[9]	4
Republican-Radicals	6	0
South Tirol People's Party	3	2
Others	2[10]	2[11]
Total	596	246[12]

[1] By Jan. 1, 1962, deaths and party switches had resulted in the following changes: [2] 141; [3] 86; [4] 35; [5] 19; [6] 7; [7] 8; [8] 18; [9] 22; [10] 4; [11] 3; [12] plus 2 senators for life.

On May 6, 1962, at a joint session of Parliament in which 10 delegates from the regional councils also participated, Antonio Segni, a Christian Democrat, was elected to a 7-year term as president of the republic, replacing Giovanni Gronchi, another Christian Democrat, he was sworn in on May 11. Amintore Fanfani, also a Christian Democrat, became premier for the fourth time on Feb. 22, 1962.

A Constitutional Court of 15 judges has functions similar to those of the Supreme Court of the United States.

Religion.—Except for about 150,000 Protestants, 40,000 Jews, and several thousand persons of the Orthodox faith, Italy is a Roman Catholic country, but absolute freedom of worship is guaranteed by the constitution of 1948. As of 1960 there were 280 Roman Catholic dioceses and 25,930 parishes.

Education.—In the 1958–59 school year enrollment was as follows: kindergartens, 1,088,428; elementary schools, 4,606,940; junior high schools, 590,394; vocational schools, 559,663; technical schools, 359,693; scientific secondary schools, 53,698; classical secondary schools, 144,280; normal schools, 105,432; and art schools, 28,752. Universities and other institutions of higher education had 163,945 regular and 67,145 special students. Since 1958–59 enrollment has increased enormously, causing the Fanfani government to scrap its 1958 10-year educational development program and substitute a high-priority three-year plan for 1962–65 (approved by Parliament in July 1962).

Because of stricter enforcement of the compulsory education law (ages 6 to 14) and expansion of facilities for the education of illiterate and semi-illiterate adults, the number of illiterates declined from 5,056,685 in 1951 to about 3,300,000 in 1960, of whom approximately 2,044,000 could still be taught.

Budget.—The 1961–62 budget provided for expenditures of 4,025,858 million lire (620.6 lire equal U.S.$1) and revenue of 3,651,956 million, leaving a deficit of 373,902 million. The 1962–63 budget estimates called for expenditures of 4,585,994 million lire and a deficit of 276,800 million.

Transportation and Communications.—As of Dec. 31, 1960, Italy had 13,226 miles of railways, of which 10,185 miles were operated by the Italian State Railways. Of the latter, 4,803 miles had been electrified, and about one fourth were double tracked. Impressive new stations in Naples (Central) and Milan (Porta Garibaldi) were opened in 1961. In 1960, 547,396,000 passengers were carried on all types of railways. Though the number of rail passengers increased somewhat over 1959, the amount of freight hauled by rail declined slightly, to 69 million metric tons. By way of contrast, freight hauled by truck, water, and air increased in volume.

As of Dec. 31, 1960, there were 118,419 miles of roads, 1,994,724 cars, 17,306 buses, 439,115 trucks, and 3,916,783 motorcycles. Boring of the 3.6-mile highway tunnel to Switzerland through the Great St. Bernard Pass was completed on April 5, 1962, and boring of the 7.2-mile tunnel to France through Mont Blanc on Aug. 14, 1962.

There are 5 international, 20 national, and 33 club airports in the country. During 1961, 3,765,000 passengers were flown in domestic and international traffic, as compared with 2,911,000 in 1960.

The merchant marine on March 31, 1962, consisted of 3,863 vessels of 5,502,113 gross tons, making it the sixth largest in the world. In 1960, 74,678,000 metric tons of cargo were unloaded and 27,091,000 tons loaded in Italian ports.

Telephones numbered 3,860,849 on Jan. 1, 1961; radio sets, 8,487,860 on Dec. 31, 1961; and television sets, 3,202,450 in 1962.

Economic Conditions.—Italy's "economic miracle" continued for a second year in 1961, but the boom leveled off somewhat in 1962. The main factors behind the country's unaccustomed prosperity are a sharp increase in domestic purchasing power (wages and salaries rose by 9.9% in 1961); a steady foreign demand for Italian products, facilitated by Italy's improved trading position as a member of the European Economic Community

(EEC; Common Market); and satisfactory gold and foreign currency reserves. Whereas the economy prospered in 1961 without inflation (the wholesale price index rose by only 0.2% and the retail index by 2.1%), in the first 6 months of 1962 the cost-of-living index (1938 = 1) climbed from 70 to 75. Even so, the rise was less than that in other western European countries. To combat price increases, Italy adopted in August 1962 a 10% tariff reduction on many items.

Measured in real terms (that is, after allowing for price increases), the gross national product increased by 7.9% in 1961, compared with 6.8% in 1960, 8% in 1959, and an average of 5.8% in the decade 1950–60. Resources available for use in Italy (which amount to $39.8 billion if the value of imports is added to the gross national product) rose by 9% over 1960 (7.6% in real terms), and were distributed as follows: $24.9 billion for consumption, $8.6 billion for investments, and $6.3 billion for exports. One of the most significant aspects of the bright economic picture in 1961 was that the three sectors of the economy (agriculture, industry, and services) achieved a closer balance than in 1960. Industrial activity, which in 1960 had increased by 13%, rose by about 9% in 1961. Agriculture, which had registered gains of only 2% in the past few years, went up by 5.3% in 1961. Service activities increased by about 9%.

For the first time, the south's rate of economic growth exceeded that of the rest of the country in 1961. Net per capita income rose by 14%, compared with 8.9% in the center and north, and 9.9% in the country as a whole. Despite such improvement, the disparity between north and south remained troublesome. During 1962, however, huge new basic industries were launched in Taranto, Brindisi, Ferrandina, and northeastern Sicily.

Unemployment, which for several years after World War II had hovered at 2,000,000 (in a work force of 20,000,000), was cut in half by 1960, and at the end of 1961 stood at about 500,000, most of whom were unskilled. An acute shortage of skilled labor exists, and efforts are being made to train such workers. There is a steady migration from the south to the more industrialized north. From 1960 to 1961, employment increased in Italy by 2.4%, a higher rate than in any other EEC country.

The general index of industrial production (1958 = 100) rose from 128 in 1960 to 140 in 1961; in the first 6 months of 1962, it averaged 152. Expansion of production was concentrated in the chemical, petrochemical, mechanical, and building industries. Chemical production in 1961 was 12.8% greater than in 1960. The output of portable typewriters and calculators jumped from 721,781 units in 1960 to 1,029,500 in 1961, while that of motor vehicles rose from 693,400 to 883,820 and, in the first 7 months of 1962, by a further 21.9%. Output of other important industrial products, in thousands of metric tons, was as follows in 1961 (1960 figures in parentheses): iron ore, 1,200 (1,248); coal and lignite, 2,254 (1,532); cement, 17,568 (15,636); crude petroleum, 1,968 (2,016); ferroalloys, 144 (141); pig iron, 3,056 (2,683); crude steel, 9,126 (8,229); and hot rolled steel, 7,195 (6,631).

Except for synthetic fibers, textile production was only moderately good in 1961. Shipbuilding was in crisis, and the output of motor scooters dropped. Despite a 23.3% increase in gasoline consumption, the oil refining industry was in difficulties. On the other hand, production of natural gas rose from 6,444 million cubic meters in 1960 to 6,888 million in 1961, and that of electricity from 54,288 million kw.-hr. to 58,668 million.

PICTORIAL PARADE

President Antonio Segni (left) and Premier Amintore Fanfani (right) of Italy talk cordially with U.S. Secretary of State Dean Rusk during his visit to Rome on June 23.

Antonio Segni was born in Sassari, Sardinia, on Feb. 2, 1891. A graduate of the University of Rome (1913), he served as an artillery sergeant in World War I and subsequently taught at the universities of Perugia (1920–25), Cagliari (1925–29), Pavia (1929–31), Sassari (1931–54), and Rome (1954–55). Segni entered politics in 1919 as an anti-Fascist member of the Italian Popular Party, the predecessor of the Christian Democratic Party. After World War II, Segni was elected to the Constituent Assembly which drafted the Italian Constitution, and in 1948 he became a member of the Chamber of Deputies. While minister of agriculture (1946–51), he played a prominent part in obtaining land reform legislation. After serving as minister of public information (1954), he led a coalition government (1955–57) without the support of leftist parties. Strongly pro-Western, Segni again served as premier in 1959–60. Later, as foreign minister (1960–62), he continued to advocate a policy of firm alliance with the West. On May 6, 1962, Segni was elected to a 7-year term as president of the republic.

Amintore Fanfani was born in Pieve Santo Stefano, Tuscany, Feb. 6, 1908. After receiving a doctorate from the Catholic University of Milan (1932), he taught there and in Venice from 1936 to 1943, when he fled to Switzerland until the end of World War II. The author of some 40 books, he has held the title of professor at the University of Rome since 1954. Fanfani entered politics in 1946 as a Christian Democrat. While minister of labor and social welfare under Alcide de Gasperi (1947–50) he achieved notable success in planning workers' housing and organizing non-Communist labor unions. He also served as minister of agriculture (1951) and interior (1953). In 1954 and again in 1958–59 he was premier. Progressive minded and pro-Western, he led a coalition government of Christian Democrats and other center parties from July 27, 1960, until Feb. 2, 1962, when he resigned and formed a new cabinet with the support of the Nenni Socialists on February 21.

Palmiro Togliatti, leader of the Italian Communist Party, waves a cigar presented to him by Blas Roca, Cuban delegate to the Italian Communist Party Congress, December 5.

UPI

The agricultural sector of the economy, after two poor years, showed a 5.3% increase in the volume of gross salable production in 1961, with a net product of $4.9 billion, or 10.9% above 1960. Costs continued to increase out of all proportion to revenue. Production of major crops in 1961, in thousands of metric tons (with 1960 figures in parentheses), was as follows: wheat, 8,292 (6,794); corn, 3,940 (3,813); rough rice, 674 (622); barley, 279 (232); oats, 585 (431); potatoes, 3,932 (3,818); tomatoes, 2,684 (2,708); sugar beets, 6,750 (7,554); dry broad beans, 391 (440); apples, 2,150 (1,832); pears, 790 (622); figs, 319 (295); grapes, 8,515 (8,642); olive oil, 390 (380); oranges and tangerines, 983 (824); and lemons, 378 (351). Mechanization of agriculture resulted in the migration of 300,000 farm workers to cities in 1961, while the number of tractors rose from 248,985 to 272,849.

Fund for the South.—From its inception in 1950 through March 1962, the Fund for the South (Cassa per il Mezzogiorno), a 15-year program for the rehabilitation of depressed areas in southern Italy, Sicily, and Sardinia, approved and started 13,292 public works projects ($1.9 billion) and 201,020 privately operated projects (over $800 million). The program was accelerated sharply in the fall of 1961.

UPI

Rome's historic Castle Sant' Angelo, near the Vatican, is illuminated while the 21st Ecumenical Council is in session.

Foreign Trade.—From 1958 through 1961, Italian exports rose by 62.5%. In 1961 they were valued at 2,617.3 billion lire, as compared with 2,280.2 billion in 1960. Imports amounted to 3,264.0 billion lire (2,953.2 billion in 1960). Imports from EEC countries comprised 29.5% of the total value in the first 11 months of 1961, while exports to these countries made up 31.7% of the total. In the first 6 months of 1962, total exports were valued at 1,416.1 billion lire, and imports at 1,813.3 billion. Because of tourist expenditures and other invisible exports, Italy's gold and foreign exchange reserves rose from $3,080 million on Dec. 31, 1960, to $3,419 million on Dec. 31, 1961. In July 1962, to help the United States alleviate its balance-of-payments deficit, Italy repaid in advance postwar loans and other aid amounting to $178.1 million, plus interest. The number of foreigners visiting Italy increased from an estimated 18 million in 1960 to 19 million in 1961 and to 20 million in 1962.

Events, 1962. *Domestic Affairs.*—The most significant political development early in 1962 was the decision (February 1) of the Christian Democratic Party Congress, dominated by Party Secretary Aldo Moro, to seek a parliamentary alliance with Pietro Nenni's Italian Socialist Party, now that the latter had renounced its "unity of action" pact with the Communists. This long-awaited "opening to the left" by the Christian Democrats, who lacked a majority in the Chamber of Deputies, cleared the way for a new governing coalition to enact reform legislation that hitherto had been blocked by the chronic parliamentary stalemate. Implementing the decision of his party's congress, Premier Fanfani on February 2 tendered the resignation of his cabinet, which had been in office since July 1960 with the support of Republicans, Democratic Socialists, and Liberals. On February 10, President Gronchi asked Fanfani to form a new cabinet, which he did on February 21; it was sworn in the next day.

The new center-left government consisted of 19 Christian Democrats, 3 Democratic Socialists, and 2 Republicans. Addressing Parliament on March 2, Premier Fanfani promised that he would avoid totalitarianism, safeguard the North Atlantic Treaty Organization (NATO), decentralize and modernize public administration, nationalize the electric power system, and work for programmed economic development, with special emphasis being given to the south, land redistribution, and tax reform.

Though Nenni's left-wing Socialists were not included in the cabinet, they provided Fanfani with indispensable support in Parliament. At the municipal level and in labor organizations, however, they often still cooperated with the Communists. In October, Nenni offered the Christian Democratic Party a five-year agreement on economic planning if the government took immediate steps to implement regional autonomies.

The seven-year term of President Giovanni Gronchi ended in May. After a heated contest between Democratic Socialist Giuseppe Saragat and Christian Democrat Antonio Segni, the latter was elected president on May 6 by a joint session of Parliament in which 10 delegates from the regional councils also voted. The new president is a native of Sardinia. As ex-president, Gronchi automatically became a senator for life.

On June 10–11, municipal elections, involving 9.7% of the nation's voters, took place in Rome, Naples, Bari, Foggia, Pisa, and several other cities. The new center-left coalition was gratified by the results, for the Communists lost votes to the two Socialist parties, while the Monarchists lost to the Liberals. The neo-Fascistic MSI remained isolated. Christian Democrats suffered minor losses. In elections held on November 11–12 in 268 municipalities, the Liberals and Christian Democrats registered gains.

Notable legislation adopted by Parliament included a bill enacted in May to authorize the expenditure of $645 million for the economic development of Sardinia. On July 24, the Chamber of Deputies approved the first reading of a government bill to grant semiautonomy to the region of Friuli-Venezia Giulia. The bill was opposed by conservatives, who feared that its adoption might prejudice Italian claims to territory east of Trieste. As a constitutional measure, it must be submitted in two successive sessions at an interval of not less than three months and be approved by an absolute majority of each house.

In light of the 1961 census, the Chamber of Deputies voted on August 7, and the Senate on September 21, to increase the size of the next Parliament, which would have 630 deputies instead of 596 and 315 senators rather than 248. The term of office of senators was reduced from six to five years, the same as that served by deputies.

On September 21, the Chamber of Deputies passed a government bill to nationalize the electric power industry; it received final parliamentary

approval on November 27. Anxious to avoid isolation, Communists voted for the measure; opposition came from Liberals, Monarchists, and the MSI. Christian Democratic leaders argued that the measure was necessary to destroy the influence of private monopolies, but made it clear they had no intention of nationalizing other sectors of the economy.

Foreign Affairs.—On Nov. 28, 1961, the UN General Assembly had passed an Italian-backed resolution urging the resumption of bilateral negotiations by Austria and Italy on the problem of the degree of autonomy that should be granted to the 250,000 German-speaking inhabitants of the Alto Adige (South Tirol). Sporadic violence continued in this region in January and February 1962, and again in July and October, when bombs exploded in Bolzano and Trent. In March, Austria expressed willingness to resume talks. Foreign Ministers Attilio Piccioni and Bruno Kreisky met in Venice on July 31. In September, they agreed not to raise the dispute in the UN General Assembly because a study committee appointed by Italy indicated hope for progress. Meanwhile, on September 15, Italy rescinded a requirement (in effect since July 1961) that Austrians obtain visas to enter Italy. (See also AUSTRIA.)

When Premier Fanfani formed his center-left government, concern was voiced that, in view of Nenni's qualified support of NATO, the new cabinet might tend toward neutralism. While disclaiming any possibility of neutralism, the government did seek to improve relations with the Soviet bloc and with nonaligned countries. At the same time, it firmly maintained its commitment to NATO, which has important bases in Italy. Faced by considerable leftist sympathy for Cuba during the October world crisis, Fanfani noted that NATO was not directly involved, and expressed pleasure that the United States was willing to let the United Nations help solve the crisis.

In addition to maintaining its allegiance to NATO and to the United Nations (for example, by purchasing $8,960,000 in United Nations bonds), Italy remained a staunch member of the EEC. She encouraged discussions between France and Great Britain concerning the latter's admission to the EEC. Italy favored early British entry, provided that London agreed to abide by the basic rules of the Common Market. She hoped that the political unification of Europe would result from economic integration.

Italian relations with the United States remained very cordial. In February, Attorney General Robert F. Kennedy visited leaders in Rome, while in August, Mrs. John F. Kennedy and her daughter vacationed in Ravello. Secretary of State Dean Rusk conferred with high officials in Rome on June 23, and on September 4–7, Vice President Lyndon B. Johnson paid an official visit to Rome, where he initialed a convention calling for collaboration in space studies. On September 17, Defense Minister Giulio Andreotti and Gen. Giuseppe Aloia, chief of staff of the Italian Army, arrived in Washington for a two-week tour of United States military installations.

Italy's interest in Africa was underlined by Premier Fanfani's visit to Morocco in January, his visit to Tunis in June, his prompt recognition of the new Algerian Republic in July, and the visit to Rome in September of President Habib Bourguiba of Tunisia. Meanwhile, the 11th Italy-Africa Congress met in Milan in May, and the annual Fair of the Levant in Bari emphasized commercial relations with Africa.

CHARLES F. DELZELL,
Professor of History, Vanderbilt University.

IVORY COAST

The Republic of Ivory Coast is situated on the Gulf of Guinea in western Africa, and has an estimated area of 124,503 square miles. The population of 3,300,000 (mid-1961 est.) consists chiefly of African tribesmen, and includes about 25,000 persons of French descent. French is the official language. Principal cities: Abidjan (1960 est. pop., 187,500), the capital and chief port; and Bouaké (1959 est., 70,000).

Government.—This former French overseas territory within French West Africa became independent on Aug. 7, 1960. The president of the republic and a cabinet are responsible to a 70-member National Assembly, elected directly by universal suffrage for a five-year term. In national elections of Nov. 27, 1960, Félix Houphouët-Boigny, leader of the African Democratic Rally, was elected president, and his party won all the assembly's seats. Ivory Coast is a member of the Council of the Entente within the French Community.

Education and Religion.—An estimated 45% of the school-age population attended school in 1962. School enrollment, 1961: primary, 234,364; secondary, 11,349; technical, 4,546; and higher, 126 (1959). About 65% of the population are animists; 23.5% are Muslims; and 12.5% are Christians.

Finance.—The ordinary budget for 1962 was balanced at an estimated 26,800 million francs CFA (246.85 francs CFA equal the U.S. dollar). The development budget totaled about 1,000 million francs CFA. French aid in 1961 was equivalent to $50 million. In early 1962 the government established a National Fund for Investment, to be financed by compulsory loans from business and real estate enterprises.

Transportation and Communications.—Transport networks (miles, 1960): railways (Abidjan-Ouagadougou, Upper Volta), 375; surfaced roads, 6,200; asphalt roads, 520. Abidjan has an international airport. Number of motor vehicles: 25,470 (1960); licensed radio receivers, 50,000 (1959 est.).

Agriculture.—About 90% of the working population is engaged in agriculture, forestry, and fishing. Chief subsistence crops are yams, cassava, taro, rice, millet, corn, and peanuts. Chief cash crops (metric tons exported, 1961): green coffee, 153,766; bananas, 91,483; cacao, 88,467; palm kernels, 12,487; and groundnuts, 24,000 (est. output, 1960–61 crop year). The thick tropical forests yield mahogany, rubber, and timber (792,691 metric tons exported in 1961).

Manufactures and Minerals.—Industrial production, 1960: 10 billion francs CFA (up 17% from 1958). In-

President Houphouët-Boigny of the Republic of Ivory Coast and his wife are guests of President and Mrs. Kennedy at a state dinner during visit to the United States in May.

WIDE WORLD

dustries include a French-owned automobile assembly plant, some 30 sawmills and two plywood factories, and a few soap factories, textile mills, and plants for producing palm oil, margarine, canned fruits and fruit juice, and canned tuna. Output of electric power, 1961: 92.3 million kw.-hr. (up 37% from 1960). The only minerals mined are manganese ore and diamonds (106 kilograms exported in 1961).

Foreign Trade.—Total exports, 1961: 43,603 million francs CFA (up 17% from 1960); imports, 37,008 million (up 25%). Chief exports (in million francs CFA, 1961): green coffee, 20,174; cacao, 9,809; and timber, 8,341. Main imports are machinery, vehicles, textiles, and other manufactures. France in 1961 took 51% of Ivory Coast's exports and supplied 70% of its imports.

Events, 1962.—Unlike the strongly anticolonialist and neutralist regimes in neighboring Ghana and Guinea, the government of the Ivory Coast continues to maintain close cooperation with France and to pursue pro-Western policies. President Houphouët-Boigny, in an address to the National Assembly early in the year, pointedly referred to France as "our best friend," and reiterated his intention of retaining French technicians and administrators to supervise the nation's economy until his own people are able to take over within a few years. France virtually monopolizes the country's trade and commerce, invests heavily in new industries, and assumes responsibility for military defense. The resultant economic progress and political stability in the Ivory Coast has served to vindicate the government's policies, and both political opposition and popular discontent are slight.

President Houphouët-Boigny visited the United States from May 9 to 29. He conferred in Washington with President Kennedy on May 22–23, and a joint communiqué issued after the talks announced that the United States would provide aid to the Ivory Coast for economic and social development, including a loan of $5 million to help the nation set up a development bank.

W. R. F.

JAMAICA—Princess Margaret is saluted in Kingston at ceremonies marking former colony's independence.

WIDE WORLD

JAMAICA

Formerly a member of the West Indies federation (q.v.) and an internally self-governing British colony, the Caribbean island of Jamaica became an independent dominion within the Commonwealth of Nations on Aug. 6, 1962. Jamaica is situated in the Greater Antilles, about 90 miles south of Cuba. The area is 4,411 square miles. The census population of April 7, 1960, was 1,613,880 (March 1962 est., 1,647,000), most of whom were of Negro stock. The capital and chief seaport is Kingston (1961 pop., 141,306).

Jamaica's flag bears a diagonal gold cross on a field of vertical triangles of emerald green and horizontal triangles of black.

Government.—Jamaica is a constitutional monarchy; Queen Elizabeth II is the sovereign. The new constitution, effective as of Aug. 6, 1962, provides for a governor-general (Sir Kenneth Blackburne, who had served as governor since 1957) appointed by the sovereign; a Privy Council of six members appointed by the governor-general; and a cabinet consisting of a prime minister and at least 11 other ministers. The bicameral legislature comprises a Senate of 21 members appointed by the governor-general, and a House of Representatives of 45 members elected by universal adult suffrage for five-year terms. Party seating in the House following the elections of April 10, 1962 (with previous number of seats held in parentheses): Jamaica Labour Party, 26 (15); People's National Party, 19 (27); and independents, 0 (3). Sir Alexander Bustamante (Labour) was sworn in as prime minister on April 24, 1962. (See also below, *Events, 1962.*)

Education and Religion.—About half of the school-age population attends school. Number of public schools (with enrollments), 1961: 725 primary (281,779); 41 secondary (16,258); 4 technical; 5 teacher-training; and one college of arts, science, and technology. The University of the West Indies at Mona, St. Andrew, became an autonomous institution in 1962. The population is predominantly Protestant, most of whom belong to the Church of England; Roman Catholics numbered 111,600 in 1960.

Finance.—Government revenue, fiscal year 1962–63 est.: £43,663,861 (£43,130,983 in fiscal 1961–62); expenditure: £43,239,493 (£42,007,645). Public debt: £37,368,719 at end of 1960–61.

Transportation and Communications.—Transport networks (miles, 1961): railways, 249; main roads, 2,678; local roads, 6,204. Ship arrivals (1960): 1,459 vessels (net tonnage, 4,410,441). British West Indian Airways and ten other airlines serve the island. Passenger cars (1960), 34,000; telephones, 34,976; radio receivers (1959), 147,000.

Production.—Principal economic activities are mining and agriculture, but manufacturing is of growing importance. Jamaica is the world's largest exporter of bauxite (4,975,000 metric tons in 1961) and an important supplier of alumina (703,000 metric tons). Chief crops for export are sugar (380,000 metric tons in 1961) and bananas (307 million pounds).

Foreign Trade.—Domestic exports, 1961: £60.6 million (up 4% from 1960); total imports: £75.2 million (down 3%). Chief exports and 1961 values: alumina, £16.9 million; sugar, £14.5 million; bauxite, £13.1 million; and bananas, £4.6 million. The trade deficit was partly offset by foreign exchange earnings of £13.5 million from tourism in 1961, when there were 224,492 visitors to Jamaica.

Events, 1962.—Jamaica on August 6 became the first of the British West Indian dependencies to attain full sovereignty and independence. Princess Margaret of Great Britain, accompanied by her husband, Lord Snowdon, represented the queen at the colorful independence celebrations in Kingston. She presided at the opening session of

the new Jamaican Parliament on August 7, and expressed the personal good wishes of Queen Elizabeth for the success of the new nation. In his address of reply, Prime Minister Sir Alexander Bustamante paid tribute to Britain for the enlightened rule of the island during the past 307 years. The United States was represented at the independence ceremonies by Vice President Lyndon B. Johnson.

Provisions for independence were agreed to by British and Jamaican representatives at a constitutional conference held in London from February 1 to 9. The conferees set the date for independence, applied for Jamaica's membership as an independent state within the Commonwealth, approved the new constitution, and arranged for continued Jamaican support of common services of the West Indies federation, from which Jamaica had elected (in a referendum of Sept. 19, 1961) to secede. The Jamaican Independence Bill was enacted by the British Parliament on July 19.

In preparation for independence the people of Jamaica chose a new government in general elections of April 10. About 72% of the electorate went to the polls and turned out the ruling People's National Party of Prime Minister Norman W. Manley in favor of the Jamaican Labour Party headed by Sir Alexander Bustamante. The popular vote was very close; Labour won 49.7% of the ballots, and the People's National Party, 48.9%. As his party received a majority of 26 seats in the 45-member House, Bustamante became prime minister and formed a Labour cabinet which took office on April 24.

Jamaica was admitted to the United Nations on September 18.

JAMMU AND KASHMIR. See KASHMIR.

JAPAN

A constitutional monarchy consisting of the four main islands of Hokkaido, Honshu, Shikoku, and Kyushu and of more than 3,000 smaller islands, Japan has a total area of 142,726 square miles. For administrative purposes, it is divided into 46 prefectures, each of which elects its own governor.

Population.—Japan's population totaled 93,418,501 at the Oct. 1, 1960, census and was estimated at 94,870,000 on June 1, 1962. The population density is 665 persons per square mile. The birth rate in 1961 reached a record low of 16.9 per 1,000 (17.2 in 1960), while the death rate was 7.4 per 1,000 (7.6 in 1960).

On Sept. 1, 1962, the population of Greater Tokyo was estimated at 10,172,877. The estimated populations of other major cities in June 1962 were as follows: Osaka, 3,143,255; Nagoya, 1,687,156; Yokohama, 1,492,635; Kyoto, 1,305,215; and Kobe, 1,160,544. As of July 31, 1962, there were 568,996 registered Koreans and 46,858 Chinese in Japan.

Government.—Japan is a constitutional monarchy, the powers of Emperor Hirohito being restricted to ceremonial functions. Executive power rests in the hands of a cabinet whose prime minister is chosen by the national Diet or Parliament. The Diet is divided into a lower house, the House of Representatives, whose 467 members are elected every 4 years unless the Diet has previously been dissolved; and an upper house, the House of Councilors, representing both national and prefecturewide constituencies, half of whose 250 members are elected every 3 years for 6-year terms. Lower house elections were held on Nov. 20, 1960, and upper house elections on July 1, 1962.

Defense.—Legislation enacted in 1962 raised the total authorized strength of Japan's self-defense forces from 268,333 to 273,578. Armed forces strengths in September 1962 were as follows: ground self-defense force, 156,917 men and 276 aircraft; maritime self-defense force, 36,009 men, 477 ships (127,022 tons), and 228 aircraft; and air self-defense force, 40,434 men and 1,125 planes. The defense budget for the fiscal year ending March 31, 1963, totaled 205.8 billion yen (U.S.$1 equals 360 yen), or 8.5% of the national budget. A second defense buildup program for 1962–66, which was approved by the National Defense Council on July 18, 1961, calls for 180,000 men in the ground forces, 143,000 tons of ships, and 1,030 aircraft by 1966.

Hayato Ikeda, prime minister since July 1960, was born in Yoshina, Hiroshima Prefecture, on Dec. 3, 1899. After graduating from Kyoto Imperial University in 1925, he entered the civil service in the Ministry of Finance. By 1945 he was director of the tax bureau of the ministry, and in 1947–48 served as vice minister of finance. Elected to the House of Representatives in 1949, he joined Prime Minister Shigeru Yoshida's cabinet, and while minister of finance (1949–52) was responsible for anti-inflationary measures that speeded Japan's postwar recovery. Opposition to the government's austerity program prevented his reappointment as finance minister in October 1952 and effected his removal from the post of trade minister a month later, but Ikeda subsequently held cabinet rank in both positions (finance, 1956–57; trade, 1959–60) and as minister without portfolio (1958). He succeeded outgoing Prime Minister Nobusuke Kishi as head of the Liberal-Democratic Party on July 14, 1960, and five days later was installed as prime minister.

Education.—Compulsory education requirements stipulate six years of elementary school and three years of junior high school; there is almost universal literacy. As of May 1, 1962, there were 11,056,915 students in 26,615 elementary schools, 7,328,344 students in 12,647 junior high schools, and 3,281,474 students in 3,711 high schools. There were 670,192 students in 250 colleges and universities as of May 1, 1961.

Religion.—Shintō and Buddhism are the dominant religions in Japan, many Japanese believing in both faiths. As of Dec. 31, 1960, there were 78,470,338 Shintoists, 54,930,739 Buddhists, 669,225 Christians, and more than 4,000,000 believers in other religions.

Transportation and Communications.—The railway network as of Sept. 1, 1962, included 12,820 miles of National Railway Corporation lines (16% electrified) and 4,629 miles of private lines. As of March 31, 1962, there were 607,950 miles of roads, of which 18,639 miles were paved. Registered motor vehicles included 1,106,066 motorcycles, 1,634,543 trucks, 676,999 passenger cars, and 69,660 buses in August 1962.

Japanese airlines carried 2,050,107 domestic and 150,547 international passengers in 1961. (See also AERONAUTICS.) As of December 1961, the merchant fleet consisted of 28,509 vessels totaling 9,992,871 gross tons.

There were 6,345,000 telephones in March 1962. As of July 1962, there were 11,222,802 television sets, served by 252 stations; and 17,716,987 radio sets, served by 390 stations. Newspaper circulation in March 1962 was estimated at 39,000,000.

Economic Conditions.—Despite government measures, introduced gradually beginning in mid-1961, to slow down Japan's unusually high rate of economic growth in order to relieve pressures on the balance of payments, there was no slackening in

Princess Margaret and her husband, Lord Snowdon, stop in Kingston while attending Jamaica's independence ceremonies, August 6–7. In back, at left, is Prime Minister Bustamante.

LONDON DAILY EXPRESS

industrial production throughout 1961 and the first quarter of 1962. The index of industrial production (1955 = 100), which averaged 273.5 in 1961, reached a new peak of 325.8 in March 1962. Some tendency toward leveling off was indicated in the second quarter of 1962, however, and in July the index stood at 295.1. The gross national product for the fiscal year 1961–62 totaled 17,420 billion yen, or 18.9% higher in nominal terms and slightly less than 13% in real terms than in 1960–61. There were 47,060,000 employed and only 370,000 classified as totally unemployed in June 1962. The wholesale price index (1952 = 100) declined slightly after a high of 106.9 reached in September 1961, and stood at 104.0 in June 1962; the consumer price index (1960 = 100) continued to rise, however, from 105.0 in July 1961 to 113.2 in July 1962. Currency in circulation in July 1962 totaled 1,370 billion yen, as compared with 1,178 billion a year earlier.

The national budget for the fiscal year 1962–63 totaled 2,426.8 billion yen, or 15% more than the revised budget for 1961–62. Major increases were made in national debt reduction (70%), social insurance (16%), and defense (13%). A supplementary budget approved in December 1962 totaled 54 billion yen, chiefly to provide for disaster relief and salary increases for government workers.

During 1962, Japan received a standby credit of $300 million from the International Monetary Fund and credits of $68.6 million from the Export-Import Bank of Washington. Gold and foreign exchange reserves rose from $1,486 million on Dec. 31, 1961, to $1,561 million on March 31, 1962, and by September 30 had reached $1,720 million.

Production.—Production continued to increase in most Japanese industries during 1961 and the first half of 1962. Electric power output in 1961 totaled 112,794 million kw.-hr., as compared with 97,829 million in 1960; of this total, slightly over 50% was produced in hydroelectric plants. Coal production continued to rise, from 51.1 million metric tons in 1960 to 54.5 million in 1961; production for the first half of 1962 totaled 29.1 million tons. Refined petroleum production continued to expand, with a new high of 37,220,000 kiloliters attained in 1961; 21,794,000 kiloliters were produced in the first half of 1962.

The output of ordinary hot rolled steel for the first half of 1962 aggregated 10,030,000 metric tons, as compared with annual totals of 15,347,000 tons for 1960 and 19,586,000 tons for 1961. Ship launchings increased slightly, from 1,731,656 gross tons in 1960 to 1,835,000 tons in 1961. Production of other goods in the first half of 1962, with figures for the full year 1961 in parentheses, was as follows: cotton yarn, 246,390 metric tons (558,640); cotton fabrics, 1,598 million square meters (3,383 million); rayon staple fabrics, 413 million square meters (981 million); and cement, 13,643,000 tons (24,632,000).

Brown rice production declined from the 1960 high of 12,858,000 metric tons to 12,419,000 tons in 1961, but another bumper crop of about 13,004,000 tons was forecast for 1962. The 1962 wheat crop totaled 1,629,000 metric tons, as compared with 1,781,000 tons in 1961. The output of common barley was 1,014,000 metric tons (1,127,000 in 1961); that of naked barley, 703,000 tons (849,000 in 1961). In 1961, 81,392 metric tons of tea and 18,678 metric tons of raw silk were produced. The 1961 record fish catch (excluding whales) totaled 6,710,500 metric tons, or 8.4% over 1960.

Foreign Trade.—Both exports and imports rose in 1961 and the first half of 1962, although by the second quarter of 1962 imports showed a tendency to hold steady. Exports increased from $4,055 million in 1960 to $4,236 million in 1961, and imports from $4,491 million to $5,810 million. Special dollar receipts derived from the spending of United States forces and procurement in Japan by the Agency for International Development amounted to $439 million in 1961. In the first half of 1962 exports totaled $2,224 million ($1,962 million in the first half of 1961), and imports $2,955 million ($2,760 million).

The principal exports (in millions) for the first half of 1962 (figures for the full year 1961 in parentheses) were iron and steel products, $229.0 ($380.0); cotton fabrics, $158.3 ($347.7); fish and fish preparations, $112.1 ($162.7); ships, $96.3 ($278.4); clothing, $90.7 ($191.1); chemicals and drugs, $131.6 ($188.7); and fabricated metal products, $82.7 ($158.7). Major imports (in millions) included petroleum, $411.3 ($722.0); raw cotton, $205.8 ($530.0); machinery, $382.6 ($599.2); wool, $168.3 ($344.6); iron ore, $162.1 ($301.9); chemicals and drugs, $157.0 ($336.0); and wood, $152.0 ($260.4).

Exports to the United States, Japan's principal trading partner, decreased slightly, to $1,066.9 million in 1961, but began to rise again in the first half of 1962, to $636.4 million, as compared with $450.8 million in the same period of the previous year. On the other hand, imports, which had increased to $2,095.8 million in 1961, began to fall off in the first half of 1962, to $1,007.0 million ($1,018.0 million in the first half of 1961). Japan's other leading customers (in millions) in 1961, with figures for January–June 1962 in parentheses, were Indonesia, $154.2 ($59.1); Hong Kong, $153.5 ($89.7); Thailand, $133.9 ($70.9); Malaya and Singapore, $132.7 ($63.5); the Philippines, $128.2 ($61.3); South Korea, $125.9 ($57.4); Canada, $116.6 ($64.0); and the United Kingdom, $114.7 ($83.3). Other principal sources of imports were Australia, $451.8 ($229.1); Saudi Arabia and Kuwait, $368.0 ($207.7); Canada, $265.8 ($132.2); Malaya and Singapore, $224.1 (108.4); West Germany, $193.2 ($109.9); the Philippines, $156.0 ($87.9); the USSR, $145.4 ($67.7); and the United Kingdom, $137.1 ($76.8).

Domestic Affairs, 1962. *Political Developments.*—The political scene remained calm in 1962, as Japan concentrated its attention on problems of economic adjustment and on its increasingly complex international relations. Reconvening on January 17 following the customary year-end recess, the regular session of the Diet passed a record-high budget on March 31, after which deliberations focused on the government's request for approval of agreements reached with the United States in settlement of postwar aid to Japan (GARIOA) and with Thailand in repayment of World War II special yen accounts (see below, *Foreign Affairs*). Although the opposition attacked both agreements, threats of mass demonstrations failed to materialize and, except for a brief Socialist Party (JSP) boycott of proceedings, debate was orderly. Both agreements were passed on May 4, but implementing legislation for the GARIOA settlement was sacrificed in the upper house in order to overcome JSP opposition to passage, just before the session closed on May 7, of a bill providing for minor revision of election procedures.

Other important legislation enacted during the session included bills implementing the agricultural standards law adopted in 1961 and increasing the authorized strength of the defense establishment. Seeking to avoid a major clash with the opposition, the government abandoned efforts to pass an anti-political violence bill.

(*Above*) Attorney General Robert Kennedy debates with Japanese student at Waseda University on February 6, on his tour of the country. (*Right*) Members of the Zengakuren student federation demonstrate in front of United States embassy on April 27, protesting resumption of nuclear tests.

WIDE WORLD

The triennial election of half the members of the upper house (125 plus 2 vacancies) was held on July 1. Following a relatively quiet campaign in which interest centered in economic issues, election day brought to the polls a near-record total of 68.2% of the eligible voters. Although the results showed a decline in the conservative share of the total popular vote to 47.2% (52.0% in 1959) and a rise in the combined left to 44.8% (37.4%), the Liberal-Democratic Party (LDP) was able to increase its upper-house strength by 5 seats, with the JSP gaining only 1, while the Democratic Socialist Party (DSP) lost 5.

Prime Minister Hayato Ikeda was reelected LDP president at the party's convention on July 14. The intensification of intraparty rivalries, however, was reflected in the fourth reorganization of his administration (July 18), when all but one of the major factional leaders remained outside the cabinet.

As the extraordinary Diet session (August 4–September 2) opened, party strengths were as follows:

Party	House of Representatives	House of Councilors
Liberal-Democrats	295	142
Socialists	143	66
Democratic Socialists	15	11
Soka Gakkai	..	15
Doshikai	..	7
Communists	3	4
Minor party and independents	2	5
Vacancies	9	...
Total	467	250

During the session the only major item of business was the GARIOA implementing legislation, which was passed on September 1 with only perfunctory Socialist opposition. Although a second extraordinary session, from December 8 to 22, was marred by the JSP's resort to obstructionist tactics in the lower house, the government obtained passage of a supplementary budget and key bills relating to its plans for rationalizing the coal industry.

Within the JSP, the more moderate trend evident in 1961 was strengthened after its convention on January 20–22, when Jotaro Kawakami and Saburo Eda were reelected chairman and secretary general, respectively. Throughout 1962 the party emphasized parliamentary action in an effort to develop a broader base of popular support. Following an open clash between JSP and Communist delegates at the Eighth World Convention Against Nuclear Weapons, held in Tokyo on August 4–6, in which the Communists refused to condemn Soviet nuclear tests, the JSP became increasingly critical of the Japanese Communist Party (JCP) and refused to participate in joint "peace campaigns." The JSP foreign policy platform remained unchanged, however, and in addition to demanding abrogation of the United States–Japan Treaty of Mutual Cooperation and Security and closer relations with the Communist bloc, the party agreed in October to cooperate with the JCP in opposing negotiations for the normalization of relations with South Korea. At a JSP convention held on November 27–29, Eda was replaced as secretary general by Tomomi Narita, also a moderate.

The DSP, at its annual convention on January 25–27, adopted a platform emphasizing welfare state goals and recognizing the necessity for minimal self-defense measures, although opposing rearmament of Japan. In view of the necessity for maintaining unity before the upper house election, there was no challenge to the reelection of Suehiro Nishio and Eki Sone as chairman and secretary general, respectively. Strong demands for a change in leadership following the party's defeat in the election, however, prompted the party to advance its annual convention to October 15–17, when Nishio was reelected chairman, but Eiichi Nishimura was chosen to replace Sone.

There were no major demonstrations or acts of political violence during 1962. The tenth anniversary of the coming into force of the Japanese Peace Treaty was marked on April 28 by quiet ceremonies in which government spokesmen emphasized Japan's postwar recovery and progress under conservative leadership. Although sentiment in favor of a total prohibition of nuclear tests remained strong, Japanese reactions on this sensitive issue reflected recognition that the Soviet Union had taken the initiative in breaking the moratorium and had continued to block an effective international test ban agreement by its refusal to accept minimal measures for inspection. Demonstrations against the resumption of atmospheric testing by the United States therefore were relatively restrained. Perhaps reflecting a growing sense of national pride, there was some improvement in public attitudes toward Japan's own defense establishment. Thus, despite organized left-wing opposition, equipment procured from the United States for Japan's first surface-to-air missile battalion was unloaded and moved to installation sites in September without serious incident. The year 1962 closed on a more turbulent note, however, as strikes by coal

miners and the largest mass demonstrations in Tokyo since 1960 were staged late in December by the JSP and organized labor in an unsuccessful effort to force amendment of the government's rationalization plan for the coal industry.

Communism.—The JCP continued efforts to increase its membership, which reached an estimated 87,000 to 90,000 in 1962, augmented by a Democratic Youth League of about 72,000, of whom approximately one third were JCP members. In the upper house election the JCP made its strongest showing since 1950, polling approximately 4.8% of the total vote to elect 1 candidate from the prefectural constituencies (Party Chairman Sanzo Nozaka) and 2 in the national constituencies, raising its total to 4.

Labor.—As of June 30, 1961, there were 8,359,876 organized workers in Japan, of whom 3,968,123 belonged to Sohyo (General Council of Japanese Trade Unions) and 1,107,867 to Zenro (Japanese Trade Union Council). The National Council of Labor Federations (Domei Kaigi) was inaugurated on April 26, 1962, as a liaison body of right-wing organizations, including Zenro. Except for a two-week shipping strike, ending on May 10 with the granting of a 48-hour week, and coal mine work stoppages in December, the labor scene remained relatively quiet. Negotiated settlements during the spring brought average wage increases of 2,340 yen to public employees and 2,700 yen to workers in private industry.

Foreign Affairs, 1962. *United States.*—An agreement providing for repayment of $490 million in final settlement of United States postwar aid to Japan (GARIOA) was signed on January 9. In accompanying notes the United States expressed its intent, subject to congressional action, to utilize a major portion of this sum for economic assistance to underdeveloped countries and to consult with Japan on the economic development of eastern Asia. It was also agreed that $25 million would be repaid in yen for use in promoting educational and cultural exchange between Japan and the United States.

In accordance with the agreement reached by President John F. Kennedy and Prime Minister Ikeda during the previous year, the first United States–Japan Conference on Cultural and Educational Interchange was held in Tokyo on January 25–31. A conference met in Tokyo on October 21–23 to discuss implementation of recommendations made to both governments by the first meeting of the United States–Japan Committee on Scientific Cooperation (Dec. 13–15, 1961), and the Joint Committee on Trade and Economic Affairs held its second meeting in Washington on December 3–5. The development of closer, cooperative relations between Japan and the United States was further strengthened through the Joint Security Consultative Committee, provided for under the United States–Japan security treaty, which met on August 1, and through cooperative planning in providing increased economic assistance to the Ryukyu Islands.

As a symbol of good fortune, Prime Minister Ikeda of Japan paints an eye on a statue of Dharma, a Buddhist sage, as his Liberal-Democratic Party gains in elections on July 1.

WIDE WORLD

During his visit to Japan on February 4–10, Attorney General Robert F. Kennedy met with a broad cross section of the Japanese people as well as with leaders of the government and major political parties. His willingness to engage in a frank exchange of views with all groups made a striking impression on the Japanese press and public, and his visit met with an enthusiastic reception. Leftist efforts to muster opposition to the visit either failed or backfired, as was the case when a vocal pro-Communist minority disrupted the attorney general's meeting with the student body of Waseda University.

USSR.—Japan's relations with the Soviet Union in 1962 were marked by heightened interest in the expansion of trade. The possibility of Japanese participation in the development of Siberia was emphasized by an industrial mission headed by Vice Premier Pavel I. Abroskin, which visited Japan in July. A Japanese industrial mission visiting the USSR in August concluded a $96 million export contract for 12 tankers, 5 freighters, and a number of auxiliary vessels and an eight-year contract for the Japanese purchase of lumber, to be balanced by the sale of capital and consumer goods for use in Siberia. Soviet-Japanese relations continued to be disturbed by the northern waters fisheries problem, however, and under a new agreement concluded in Moscow on May 9, Japanese salmon fishing in the area regulated by Japan's convention with the USSR was further limited.

Communist China.—Japanese interest in trade with Communist China was renewed in 1962 by the visit to Peking of a group of 5 LDP Diet members headed by Kenzo Matsumura (September 12–25), followed by a 34-man economic mission headed by Tatsunosuke Tacasaki. The latter mission on November 9 concluded a five-year agreement providing for an average annual trade exchange totaling about $100 million. Immediate realization of this level is unlikely, however, since Communist China has few commodities for which there is a large demand in Japan, and since the Japanese steel and fertilizer industries are reluctant to risk free world markets for trade with the Communist mainland. Although willing to explore trade possibilities, the Japanese government continued to avoid any move in the direction of political rapprochement with Communist China.

South Korea.—Foreign Minister Zentaro Kosaka met with South Korean Foreign Minister Choi Duk Shin on March 12–17, 1962, in an effort to break the long-deadlocked negotiations on normalizing relations with the Republic of Korea. Despite the failure of this effort, substantive Japanese-Korean discussions were reopened in Tokyo on August 21. By October, some progress had been made on the difficult problem of settling Korea's financial claims against Japan, but negotiation of other outstanding issues had only just begun, and final agreement was not expected before the spring of 1963.

A top-level Japanese economic mission visited South Korea on September 17–22. It was recognized on both sides, however, that a significant expansion of economic relations must await normalization of diplomatic relations.

Other Countries.—An agreement with Thailand, under which Japan agreed to pay $26.8 million in settlement of a long-standing dispute over

redemption of Thai World War II special yen accounts was signed in Bangkok on January 31. Foreign Minister Masayoshi Ohira, following his attendance at the opening of the 17th session of the UN General Assembly and a meeting in New York with Secretary of State Dean Rusk, visited western Europe (September 24–October 7) for general discussions with governmental leaders in London, Paris, Rome, and Bonn. On November 5–24, Prime Minister Ikeda made his first official visit to western Europe, for discussions with governmental leaders centering chiefly on Japan's relations with the European Economic Community.

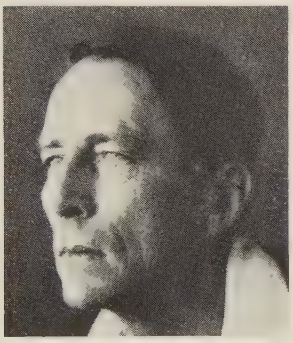
JEFFERS, (John) Robinson

U.S. poet: b. Allegheny (now part of Pittsburgh), Pa., Jan. 10, 1887; d. Carmel, Calif., Jan. 20, 1962.

Jeffers was a tragic poet, for whom pain, sorrow, and despair were the inevitable lot of evanescent humanity. Even the poet, he wrote, "builds



Robinson Jeffers (1887–1962)

UPI

his monument mockingly." Echoing the harsh fatalism of Greek tragedy and the stern doom of Old Testament prophecy, Jeffers was, according to Louis Untermeyer, a poet of "uncompromising negation" who perceived man's nobility, if any, in "his stoical acceptance of suffering and continual defeat." Critics differ widely in regard to both Jeffers' philosophy and his poetic technique. For some he was "Homeric," "vastly important," "magnificent"; for others, "loose, turgid, and careless," "limited," and "self conscious." Whatever the critical appraisal, though, he was, certainly, a major American poet of his generation, who reflected in powerful, somewhat dithyrambic utterances the essentially unhappy and helpless condition of contemporary mankind.

He attended private schools in the United States and abroad, and studied at the Western University of Pennsylvania (now the University of Pittsburgh) and Occidental College, graduating from the latter in 1905. After further study, including three years of medical training at the University of Southern California, he decided to devote his life to poetry—a decision rendered practical by an inheritance that was sufficient to insure his financial independence. His first book, *Flagons and Apples,* was published privately in 1912.

About this time Jeffers moved to Carmel, Calif., where, on a bluff overlooking the sea, he erected, largely with his own hands, his famous stone residence and tower, Tor House. Except for occasional trips, the poet spent the remainder of his life there in relative seclusion; and the Carmel area, with the Pacific Ocean as a backdrop, figured importantly in his work.

His volumes of poetry include *Californians* (1916), *Roan Stallion, Tamar, and Other Poems* (1925), *The Women at Point Sur* (1927), *Dear Judas, and Other Poems* (1929), *Thurso's Landing, and Other Poems* (1932), *Give Your Heart to the Hawks, and Other Poems* (1933), *The Double Axe, and Other Poems* (1948), and *Hungerfield, and Other Poems* (1954). He also wrote several plays, notably *Medea,* a free translation of Euripides' tragedy, which was produced on Broadway in 1947 with Judith Anderson in the title role.

JEWELRY AND WATCHES

The major economic trend in the watch and jewelry industry in 1961–62 was the continuing entry of low-margin retailers into the watch and jewelry field. One example was the opening of several diamond departments in Woolworth stores in some of the largest metropolitan areas. There was also a trend for discount houses with jewelry and watch departments to operate more on the order of department stores, and for department stores to adopt discount house techniques.

Despite a bearish stock market through most of 1962, independent retail jewelers in the United States reported better sales results at midyear than in 1961, and several manufacturers of fine watches reported gross sales 10 to 20% higher than in 1961. Merchandise sales at retail jewelry stores and department store jewelry counters in 1962 were expected to remain in the vicinity of $2 billion. The 1961 Annual Survey of Manufactures reported that the value of shipments of watches and clocks in 1961 was $391,511,000.

Technical improvements were reflected in the new Hamilton "505" Electric Watch, a modified version of the "500" with a simpler movement and a more efficient contact system; a new Swiss Ebauches S.A. Caliber with a two-year battery life; an 8/0 Elgin Electric—the smallest and lightest-weight battery-operated watch designed to date; and a Wittnauer Electric Watch.

Bulova in the summer of 1962 placed an Accutron electronic timepiece in the Telstar communication satellite with the purpose of switching off its radio beam in the summer of 1964.

Perhaps the most dramatic technological developments in the jewelry field were the appearance of a machine-faceted diamond which saves carat weight by elimination of the traditional deep girdle, and the development of blended colored gold with multiple colors and excellent color separation.

JOHN XXIII (Angelo Giuseppe Roncalli)

Pope of the Roman Catholic Church: b. Sotto il Monte, Bergamo Province (Lombardy), Italy, Nov. 25, 1881.

The son of a tenant farmer, Angelo Giuseppe Roncalli was educated at seminaries in Bergamo and Rome, and received a laureate in theology in 1904, the year he was ordained priest. He was secretary to the bishop of Bergamo until World War I, when he served in the medical and chaplain's corps of the Italian Army. In 1921 he was assigned to reorganize the Italian Society for the Propagation of the Faith. Roncalli's long diplomatic career began in 1925, when Pope Pius XI appointed him titular archbishop of Areopolis and sent him to Bulgaria as apostolic visitor. Apostolic delegate to Greece and Turkey from 1935 to 1944, then papal nuncio in France, he was made cardinal and named patriarch of Venice in 1953.

On Oct. 28, 1958, the College of Cardinals elected him 261st supreme pontiff of the Roman Catholic Church,

WIDE WORLD

Pope John XXIII celebrates his 81st birthday on November 25. Later, he blessed the crowds in St. Peter's Square.

to succeed Pope Pius XII; he was crowned John XXIII the following November 4. Almost immediately he enlarged the College of Cardinals to 75, and in 1959 he announced an ecumenical council for 1962. In 1961 he issued the encyclical letter *Mater et Magistra* (1961), urging the prosperous nations to share their wealth with undeveloped areas and stating the Church's position on a wide variety of social questions.

The Second Vatican Ecumenical Council, 21st universal gathering of the Roman Catholic hierarchy and second to be held in St. Peter's Basilica, Rome, opened Oct. 11, 1962. The first session recessed December 8. Some 2,800 church dignitaries attended, including the 39 Eastern Orthodox and Protestant guests or observers received by the pope in special audience on October 13. Addressing the council opening, Pope John called for the "visible unity" of all Christians, but avoided reference to the "return of the separated brethren," a phrase that earlier had offended Protestants and non-Roman Catholics. Although the council was understood to have as its long-range objective the removal of obstacles preventing the union of Roman Catholic and other (especially Eastern Orthodox) Christians, its primary task, the pope made clear, was to effect reforms of a pastoral rather than doctrinal nature—to make "a doctrinal penetration and a formation of consciences, in faithful and perfect conformity with the authentic doctrine, [but] studied and expounded through the methods of research and through the literary forms of modern thought."

The creation of ten new cardinals on March 19 raised the membership of the Sacred College to 90, of whom 87 were publicly known. Papal proclamation of the sainthood of Blessed Martín de Porres on May 6 emphasized the universality of the Church; the saint, a Dominican lay-brother who died in 1639, was a Peruvian mulatto. Three other saints were canonized on December 9.

On October 4, the pope made a 450-mile train trip to the shrines of Loreto and Assisi, marking the first time that a pontiff had traveled by train since 1863. Fears that Pope John might not live to see the end of the Ecumenical Council (Christmas 1963) were expressed after he was taken ill on November 27, but abated somewhat when he resumed holding audiences on December 12.

JOHN BIRCH SOCIETY. See Index entry.

JOHNSON, Lyndon Baines

Vice president of the United States: b. near Stonewall, Texas, Aug. 27, 1908.

After graduating from Southwest Texas State Teachers College in 1930, Johnson taught for two years in Houston's public schools, then went to Washington, D.C., as a member of the staff of Texas Congressman Richard Kleberg. He returned to Texas in 1935 to serve as state director of the National Youth Administration, but resigned in 1937 to run for Congress in a special election, which he won. Except for duty with the U.S. Navy in 1941–42, Johnson served continuously in the House of Representatives until 1948, when he won his seat in the Senate. He was elected majority whip in 1951, and in 1953 became, as minority leader, the youngest Senate party leader in American history. In 1955, after the Democrats gained control of the Senate, he was chosen majority leader. Nominated in 1960 by the Democratic National Convention as the running mate of Sen. John F. Kennedy, he was elected vice president on Nov. 8, 1960, and was inaugurated on Jan. 20, 1961.

The vice president's most important foreign mission of 1962 was a trip to the Mediterranean and Middle East, August 22 to September 7. Conferring with the leaders of Lebanon, Iran, Turkey, Cyprus, Greece, and Italy, he explained the shift of emphasis in United States foreign aid from outright grants to long-term loans for economic development. In Rome, he had a 40-minute audience with Pope John XXIII, and, while in the Italian capital, signed an agreement with Italy on joint space research.

On July 25, Johnson went to Puerto Rico with President Kennedy's letter endorsing the plan of Gov. Luis Muñoz Marín for a plebiscite to decide the future political status of Puerto Rico. Later, he represented the United States government at Jamaican independence ceremonies, August 6–7.

At the height of the pre-election campaign, on October 22, Vice President Johnson canceled all political appearances because of the Cuban crisis.

JORDAN

The Hashemite Kingdom of Jordan, an Arab monarchy in southwestern Asia, is bounded on the north by Syria, on the west by Israel, and on the east and south by Saudi Arabia and the Gulf of 'Aqaba. It has an area of about 37,300 square miles (85% desert) and a population of 1,690,123 (1961 census), of whom 630,725 (as of June 30, 1961) are Palestine refugees. Principal cities are Amman, the capital (1961 census est., 245,000), Nablus, Irbid, Hebron, Ramallah, Jenin, and Jerusalem (Jordanian sector; 1961 census est., 60,000). Arabic is the official language.

Government.—Jordan is a constitutional monarchy of the British type. The hereditary ruler is King Hussein I (b. 1935), who acceded to the throne under a regency in 1952, and assumed rule in 1953. Executive authority is delegated to a cabinet, headed since Jan. 27, 1962, by Premier Wasfi al-Tal. The bicameral legislature or Parliament is composed of a Council of Notables of 30 members (appointed by the king for staggered eight-year terms) and a Council of Representatives of 60 members (elected directly for normal four-year terms by male suffrage). Political parties have been banned since 1957. Jordan is a member of the Arab League and of the United Nations.

Education and Religion.—Educational institutions are operated by the government, by private and religious agencies, and (for Palestine refugees) by the United Nations Relief and Works Agency (UNRWA). Number of schools (with enrollments), 1959–60: 28 preprimary (11,595); 1,088 primary (210,802); 385 secondary (54,475); 10 technical (1,292); 6 teacher-training (624); 2 special (70). Jordan's first university, formerly the Jubeiha Agricultural College (near Amman), was opened in September

1962. Principal religion: Sunnite Islam (about 90% of the population are adherents).

Finance.—Government revenue (1962–63 fiscal year est.): 38,680,000 Jordanian dinars (31,820,000 in 1961–62); expenditure, 39,241,000 dinars (33,420,000). United States grants-in-aid, 1962–63: $37.5 million ($40.5 million in 1961–62); British financial aid, £1.5 million (£2 million). The Jordanian dinar (JD) is valued at £1 or U.S. $2.80. Monetary supply (June 30, 1962): JD32.67 million, of which JD18.97 million was currency. Gold and foreign exchange holdings of the Jordan Currency Board (June 30, 1962): $55.3 million (up $5.3 million from a year earlier).

Transportation and Communications.—Transport networks: state-owned railways, 180 miles; motor roads, 2,800 miles (hard-surfaced, 1,300). Jordan Airways operates scheduled services from Amman and Jerusalem; seven foreign airlines also serve Jordan. Other data for 1960: passenger cars, 6,300; commercial vehicles, 4,600; telephones, 24,400 (1961); radio receivers, 60,000 (1959).

Agriculture.—About 85% of the labor force is engaged in agricultural or pastoral pursuits. Chief crops (metric tons for the 1960–61 crop year): wheat, 44,000; barley, 33,000; olives, 17,000; olive oil, 3,000; chickpeas, 2,000. There were 609,000 head of sheep in 1959–60.

Minerals and Manufactures.—Chief minerals and manufactured products (metric tons, 1961): phosphate rock, 550,000; cement, 223,200; salt, 12,300 (1960); cotton yarn, 3,800 (1959). In 1959 there were 6,667 factories and workshops, which employed 22,000 persons and had a total output valued at JD5.7 million.

Foreign Trade.—Total exports, 1961: JD5,280,000 (JD3,950,000 in 1960); imports, JD41,830,000 (JD42,860,000). The unfavorable trade balance was met in part by donations from foreign governments (JD25,330,000 in 1961) and income from tourism. Principal exports (in million dinars, 1961): phosphates (1.55), olive oil (0.05). Principal imports: cereal grains, textiles, machinery, automobiles, iron and steel, and petroleum products. Chief customers: Syria, Lebanon, Kuwait, Saudi Arabia. Chief suppliers: Great Britain, United States, West Germany, Italy, Syria, Lebanon.

Events, 1962.—After a series of poor harvests caused by successive droughts, agricultural production in the 1961–62 crop year was markedly improved. A five-year economic development plan inaugurated in 1962 placed major emphasis on expanding the productive factors of agriculture, mining, industry, and tourism. Goals for 1967 included a national income of $360 million (up 50% from 1961), exports of $140 million (up 275%), imports of $180 million (up only 30%), and income from tourism of $30 million (up 200%). The total cost of the plan was estimated at $355 million, of which foreign loans and credits would supply at least 45%, and the government and local private capital the remainder.

The 1962–63 state budget allocated JD5,650,000 to the Jordan Development Board to inaugurate the program, and on April 4, 1962, agreement was reached with Kuwait for a loan of JD7,500,000 in support of the development project. On October 17, the Jordan government announced that it was attempting to establish an international consortium, consisting of the United States, Great Britain, West Germany, the World Bank, and possibly Kuwait and Saudi Arabia, to contribute $240 million in development loans and grants over an eight-year period. If this plan materialized, the five-year development plan would be transformed into an eight-year program aimed at achieving an economically self-supporting status for Jordan by 1970.

During 1962 work continued on the second stage of the Yarmuk-Jordan Valley irrigation scheme; plans were made to construct a commercial plant to extract minerals from the Dead Sea; and a contract for the reconstruction of the Hejaz Railway between Damascus, Syria, and Medina, Saudi Arabia, was signed. Under a new agreement reached with the Trans-Arabian Pipeline Company concerning transit rights for petroleum from Saudi Arabia to Saida, Lebanon, Jordan is to receive more than $4 million annually ($850,000 previously) and a lump sum payment of $10 million in settlement of prior claims.

At the eighth session of the Arab League's Economic Council in Cairo on June 6, Jordan, Syria, Kuwait, and the United Arab Republic signed a convention looking toward the creation of an Arab common market. On August 29, King Saud of Saudi Arabia and King Hussein, meeting at Taif in Saudi Arabia, agreed to coordinate the economic policies of their governments and to abolish all restrictions on the free movement of persons and capital between Saudi Arabia and Jordan.

The cabinet of Premier Bahjet Talhouni, which had held office since August 1960, was replaced on January 27 by a 12-man ministry headed by Wasfi al-Tal. It consisted of Western-educated young men, none of whom had previously held cabinet positions and none of whom was a member of Parliament. The new premier was known as an advocate of the so-called "fertile crescent" plan for the political unification of Jordan, Lebanon, Syria, and Iraq, and as an opponent of the policies of President Nasser of the United Arab Republic.

King Hussein stated that the policy of the new government should be to strengthen cooperation with other Arab lands, maintain a clean and honest administration, and strive to make Jordan an economic model among developing countries. The government undertook a housecleaning both in the civil service and in the officer corps of the military establishment.

On September 26 the cabinet decided to dissolve Parliament, which had been elected on Oct. 19, 1961, and to hold new elections within four months. More than 70% of the 450,000 registered voters went to the polls on November 24, and elected 60 members to the Council of Representatives from among 166 candidates (of whom three were unopposed). The cabinet of Premier al-Tal was reinstated in office on December 3 under a mandate from the king to introduce electoral reforms which would give the vote to women and to members of the armed forces.

Relations with Iraq remained strained throughout 1962 as a result of Jordan's support of Kuwait against Iraqi threats of annexation. On January 18, Premier Abdul Karim al-Kassem of Iraq recalled his ambassador from Amman and requested the withdrawal of the Jordanian ambassador in Baghdad in consequence of King Hussein's acceptance of a Kuwaiti ambassador.

Relations with the United Arab Republic were also far from good as a result of Jordan's support of Syria's secession from the UAR in September 1961, and because of Jordan's sympathy for the royalist cause in Yemen following the revolt there in September 1962. King Hussein's autobiography, *Uneasy Lies the Head*, published in London on June 17, charged President Nasser with persistent efforts to destroy both Hussein himself and the Jordanian state. On August 7 it was reported that a plot against King Hussein's life had been foiled during his visit to Rabat, Morocco, and Premier al-Tal charged that the plot was one of a series directed by President Nasser.

Jordan's relations with Saudi Arabia were improved as the two countries were drawn together by common opposition to President Nasser's programs of Arab socialism and pan-Arab nationalism. The aforementioned meeting of the Jordanian and Saudi Arabian sovereigns at Taif in August resulted not only in an agreement for economic cooperation, but in a commitment to settle long-standing frontier disputes and to create a joint command over the armed forces of the two countries.

Diplomatic relations with France, broken in 1956 during the Suez crisis and not resumed be-

cause of the Algerian struggle for independence, were re-established on September 10.

The Jordanian government continued its policy of nonrecognition of Israel and of insistence on Arab rights in Palestine. In his directive to the new ministry on January 27, King Hussein wrote: "We firmly adhere to our full sacred right in Palestine and will never allow anybody or any force to interfere in this right." During an Israeli reprisal raid on Syrian positions on the eastern shore of the Sea of Galilee on the night of March 16–17, an Israeli aircraft dropped two bombs on Jordanian territory. Israel stated that this violation of Jordan's territory had been unintentional, but on March 18, Jordanian Foreign Minister Hazem Nusseibah informed the Syrian ambassador of Jordan's readiness to support Syria in case of an Israeli attack.

An Israeli border patrolman was killed and three others were wounded by Jordanian gunfire on June 14 in the Jerusalem area. On July 4, Israeli and Jordanian soldiers exchanged gunfire for an hour in the same region; two Israeli soldiers and one civilian were killed. At a meeting of the Israeli-Jordanian Mixed Armistice Commission on July 16, agreement was reached to establish a joint border committee to seek ways of preventing future frontier clashes, but on September 30 another Israeli border patrolman was killed by Jordanian gunfire near Baka al Gharbia.

A son was born to King Hussein and his wife, Lady Muna al-Hussein (the former Antoinette Gardiner), on Jan. 30, 1962. The child, named Abdullah after King Hussein's grandfather, the first king of Jordan, was proclaimed crown prince.

KENNEDY—In fluent Spanish, the first lady addresses liberated Cuban prisoners in Miami, Fla., on December 29.

WIDE WORLD

KANSAS

A Central state of the United States, Kansas ranks 14th among the states in area (land, 82,048 square miles; inland water, 216) and 29th in population (2,219,000 on July 1, 1962, a 1.8% increase from the 1960 census figure of 2,178,611). Urban places with populations above 12,000 in 1960:

Arkansas City	14,262	Leavenworth	22,052
Atchison	12,529	Liberal	13,813
Coffeyville	17,382	Manhattan	22,993
Dodge City	13,520	Newton	14,877
El Dorado	12,523	Overland Park (uninc.)	21,110
Emporia	18,190	Parsons	13,929
Great Bend	16,670	Pittsburg	18,678
Hutchinson	37,574	Prairie Village	25,356
Junction City	18,700	Salina	43,202
Kansas City	121,901	Topeka (*capital*)	119,484
Lawrence	32,858	Wichita	254,698

Government.—Chief executive and judicial officers in 1962 included John Anderson, Jr. (Republican), governor, serving a two-year term; Harold H. Chase, lieutenant governor; Paul R. Shanahan, secretary of state; Walter H. Peery, treasurer; Clay E. Hedrick, auditor; William M. Ferguson, attorney general; Adel F. Throckmorton, superintendent of public instruction; and Jay S. Parker, chief justice of the 7-member Supreme Court.

The Kansas Legislature, which convenes annually, comprised 32 Republicans and 8 Democrats in the Senate in 1962 and 82 Republicans and 43 Democrats in the House of Representatives.

Legislation, 1962.—Appropriations totaling $401 million were made by the Kansas Legislature in its budget session, January 9–February 6. Education received substantial increases—a boost of $5 per pupil in emergency school aid (from $20 to $25), and increased assistance to state colleges and universities, including salary raises for most faculty members. The building program at state colleges and universities was increased nearly $3 million, and another $3 million was provided for construction at state mental hospitals.

Most controversial of the bills was one making a token appropriation of $100,000 toward acquiring land for a proposed Prairie National Park in Pottawatomie County. Although the park is advocated by the National Park Service, a strong opposition in the area probably contributed to the status quo situation which prevailed during the balance of 1962.

In the November general elections two proposed constitutional amendments were approved: (1) to permit persons with 45 days of residence in Kansas to vote for president and vice president; and (2) to allow legislators to fix their own pay by statute, instead of having it done by constitutional amendment.

Finance.—In the 1962 fiscal year, operating revenue of $382,626,666 included $245,656,843 from state taxes and $89,459,021 in federal funds. Chief tax yields were the 2½% general sales tax ($79,765,182), and taxes on individual incomes ($27,103,906) and motor fuels ($51,725,362). Spending of $375,899,473 included $124,422,618 for education, $104,306,394 for health, welfare, and safety, and $105,917,398 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 11,185 teachers enrolled 317,849 pupils; secondary schools with 8,300 teachers enrolled 122,627; and private and parochial schools with 1,667 teachers enrolled 48,197. College enrollment totaled 50,181 in 43 institutions, including 14 junior colleges and 29 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $244,225,000, including $177,725,000 for current expenditures ($410 per pupil) and $55 million in capital outlays. Revenue of $261 million was drawn

chiefly from state funds ($47 million) and local districts ($172 million). The state reported teachers' salaries averaging $4,872 (high school, $5,197; elementary, $4,628). Actual spending for higher education (1961 fiscal year) totaled $54,128,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 71,216 persons totaled $46,203,608. This amount included $22,758,997 for the aged and $9,752,280 for dependent children.

Transportation and Communications.—A total of 940 miles of highway construction and reconstruction was completed during the 1962 fiscal year. *Highways and roads* on Dec. 31, 1961, totaled 132,873 miles (84,524 surfaced). These served 1,214,443 *motor vehicles* (as registered on Dec. 31, 1961), including 896,775 automobiles. Operating in the state in 1961 were 14 *railroads* (using 9,056 line miles of track); (1962) 10 regularly scheduled *airlines;* and 214 *airports and airfields.*

Communications media included (1962) 52 AM and 15 FM *radio stations;* 12 VHF *television stations;* 49 daily *newspapers* (circulation, 667,079); and (January 1) 220,400 business and 702,600 residential *telephones.*

Labor Force.—The state's labor force on July 15, 1962, included 139,900 agricultural workers. Nonagricultural wage and salary employees totaled 574,900, compared with 561,700 a year earlier and an average of 558,900 for the full year 1961. Of nonfarm wage and salary employees, 23.5% were in trade, 20.8% in manufacturing, and 19.8% in government services. Unemployment on July 15, 1962, was down to 27,200 from the 39,100 reported a year earlier.

Manufacturing.—Manufacturing engaged 110,672 workers in 1960, including 91,010 in production, and provided a payroll of $599,099,000. Adjusted value added by manufacture totaled $1,229,551,000.

LEADING KANSAS MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1] (in thousands)
Transportation equipment	36,725	$230,166	$363,875
Food and kindred products	21,380	107,865	224,689
Chemicals and products	5,968	34,837	139,977
Petroleum and coal products	4,141	27,094	104,563
Stone, clay, glass products	5,661	31,551	78,192
Nonelectrical machinery	7,096	34,016	66,202
Fabricated metals	6,275	31,854	57,484
Printing and publishing	7,825	31,602	50,789

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—Kansas ranked ninth among the states in the value of its mineral output in 1961, with 2.68% of the national total. Kansas was fourth in output of helium; fifth in natural gas; sixth in petroleum; and seventh in salt. Mineral fuels supplied about 87% of the total value of minerals.

KANSAS MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Cement:		
Portland (376 lb. bbl.)	8,028,000	$ 25,605,000
Masonry (280 lb. bbl.)	379,000	1,156,000
Clays	954,000	1,225,000
Coal	664,000	3,102,000
Helium (cu. ft.)	23,251,000	434,000
Lead (recoverable content of ores)	1,449	298,000
Natural gas (1,000 cu. ft.)	649,083,000	81,135,000
Natural gasoline (1,000 gal.)	132,180	5,790,000
Petroleum (1,000 bbl.)	112,241[1]	324,376,000
Petroleum gases (1,000 gal.)	135,643	5,916,000
Salt, common[2]	914,000	11,409,000
Sand and gravel	11,366,000	7,781,000
Stone[3]	12,328,000	16,411,000
Zinc (recoverable content of ores)	2,446	563,000
Other minerals	...	3,397,000
Total	...	$485,872,000[4]

[1] Preliminary. [2] Excludes salt in brine, value for which is included in "Other minerals." [3] Excludes certain stone, value for which is included in "Other minerals." [4] Excludes duplication of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $1,014,620,000, compared with $1,061,695,000 for the corresponding period of 1961. For the full year 1961 income comprised $683,195,000 from livestock, $658,835,000 from crops, and $83,260,000 in government payments. Principal income sources in 1961 were cattle, $497,858,000; wheat, $485,662,000; and hogs, $70,512,000.

The state's 104,345 farms in 1959 had an acreage of 50,152,791 (20,529,347 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 4,881,000 cattle, 1,302,000 hogs, 880,000 sheep, and 6,951,000 chickens. An average of 130,000 family and 24,000 hired workers engaged in farming during 1961. (See also below, *Events, 1962.*)

KANSAS CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	221	240	180
Barley (1,000 bu.)	11,370	26,040	13,091
Corn for grain (1,000 bu.)	46,935	58,800	66,198
Corn for silage (1,000 tons)	1,503	1,570	2,211
Hay (1,000 tons)	3,447	4,270	4,509
Sorghum grain (1,000 bu.)	78,142	111,680	128,760
Soybeans (1,000 bu.)	5,840	15,114	16,452
Wheat (1,000 bu.)	192,985	273,718	211,171

(Source: U.S. Department of Agriculture.)

Events, 1962.—The November elections emphasized a continued Republican Party reign in Kansas as all of its major state and congressional nominees were decisively swept into office. U.S. Sen. Frank Carlson, running for a third six-year term, led the ticket by defeating his Democratic opponent, K. L. Smith of Wichita, 388,500 to 223,630. James B. Pearson of Prairie Village, who was appointed to the U.S. Senate seat of the late Andrew F. Schoeppel (died January 21), won the remaining four years of the term by defeating Democrat Paul Aylward of Ellsworth, 344,689 to 260,756.

A hard-fought congressional race in the mammoth new 1st District (the western half of Kansas) ended with Rep. Robert Dole of Russell defeating Rep. J. Floyd Breeding, Democrat, of Rolla. The two incumbents were pitted against each other as a result of the redistricting which followed Kansas' loss of one seat.

Gov. John Anderson, Jr., in his bid for a second term, defeated his Democratic opponent, Dale Saffels of Garden City, 341,257 to 291,285.

Republicans also gained 7 seats in the Kansas House of Representatives, making the new lineup 89 Republicans and 36 Democrats. The only state Senate seat up for election was won by a Republican, whose party's 32–8 advantage remained unchanged.

Toward the end of the legislative session the Kansas Supreme Court held the 1961 School Unification Act unconstitutional. In lieu of a special session to rework the act, the Legislature directed its council to study school organization and to make recommendations to the 1963 session.

An 1855 "blue law" forbidding Sunday sales of anything except groceries, drugs, and "necessities" was ruled void in March by the state Supreme Court. Thus the disputed operation of theaters, filling stations, discount stores, chain groceries, and other businesses which had stayed open on Sundays was, in effect, legalized.

Kansas crop production in 1962 was the fourth largest of record, even though the acreage of crops harvested was the smallest since 1939. The 1962 wheat crop, estimated at 211 million bushels, was the 10th largest in history. Sorghum grain production, estimated at 129 million bushels, was the fourth largest crop of record. New record yields per acre were predicted for sorghum grain and silage, corn, and sugar beet crops. The year

was also excellent for livestock production, with numbers at or near record levels.

Although gains in agricultural and livestock production in the past few years have been phenomenal, the number of persons employed in these occupations meanwhile has steadily declined, due to improved farming methods and mechanization. To offset this employment loss, Kansas has been encouraging and developing manufacturing, and the point has been reached where manufacturing payrolls now exceed farm net income and wages.

Former President Eisenhower delivered an address on May 1 at the dedication of the Eisenhower Library in Abilene, scene of his boyhood days. The $3 million stone and marble structure houses the former chief executive's papers, books, and other material.

"Legislation" and "Events" by: NYLE H. MILLER, *Secretary, Kansas State Historical Society.*

KASHMIR

This disputed state (known also as JAMMU AND KASHMIR) occupies 86,024 square miles in the westernmost Himalayas; the population of the India-controlled area was 3,583,585 at the 1961 census. Beyond a cease-fire line established in 1948, Pakistan-controlled Azad (Free) Kashmir occupies about a third of the state. Forces of Communist China crossed the northern border in 1959, and before the October 1962 offensive had occupied 12,000 square miles of Ladakh district (see below, *Events, 1962*).

Srinagar (pop. est., 230,000 in 1959) is the Indian capital; Muzaffarabad is the seat of government in Pakistani-controlled Kashmir.

Indian-Controlled Kashmir.—Under the 1957 constitution, Kashmir has an elected head of state (Yuvraj Karan Singh, reelected for a second 5-year term in 1957); a Legislative Assembly, numbering 77 members in 1961 (23 other seats being in abeyance); and a Legislative Council of 36. The state sends 6 appointed representatives to the House of the People. At elections to the Assembly held in Jammu (Feb. 24, 1962) and in the Kashmir Valley (March 15) the National Conference Party won 68 out of 73 seats, with 33 of its candidates returned unopposed. Resuming office as prime minister, Bakshi Ghulam Mohammed was sworn in on April 6.

Educational facilities in 1959 consisted of the following: primary schools, 2,627 (pupils, 197,000); middle, 328; high, 136; arts and science colleges, 12; technical colleges, 13; other colleges, 4 (and a state university in Srinagar). In 1961, 3,179 students were sent to the United States and other countries. The literacy rate in 1962 was 12%. Kashmir Moslems, according to the 1951 census, amounted to 77% of the population.

Government revenue in 1961–62 was Rs.171.8 million (1 rupee equals U.S.$0.21); expenditure, Rs.138.2 million. State income in 1961 (at 1955–56 prices) was Rs.160 million.

In 1959 there were 278 miles of state roads, and according to a 1961 estimate there were 40 miles of minor roads per 100 square miles.

Areas and production of principal crops, 1960–61: rice, 511,000 acres (228,000 tons); maize (corn), 534,000 (199,000 tons); wheat, 410,000 (87,000 tons); rape and mustard (1959–60), 62,000 (16,000 tons). The manufacture of woolen textiles employs some 300,000 persons; the growing of silkworms, about 60,000. A project was begun in 1962 to increase the 30 sheep-development centers to 300.

Azad (Free) Kashmir.—Khurshid H. Khurshid, who took office in 1959 as president, is assisted by a nominated Council of Ministers. He was reported to have announced (July 15, 1962) that in view of the continuing deadlock between the Pakistani and Indian governments, and the reopening of the Kashmir question at the United Nations, the current budget and other economic data of Azad Kashmir were being withheld from publication. However, numerous development, health, and educational projects were going forward with economic assistance from the Pakistani government.

Events, 1962.—The dispute between India and Pakistan over Kashmir was overshadowed by further Communist Chinese encroachments in the Ladakh district, as well as in the North-East Frontier Agency. The Indian government warned Pakistan against any attempt to negotiate new boundaries with China. In the Ladakh fighting casualties numbered 19 on July 21, and 28 on October 11, according to Chinese reports. On October 20, the Chinese launched a full-scale attack in Ladakh and advanced rapidly despite determined Indian opposition. In the first two days of fighting, there were over 100 casualties, and the Indians lost 11 posts.

A government white paper submitted to the Indian Parliament on August 6 showed that 90 Indian and 75 Chinese notes had been exchanged in the border dispute; deadlock resulted from the Indian government's requirement that Chinese forces be withdrawn from Ladakh as the precondition of a settlement, based on a 1961 report by Chinese and Indian officials.

At the instance of Pakistan in January, the Kashmir issue was again raised in the United Nations, where it was disclosed that President Kennedy had offered the services of Eugene R. Black, president of the World Bank, as mediator. Action by the Security Council was frustrated by a Soviet veto on June 22 after Indian Defense Minister V. K. Krishna Menon had rejected a proposed plebiscite, asserting that Kashmir's accession to India was "full, complete, and final." Talks between India and Pakistan, aimed at settling their dispute over Kashmir, were held on December 27–29 at Rawalpindi, Pakistan.

KENDREW, John Cowdery. See NOBEL PRIZES.

KENNEDY, John Fitzgerald

Thirty-fifth president of the United States: b. Brookline, Mass., May 29, 1917.

Three times in 1962 President Kennedy exerted the powers of his office on a scale seldom seen in peacetime, and three times his antagonists abruptly changed course. In April, the nation's steel industry buckled under federal pressure and canceled a price increase within a few days of the president's angry denunciation of it. In October, as federal marshals and troops were ordered into Oxford, Miss., officials who swore never to admit a Negro to the state university admitted one. And later in October, the Soviet Union, after a confrontation with the United States that brought the world perilously close to nuclear war, agreed to withdraw its offensive weapons from Cuba. The principles underlying these massive displays of force were questioned by many; but in each case the consensus was that for the president to have acted differently, or not at all, would have resulted in graver consequences. His handling of the Cuban crisis, in particular, greatly enhanced his stature and prestige throughout the free world.

Kennedy attended public and private schools in Boston and New York, Choate Preparatory School, and Harvard College, where he was graduated *cum laude* in 1940 as an economics major. Earlier, in 1935–36, he had studied at the London School of Economics, and during his junior year at Harvard had taken a leave to serve in London as secretary to his father, Ambassador Joseph P. Kennedy, Sr. In September 1941, Kennedy was commissioned lieutenant junior grade in the Navy and served as commander of a PT boat in the southwestern Pacific in World War II. He narrowly escaped death in August 1943 when a Japanese destroyer rammed and sank his craft in night action near the Solomon Islands.

After his discharge from the service in March 1945, Kennedy became a special correspondent for International News Service. In the following year he won election to the U.S. House of Representatives from the 11th District of Boston. After twice winning reelection, he successfully ran for the Senate in 1952 against incumbent Henry Cabot Lodge, and was returned to the upper house in 1958. Kennedy's service in the Senate was interrupted for a lengthy period of hospitalization in 1954 when he under-

went two delicate spinal operations to correct a back injury suffered while a college athlete; the disability was complicated by Addison's disease. During the slow convalescence that followed, he wrote *Profiles in Courage* (1956), a best seller and winner of the Pulitzer Prize for biography in 1957. He is the author also of *Why England Slept* (1940) and *The Strategy of Peace* (1960).

As Democratic candidate for president in 1960, he was elected on November 8 by the slight margin of 119,450 votes over Vice President Richard M. Nixon. At his inauguration on Jan. 20, 1961, he thus became the first Roman Catholic to occupy the White House.

In 1961, President Kennedy, with a staff of young, vigorous assistants, drawn largely from academic ranks, set about to execute the "New Frontier" programs of his campaign. Despite his success in establishing such innovations as the Alliance for Progress and the Peace Corps, much of his program was retarded by the economic slump and by a Congress in which conservatives from both parties effectively blocked much legislation. Setbacks in Laos, the abortive invasion of Cuba, and the building of the Berlin wall further complicated the president's first year in office.

Confidence was the keynote of the president's major addresses at the beginning of 1962, as he attempted to reassure the nation of its regained economic momentum and of the favorable international outlook. In his State of the Union message on January 11, he asked for 34 items of politically moderate legislation. Emphasizing the need to meet the competition of the European Common Market, he asked that the expiring Reciprocal Trade Act be replaced with his Trade Expansion Act, which included broad authorization for the president to reduce tariffs (see also TARIFFS). To combat recessions, he asked for authorization to reduce personal income taxes, increase public works spending, and expand unemployment insurance—requests which he reiterated in his first annual Economic Report to Congress on January 22.

The first budget wholly of President Kennedy's making was presented to Congress on January 18. A balanced budget, it was the largest in peacetime history, proposing expenditures of $92.5 billion (more than half for defense) and estimating revenues at $93 billion. The revenues estimate, $3.9 billion over the preceding year's, was based on an assumed upward trend in the economy which failed to materialize. (In November, a $7.8 billion deficit was estimated for the fiscal year.)

Although the president was to praise the 87th Congress in the fall election campaign, his legislative program achieved at best a modest success. The primary item, the Trade Expansion Bill, was enacted, as was a bill to establish a private corporation for the communications satellite network. The federal aid to education bill again failed, however, as did other legislation that received his strong personal recommendation. His attempt to create a cabinet-level Department of Urban Affairs was blocked in both houses, and a bill to provide medical care for the aged under Social Security was killed on July 17.

The full influence of the president's office was manifested when an increase in the price of steel was announced on April 10–11. Imputing "utter contempt for the interest of 185 million Americans" to the steel executives, the angered president asserted that the administration had helped negotiate the industry's new labor contract—concluded a week before—precisely to avert such an increase. As the administration initiated antitrust proceedings and threatened to boycott the Big Steel companies, a complete price rollback was achieved by April 14. (See also LABOR.)

The president's subjugation of the gigantic industry was called "punitive, heavy-handed, and frightening" by Republican leaders and was blamed for the stock market decline in the late spring. Denying an antibusiness attitude, President Kennedy, at Yale University on June 11,

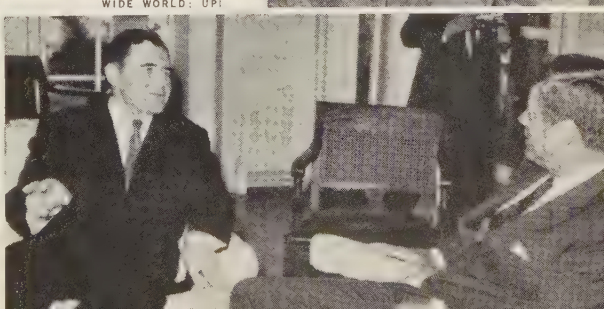
Gromyko assured Kennedy that Soviet missiles in Cuba were purely defensive, a statement the president later branded false.

WIDE WORLD; UPI



called for the cooperation of businessmen in making the economy work at full capacity.

The president's achievements in expanding civil rights were praised by the Southern Regional Council on March 25. Relying primarily on executive and court action, rather than on new legislation, the Kennedy administration had, in the council's words, "built momentum for civil rights into the structure and policies of government."

That momentum proved to be ineluctable during the crisis at the University of Mississippi over the admission of a Negro, James Meredith. President Kennedy spoke by telephone to Gov. Ross Barnett three times on September 29 in an effort to persuade him to comply with the court order to admit Meredith. The next day, in a television address, he appealed to Mississippians and students of the university: ". . . let us preserve both the law and the peace, and then healing those wounds that are within, we can turn to the greater crises that are without, and stand as one people in our pledge to man's freedom." Ultimately, with 26,000 troops within reach of Oxford, Meredith was registered on October 1, as the university became the first desegregated school in the state. (See also EDUCATION; MISSISSIPPI.)

On November 20, with the "stroke of the pen" he had promised during the presidential campaign 22 months earlier, the chief executive signed an executive order prohibiting racial or religious discrimination in certain federally aided housing.

The sixth president in history to risk the prestige of his office by campaigning in an off-year election, President Kennedy delivered his opening speech at Harrisburg, Pa., September 20. Exactly one month later, he canceled all further campaigning by himself and members of his cabinet because of the Cuban crisis.

The president had declared in September that Soviet weapons then in Cuba were defensive, adding: "Were it to be otherwise, the gravest issues would arise." Aerial photographs of offensive missile sites under construction were first showed to him on October 16, and he immediately assembled his advisers. While they secretly considered possible responses, the president maintained his regular schedule. On October 18 he met with Soviet Foreign Minister Gromyko, who was not informed of the reconnaissance, but was read an earlier statement by the president warning of the consequences if Soviet offensive weapons were installed in Cuba. On October 20, when the blockade (the term was later changed to "quarantine" by the president) had been decided on, the president announced from Chicago that he would cancel the rest of his campaign tour because of a head cold.

Tension and speculation mounted when it was announced that the president would speak on a matter of great urgency on October 22. In a radio-television address that day, the president exposed the "urgent transformation of Cuba into an important strategic base" and outlined six "initial" steps, including the naval quarantine of the island to neutralize the threat. Recalling false assurances of the defensive nature of Soviet weapons in Cuba, including those by Gromyko in the preceding week, he said, ". . . it shall be the policy of this nation to regard any nuclear missile launched from Cuba against any nation in the Western Hemisphere as an attack by the Soviet Union on the United States requiring a full retaliatory response on the Soviet Union."

When his bold stand culminated in the Soviet agreement to withdraw its missiles, announced October 28 after an exchange of several notes with Premier Khrushchev, President Kennedy was credited with having achieved a turning point in the cold war. His enormous personal popularity was thought to be the key to the Democratic successes in the November 6 elections.

Two highly publicized controversies involved the president in December. The first resulted from a magazine article on the Cuban confrontation by two correspondents close to the president. Allegations against Adlai Stevenson (q.v.) were assumed to imply presidential disfavor, and a "Dear Adlai" letter written by Kennedy on December 4, affirming confidence in Stevenson, failed to silence rumors of the United Nations ambassador's impending removal from office. The other issue arose from the administration's decision to halt development of the Skybolt missile, which Britain had been relying on for an independent nuclear capability. The subsequent agreement between the president and British Prime Minister Macmillan (q.v.), reached at Nassau on December 18–21, to substitute the submarine-launched Polaris for the air-launched Skybolt, was criticized by proponents of the Skybolt in both countries. (See also MISSILES.)

The controversies, however, did not seriously diminish the president's prestige. Appearing in an informal discussion with representatives of the three major television networks on December 17, he evaluated the current position of the United States by saying, "I think we ought to be rather pleased with ourselves this Christmas." That this view seemed to be shared by a substantial majority of his fellow citizens was a strong endorsement of President Kennedy's second year in office.

E. H. S.

KENNEDY, Robert Francis

Attorney general of the United States: b. Brookline, Mass., Nov. 20, 1925.

Robert Kennedy continued to occupy during 1962 a preeminent position in the administration of his brother, the president, not only as attorney general but as presidential adviser and trusted confidant in many areas outside the field of law enforcement.

The seventh of financier Joseph P. Kennedy's nine children, "Bobby" Kennedy graduated from Milton Academy (Mass.) and, after serving in the Navy in 1944–46, received a B.A. from Harvard University in 1948. He obtained a law degree at the University of Virginia in 1951 and entered government service as an attorney with the Justice Department's criminal division, resigning in 1952 to manage the successful senatorial campaign of his brother, John F. Kennedy (q.v.). The younger Kennedy subsequently served on the staff of the Senate's Permanent Investigating Subcommittee as an assistant counsel (1953), chief counsel for the Democratic minority (1954–55), and chief counsel and staff director (1955–56).

In 1957–59, as chief counsel of the Senate Select Committee on Improper Activities in the Labor or Management Field, headed by Sen. John L. McClellan, Kennedy attracted nationwide attention by his conduct of investigations of labor malpractices, particularly in the International Brotherhood of Teamsters. An account of the hearings is given in Kennedy's book, *The Enemy Within* (1960). During the 1960 presidential campaign, he was his brother's campaign manager.

Robert Kennedy emerged as a world figure in his own right in 1962, as a result of a month-long tour around the world. In many of the countries he and his wife visited, especially Japan and Indonesia, Kennedy reported finding widespread misunderstanding of the United States. Despite a "tremendous reservoir of goodwill toward the United States and the democratic way of life," Kennedy reported that many people have only a Communist picture of life under capitalism. During his world tour, which lasted from February 1

to 28, he spoke out forcefully to bring the position of the United States to the people of the countries he visited, and especially to student and labor groups. (Kennedy described his trip in a book, *Just Friends and Brave Enemies,* published on August 24).

A mid-December trip to Brazil for a conference with President Goulart on that country's spiraling inflation and its possible effect on United States economic aid underlined Robert Kennedy's role as spokesman for the administration.

Civil rights continued to dominate Kennedy's activities as attorney general. Testifying in favor of an administration bill to prevent the use of literacy tests as a device to keep Negroes in the South from voting, he clashed sharply with the chairman of the Senate subcommittee on constitutional rights, Sen. Sam J. Irwin (D, N.C.), on April 10. He played a key role in the crisis which arose in September over the enrollment of a Negro at the University of Mississippi and the subsequent intervention of federal marshals and troops (see EDUCATION; MISSISSIPPI).

KENTUCKY

A South Central state of the United States, Kentucky ranks 37th among the states in area (land, 39,863 square miles; inland water, 532) and 22d in population (3,082,000 on July 1, 1962, a 1.5% increase from the 1960 census figure of 3,038,156). Urban places with populations above 15,000 in 1960:

Ashland	31,283	Lexington	62,810
Bowling Green	28,338	Louisville	390,639
Covington	60,376	Newport	30,070
Frankfort (*capital*)	18,365	Owensboro	42,471
Henderson	16,892	Paducah	34,479
Hopkinsville	19,465	Shively	15,155

Government.—Chief executive and judicial officers in 1962 included Bert T. Combs (Democrat), governor, serving a four-year term; Wilson W. Wyatt, lieutenant governor; Henry H. Carter, secretary of state; Mrs. Thelma Stovall, treasurer; Joseph Schneider, auditor; John B. Breckinridge, attorney general; Wendell P. Butler, superintendent of public instruction; and Brady M. Stewart, chief justice of the 7-member Court of Appeals.

The Kentucky General Assembly, which convenes in even-numbered years, comprised 29 Democrats and 9 Republicans in the Senate in 1962 and 74 Democrats and 26 Republicans in the House of Representatives.

Legislation, 1962.—The General Assembly met in January–March in what was perhaps the quietest session of this body since 1900. There were no burning issues before the lawmakers, and Gov. Bert Combs attempted to make his second legislative session as peaceable as possible. The governor presented a general fund budget calling for the appropriation of $237,995,467 for the fiscal year 1962–63, and $245,340,906 for the year 1963–64. The Democrats controlled 29 of 38 seats in the Senate, and 74 of 100 members in the House. Political sparring in the Assembly was between Democrats and Republicans on the one hand, and the two factions of the Democratic Party on the other. Contributing to the calm of the session was the fact that no new taxes were proposed, and the legislature adhered largely to the administrative budget which was submitted.

The most important single piece of legislation was the adoption of a reorganization bill which departmentalized the functions of state government. Among the new departments and commissions are those relating to state affairs, public safety, the treasury, finance, commerce, public information, libraries, corrections, mental health, public health, children and youth, the aging, and mines and minerals. The departments of health and welfare involved the most marked changes.

Another important piece of legislation concerned the removal of Kentucky's annoying restrictions on public salaries. A constitutional amendment in effect repealed all limitations on salaries. In other action, the number of congressional districts was reduced from eight to seven; an act was passed requiring that all new automobiles be equipped with safety belts; and automobile liability coverage was increased. Local interests were able to push through legislation requiring the use of Kentucky materials by public contractors, but the law left sufficient loopholes to destroy its basic intent. The manslaughter act was expanded to permit charging individuals who caused fatal injury to others with manslaughter in the first degree.

Finance.—In the 1962 fiscal year, revenue of $460,269,155 included $303,995,597 from state taxes and $134,888,212 in federal funds. Chief tax yields were the 3% general sales tax ($94,346,038) and taxes on individual incomes ($36,969,433) and motor fuels ($75,591,029). Spending of $557,284,389 (including General Obligation and Turnpike Authority bond funds not listed as revenue) was principally for education ($160,515,003), health, welfare, and safety ($136,791,065), and highways ($200,478,905).

Education.—In the 1961–62 school year, public elementary schools staffed by 15,599 teachers enrolled 449,989 pupils; junior high schools with 1,013 teachers enrolled 27,643; junior-senior high schools with 7,147 teachers enrolled 170,445; and private and parochial schools with 2,916 teachers enrolled 80,688. College enrollment totaled 49,467 in 10 junior colleges and 24 senior colleges and universities.

Public school operating expenditures in the 1961–62 school year totaled $160,797,097 ($274.93 per pupil) and capital outlays amounted to $36,441,325. Revenue was drawn chiefly from state funds ($90,528,765) and local districts ($64,640,433). Salaries of instructional personnel averaged $4,432 (high school teachers, $4,236; elementary, $3,900). Actual spending for higher education (1961 fiscal year) totaled $40,188,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 152,280 persons totaled $67,649,362. This amount included $35,906,064 for the aged and $23,702,166 for dependent children.

Transportation and Communications.—A total of 64 miles of highway construction was completed in the 1962 fiscal year. *Highways and roads* in January 1962 totaled 69,083 miles (53,196 surfaced). These served 1,236,392 *motor vehicles* (as registered in 1961), including 970,829 automobiles. Operating in the state in 1962 were 22 *railroads* (using 2,226 line miles of track); 9 regularly scheduled *airlines;* and 5 commercial *airports.*

Communications media included (1961–62) 89 AM and 14 FM *radio stations;* 4 VHF and 3 UHF *television stations;* (1961) 26 daily *newspapers* (circulation, 645,350) and 139 other newspapers (343,310); and (Jan. 1, 1962) 214,900 business and 637,300 residential *telephones.*

Labor Force.—The state's labor force in June 1962 included 185,000 agricultural workers. Nonagricultural employment totaled 848,987, compared with 940,545 a year earlier. Wage and salary workers averaged 648,700 during 1961. Of all nonfarm employees, 25% were in manufacturing, 20.4% in trade, and 18.1% in government services. Unemployment in June 1962 was down to 76,709 from the 109,721 reported for the previous June.

LEADING KENTUCKY MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1] (in thousands)
Food and kindred products	25,386	$123,625	$389,345
Chemicals and products	10,693	71,005	241,616
Tobacco products	10,735	49,250	235,270
Electrical machinery	20,191	100,343	232,809
Nonelectrical machinery	12,942	74,058	159,508
Fabricated metals	12,432	63,685	127,520
Apparel and related products	19,738	52,010	96,446
Primary metals	9,228	58,706	94,174
Printing and publishing	8,311	42,638	65,930

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Manufacturing.—Manufacturing engaged 172,714 workers in 1960, including 131,994 in production, and provided a payroll of $816,778,000. Adjusted value added by manufacture totaled $1,968,302,000.

KENTUCKY MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Clays[1]	906,000	$ 2,406,000
Coal	63,032,000	256,158,000
Fluorspar	38,898	1,755,000
Natural gas (1,000 cu. ft.)	70,937,000	17,592,000
Natural gas liquids (1,000 gal.)	...[2]	...[2]
Petroleum (1,000 bbl.)	18,643[3]	55,370,000[3]
Sand and gravel	5,582,000	5,540,000
Stone	17,085,000	23,309,000
Other minerals	...	24,894,000
Total	...	$386,013,000[4]

[1] Excludes certain clays, value of which is included in "Other minerals." [2] Figure withheld to avoid disclosing individual company's confidential data. [3] Preliminary. [4] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Mining.—Kentucky ranked 15th among the states in the value of its mineral output in 1961, with 2.13% of the national total. Mineral output declined 6%. It was second in fluorspar production and third in coal. Except for sand and gravel, employment decreased in all mineral industries.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $305,828,000, compared with $313,130,000 for the corresponding period of 1961. For the full year 1961, income comprised $303,536,000 from livestock, $332,404,000 from crops, and $31,692,000 in government payments. Principal income sources in 1961 were tobacco, $272,460,000; cattle, $106,557,000; wholesale milk, $83,674,000; and hogs, $67,840,000.

The state's 150,986 farms in 1959 had an acreage of 17,030,675 (4,012,962 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 2,242,000 cattle, 1,386,000 hogs, and 6,022,000 chickens. An average of 190,000 family and 46,000 hired workers engaged in farming in 1961.

KENTUCKY CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	315	290	375
Corn for grain (1,000 bu.)	69,837	61,380	64,728
Peaches (1,000 bu.)	218	220	245
Soybeans (1,000 bu.)	2,832	5,025	5,256
Strawberries (1,000 lb.)	8,140	3,680	3,961
Tobacco (1,000 lb.)	398,692	415,349	468,280
Wheat (1,000 bu.)	4,632	4,725	3,406

(Source: U.S. Department of Agriculture.)

Events, 1962.—In the general elections in November, U.S. Sen. Thruston B. Morton, Louisville Republican, was reelected over Lt. Gov. Wilson Wyatt, Democrat, by about 31,000 votes. Issues discussed in the campaign included Wyatt's effectiveness at persuading new industries to locate in Kentucky, his former association with the Americans for Democratic Action, Morton's record as a senator, the medicare issue, and the international crisis. Gov. Bert Combs backed Wyatt, and President Kennedy appeared in Kentucky on two different occasions on behalf of the Democratic candidate, as did former President Truman. Former President Eisenhower appeared in Louisville to support Morton, who also had the backing of the Kentucky medical profession, of business, and of a considerable portion of the middle-class population. All congressional incumbents were reelected except for Democrat Frank W. Burke, who was narrowly defeated in the 3d District by M. Gene Snyder (93,627 to 91,062).

Several problems of 1961 lingered into 1962. There was intense court activity in the Campbell County cases involving the drugging of George Ratterman, reform candidate who was elected county sheriff in 1961, and the general conditions of gambling and law enforcement in Newport. The jury did not reach a conclusion in the case, and the issue remained in suspension. The Carter County school issue was much in the press, with contests between former county Superintendent of Schools Heman McGuire and the Carter County Citizens League for Good Government. In the November school board election the anti-McGuire forces were victorious.

The 100th National Guard Division, called out in 1961 at the height of the Berlin crisis, was brought home and mustered out. President Frank Graves Dickey of the University of Kentucky resigned his post, effective July 1963, to accept a position with the Southern Association of Colleges and Secondary Schools. There was some slight confusion in connection with the integration of Frankfort and Nicholasville public schools, which in the case of Frankfort reached the federal District Court.

On the Ohio River north of Louisville, the U.S. Corps of Engineers completed the high-level Markland Dam, and it was opened to operation. The improvement will greatly facilitate commercial use of the Ohio. Interstate highways in Kentucky were extended during the year, as the state spent all of the funds allotted for these roads. Toll roads were extended into both eastern and western Kentucky, and were to be opened to traffic in 1963.

Western Kentucky faced a brief crisis during the latter part of the summer because of a heavy drought which injured pastures and the hay crop; some emergency relief was necessary. On the whole, however, this was an excellent growing season, and October crop estimates indicated increased agricultural production over that of the previous year.

The eastern Kentucky mining communities, especially those in Letcher and Perry counties, were troubled by labor disputes accompanied by some violence. Unemployment caused by increased mechanization of the mines has created a major social problem in the region.

"Legislation" and "Events" by: THOMAS D. CLARK, *Professor of History, University of Kentucky.*

KENYA

The British crown colony and protectorate of Kenya is situated in equatorial eastern Africa on the Indian Ocean, and extends inland to Victoria and Rudolf lakes. Its area of 224,960 square miles is slightly smaller than that of Texas. The population totals 7,287,000 (mid-1961 est.), including 6,998,000 Africans (mostly Bantu peoples), 178,000 Asians, 66,000 Europeans, and 39,000 Arabs. Kenya Protectorate is a coastal strip of about 2,000 square miles which belongs to and is leased from the sultan of Zanzibar. Principal cities are Nairobi (1961 est. pop., 297,000), the capital; and Mombasa (123,000), chief port in East Africa.

Government.—Pending implementation of a new constitution promulgated in early 1962, the governor (Malcolm MacDonald was appointed to the post on Nov. 17, 1962, succeeding Sir Patrick Muir Renison) is assisted by a Legislative Council of 70 members, including 53 who are directly elected (33 Africans, 10 Europeans, 8 Asians, and 2 Arabs) and 12 so-called national members who are specially elected (4 Africans, 4 Europeans, 3 Asians, and 1 Arab). Party seating in the Legislative Council (following elections of February 1961): Kenya African National Union, 19 directly elected members; Kenya African Democratic Union, 12; New Kenya Party, 4; Kenya Coalition, 3. The leaders of the two leading African parties, Jomo Kenyatta and Ronald Ngala, were designated ministers of state in a 14-member coalition cabinet which was sworn in on April 9–10, 1962. (See below, *Events, 1962.*)

Education and Religion.—The government maintains separate schools for Africans, Asians, Europeans, and Arabs. Christian mission schools make up over four fifths of the total number of schools. About 35% of all school-aged children were enrolled in schools in 1959. Number of schools (with enrollments), 1961: 5,546 African primary (817,758); 53 African secondary (6,442); 42 African teacher-training (3,897); 123 Asian primary (41,226); 36 Asian secondary (11,507); 3 Asian teacher-training (308); 45 European primary (8,213); 14 European secondary (3,069); 11 Arab primary (3,251); 1 Arab secondary (311). The inter-racial Royal College of East Africa at Nairobi had 478 students in 1961. Most of the population are animists; religious minorities include Christians (about 900,000), Muslims, and Hindus.

Finance.—Government revenue, fiscal year 1963 est.: £31,400,000 (£34,840,000 in fiscal year 1962); expenditure, £34,790,000 (£34,262,000). Additional expenditure in fiscal year 1962 for economic development was £9,151,000. British government loans and grants totaled an estimated £20 million in fiscal 1962.

Transportation and Communications.—Transport networks (miles, 1961): railways, 1,020; surfaced highways, 750; other all-weather roads, 3,739; secondary roads, 6,397. The airport at Nairobi is served by the East African Airways Corporation, which provides both internal and ex-

ternal services. Other data for 1960: passenger cars, 64,600; commercial vehicles, 13,100; telephones, 40,954; licensed radio receivers, 57,000.

Agriculture.—Farming and livestock raising are basic to the economy. Principal subsistence crops are maize, wheat, sugar, beans, and peanuts. Chief crops for export (metric tons, 1961): sisal fiber, 58,400 (down 9% from 1960); coffee, 32,700 (up 16%); tea, 9,900 (down 10%); and pyrethrum flowers and extract, 2,400 (down 8%). Livestock products for export (metric tons, 1961): meat, 7,400; butter, 1,900; and hides and skins, 7,300.

Manufactures and Minerals.—Manufacturing, principally of processed foods, building materials, and forest products, is of growing importance to the economy. Chief forest products for export (metric tons, 1961): logs, 15,200 (down 13% from 1960); sawn timber, 178,800 (down 6%); and wattle bark extract, 17,000 (up 18%). Chief minerals produced are gold (12,299 troy ounces in 1961), copper (2,600 long tons), cement (324,000 metric tons), soda ash, and salt. Electricity production (1961): 215 million kw.-hr. (down 2.7% from 1960).

Foreign Trade.—Total exports, 1961: £41.7 million (up 4% from 1960); imports: £68.9 million (down 2%). Chief exports: coffee (valued at £10.6 million in 1961), sisal, tea, pyrethrum, and meat products; chief imports: metal products, machinery, vehicles, chemicals, and fuels. Kenya's principal trading partners are Great Britain, West Germany, the United States, and Japan; trade with other members of the East African Common Market is also of growing importance.

Events, 1962.—Kenyan political leaders attended a constitutional conference held in London from February 14 to April 6, and agreed to form a transitional coalition government pending general elections. The majority Kenya African National Union (KANU) and the minority Kenya African Democratic Union (KADU) each received seven ministerial positions in the new cabinet. Jomo Kenyatta, president of KANU, and Ronald Ngala, head of KADU, were designated ministers of state, and Tom Mboya, general secretary of KANU, was named minister of labor.

The principles of a new constitution proposed by British Colonial Secretary Reginald Maudling were accepted by KANU leaders, representatives of the Kikuyu and other large tribes who want a strongly centralized government, and KADU leaders, members of smaller tribes who desire a federal-type decentralized government. A compromise agreement reached at the conference would establish a strong central government and six regional governments exercising local autonomy in tribal areas. The proposed constitution also provided for a bicameral legislature comprising a lower house to be elected by universal suffrage, and an upper house to consist of representatives from the six new regions.

Despite the agreement in principle concluded at the London conference, the political rivalry and strife between the two major African parties continued. In mid-August a national convention to promote national unity, held in Nairobi, was disrupted by tribal bickering. Both Kenyatta and Ngala failed to attend the meeting, and assailed the political tactics of each other's parties. Kenyatta's KANU party was weakened in mid-August when Luo tribesmen formed a new political movement and threatened to leave the party unless Kikuyu tribesmen ended their alleged practice of taking Mau Mau oaths. Tribal disputes also hindered the work of a British commission attempting to establish boundaries for Kenya's six new regions and the separate district of Nairobi.

Kenya's economy in the first half of 1962 was severely disrupted by more than 100 labor strikes called by unions demanding the rapid Africanization of industry. Minister of Labor Tom Mboya was able to settle most of the strikes, but on June 8 the government issued a statement expressing serious concern about the effect of the work stoppages in delaying the country's economic growth. Economic development was further hampered by an outflow of European capital because of political unrest and uncertainty. The economy continued to suffer from decreased production of coffee and sisal as the result of floods and drought.

Jomo Kenyatta (l.) and Tom Mboya of the Kenya African National Union attend the opening of the Kenya Constitutional Convention in London, February 14, at which an agreement was negotiated on the principles for a new constitution.

WIDE WORLD

The government's program to provide land for Africans by resettling native families in the so-called Scheduled Areas (formerly the White Highlands) was assisted by a British offer to pay for the purchase of 1 million acres of farmland from Europeans over a five-year period, and by a loan of $8.4 million from the World Bank.

W. R. F.

KHRUSHCHEV, Nikita Sergeyevich

Premier of the USSR: b. Kalinovka, Kursk Province, Russia, April 17, 1894.

The aggressive Soviet premier who, since the death of Stalin, has schemed, bullied, and clowned his way in and out of one crisis after another to keep international communism on the move, finally ran into an immovable wall in the fall of 1962 when he attempted to upset the cold war balance of power by secretly introducing offensive weapons into Cuba. Confronted by the might and determination of the United States, he once again remembered Lenin's maxim that a good revolutionist must be ready "to crawl in the mud on your belly," and withdrew from the brink of nuclear war. The Cuban showdown undoubtedly came as a considerable shock which will require a period of grudging strategy readjustment. In the meantime, the resourceful Communist leader assumed, at least within the Iron Curtain, the image of a man of peace who had just "saved" mankind from certain nuclear holocaust.

Born in poverty, the son of a coal miner, Khrushchev joined the Communists in 1918 and started his political career as a minor party worker in the Ukraine. By 1935 he had advanced to leadership of the Moscow Oblast party organization, and from 1938 to 1949 (except for a brief period in 1947) he directed the party in the Ukraine. He became a member of the Presidium (formerly the Political Bureau) of the Supreme Soviet in 1939. A lieutenant general in World War II, he returned as head of the Moscow organization in 1949, and on Sept. 13, 1953, was named first secretary of the Central Committee of the Communist Party, the most powerful political position in the USSR. On March 27, 1958, he was elected premier (chairman of the Council of Ministers) by the Supreme Soviet. He was renamed premier on April 24, 1962.

The Soviet agricultural program on which Khrushchev staked his domestic prestige ironically turned into one of his major administrative problems in early 1962. When he first came to power in 1957, Khrushchev predicted that he would overtake the United States in the production of meat and milk by 1960. But on March 5, 1962, he had to report to the Soviet nation, in a speech before the Communist Party Central Committee, that fulfillment of the 7-year farm plan was "in serious

Soviet Premier Nikita Khrushchev (second from left) is shown with his wife (r.), during a vacation in Yalta with their children and some of their grandchildren.

WIDE WORLD

danger" as a result of agricultural mismanagement. At his suggestion, a new farm plan was adopted which gave party functionaries additional controls over production and planning.

Throughout 1962, however, Khrushchev's principal preoccupation within the Communist realm was with the deteriorating Sino-Soviet relationship. His pledge of Soviet aid on July 2 to Communist China in the event of an assault on the Chinese mainland took on the appearance of an attempt to allay doubts of Sino-Soviet solidarity, but his efforts to reinstate Yugoslavia in the Soviet bloc met with stanch resistance from Peking.

The Sino-Soviet alliance was put to a test when Communist China attacked India, which Khrushchev had tried painstakingly to woo. His attempt to resolve the problem by temporizing brought bitter denunciations from the Chinese. When Peking also assailed the Soviet Union for its withdrawal of missiles from Cuba as "one hundred percent appeasement, a 'Munich' pure and simple," Sino-Soviet relations took a sharp turn for the worse. Bringing the ideological conflict out into the open, Khrushchev's Italian comrades attacked the Chinese directly for the first time in December at the Italian Communist Party congress in Rome, while Khrushchev himself royally entertained visiting Yugoslav President Tito in Moscow.

By the end of 1962, Khrushchev had shown no overwhelming desire to patch up the Sino-Soviet squabble. "There are those," he angrily said of the Chinese before the Supreme Soviet on December 12, "who, like a Buddha, wanted to tell the Soviet Union how to conduct its foreign policy." These "loudmouthed revolutionists" who think the United States is a "paper tiger," warned Khrushchev, had better realize that "the paper tiger has nuclear teeth."

In spite of his problems at home and abroad, Khrushchev, to no one's surprise, was renamed premier on April 24 by the Supreme Soviet. He was also appointed chairman of a newly established commission to draft a new Soviet constitution to replace the 1936 document. During 1962 he also received a host of foreign visitors, including Mali's President Modibo Keita in May; Raúl Castro, brother of the Cuban premier, in August; U.S. Secretary of the Interior Stewart L. Udall in September; and Finland's President Urho Kekkonen in October. He also found time to attend a concert presented in Moscow on May 30 by American jazz musician Benny Goodman, and made state visits to Bulgaria in May and to Rumania in June.

Busy as he was, Khrushchev did not fail to exercise his power as arbiter of Soviet art when he discovered much to his surprise and displeasure that some Soviet artists "don't see our life in the correct light." Walking past a row of abstract paintings in Moscow's Manège Exhibition Hall one day in December, he remarked that "one cannot figure out whether they were painted by a human's hand or smeared by a donkey's tail."

As Berlin remained a bone of contention between East and West, the issue continued to receive its share of Khrushchev's attention in 1962. After conferring in Moscow with East German leader Walter Ulbricht on February 26–27, the Soviet premier let it be known that the conclusion of a German peace treaty would end Western occupation rights in West Berlin. On July 10 he proposed the replacement of Western troops in Berlin by contingents from small nations under United Nations auspices. On August 18, when he was welcoming two Soviet cosmonauts, Maj. Andrian Nikolayev and Lt. Col. Pavel Popovich, who had just returned from record-breaking twin space flights, Khrushchev renewed his threats to conclude a bilateral German peace treaty "unless the West ends its occupation of West Berlin." He reiterated this Soviet position before the Supreme Soviet on December 12, although—significantly, in the wake of the Cuban showdown—he no longer insisted on a deadline. Two weeks later he accused West German Chancellor Adenauer of being the major stumbling block to a settlement of the Berlin issue. On December 31 he again proposed "to replace the NATO flag in West Berlin by the flag of the United Nations."

Earlier in 1962, the world looked on with guarded optimism when Khrushchev seemingly pursued his policy of "peaceful coexistence" in earnest by agreeing on February 21 to President Kennedy's proposal for United States-Soviet cooperation in the exploration of space. But never during the year did he miss an opportunity to rattle his rockets and bombs. On March 16 he announced that the Soviet Union had perfected a "global rocket" capable of evading Western detection or interception and of hitting a target in any part of the world. In announcing Soviet resumption of nuclear tests on May 16 he reminded the United States that in case of a major conflict between the superpowers "the United States would receive the most crushing reply" from Soviet rockets. On July 16 he declared that the Soviet Union had an antimissile missile that could hit "a fly in the sky." In a letter to Chancellor Adenauer on December 27, he warned that West Germany "will burn like a candle in the very first hours" of any major war.

To Robert Frost, the American poet who visited the USSR in October, Khrushchev remarked that the United States was "too liberal to fight." Presumably under this assumption, he had secretly begun a massive missile buildup in Cuba. To cover up the operation, Khrushchev personally assured U.S. Ambassador Foy D. Kohler that Soviet arms shipments to Cuba were purely for defensive purposes. Two days later, in a White House conference with President Kennedy, his foreign minister, Andrei Gromyko, again gave assurances of the weapons' defensive nature, unaware that the president had already received photographic evidence to the contrary.

After President Kennedy had imposed a naval quarantine on Cuba and demanded the dismantling and removal of all offensive weapons from the island, Khrushchev gave his unqualified support to UN Acting Secretary General U Thant's proposal of a two-to-three-week "suspension" of operations by both sides. When this proposal was

politely rejected by Kennedy, Khrushchev offered to withdraw his missiles from Cuba in exchange for the dismantling of United States missile bases in Turkey. During the fateful week of October 23–29 a series of outspoken and at times harsh messages were exchanged between the two world leaders. Realizing that the United States was resolute in its determination, that its stand was unanimously supported by the Organization of American States, and that overwhelming nuclear power was arrayed against him, Khrushchev finally yielded. On October 28 he notified Kennedy that the Soviet government had issued orders for the dismantling of the weapons and their return to the Soviet Union. He further agreed to let United Nations representatives verify the removal operation. (See also CUBA; INTER-AMERICAN AFFAIRS.)

The Cuban withdrawal was not only a source of extreme embarrassment for Khrushchev, but it also served to impose on him a period of cold war policy reappraisal and strategy readjustment. In his 1963 New Year's message, Khrushchev was content to confine his remarks to restatements of known Soviet positions. Absent from his speech were his customary threats and deadlines, and he sounded almost conciliatory. Meanwhile, he had begun to play the role of a "peacemaker" who had just "saved" the world from nuclear destruction.

F. R. H.

KOREA

A peninsula extending from northeastern Asia toward Japan, Korea has an area (including adjacent islands) of 85,286 square miles (South Korea, 38,031; North Korea, 46,768; demilitarized zone, 487). It borders on Siberia for 11 miles and on Manchuria for approximately 800 miles. Its western shore is washed by the Yellow Sea, and its eastern by the Sea of Japan. The mountainous northern half of the country, endowed with richer mineral, timber, and waterpower resources, has most of the heavy industries, mines, and hydroelectric plants. The less rugged south is chiefly agricultural, with light industries.

South Korea's estimated population on June 30, 1962, totaled 26,106,000, and that of Seoul, the capital, 2,911,430. At the 1960 census, Pusan and Taegu had populations of 1,162,614 and 678,277, respectively. At the end of 1960 the population of North Korea was estimated at 10,789,000; and that of its capital, Pyongyang, at 700,000.

SOUTH KOREA

Government.—To bring about the promised Korean independence and receive the surrender of Japanese troops in Korea, Soviet forces occupied the country north of the 38th parallel and United States forces the south in 1945. The perpetuation of this temporary division in the homogeneous nation resulted in a devastating war which began on June 25, 1950, and ended in a stalemate on July 27, 1953, with the signing of the Korean Armistice Agreement.

The 1945 Moscow agreement imposing on Korea a trusteeship for "a period of up to five years" failed to be implemented because of a United States–Soviet deadlock over Korean representation. In 1947 the UN General Assembly created the UN Temporary Commission on Korea to facilitate the establishment of a national government through general elections, but the Soviet Union boycotted the commission and denied it access to North Korea. The commission therefore observed an election of a Constituent Assembly, held on May 10, 1948, in South Korea alone. This legislature adopted a constitution providing for a unicameral National Assembly and, on July 20, elected Dr. Syngman Rhee as president. The formal proclamation of the Republic of Korea on Aug. 15, 1948, terminated United States military government in South Korea. On December 12, the UN General Assembly declared the government of the Republic of Korea a lawful regime in "that part of Korea."

The Rhee regime was overthrown on April 27, 1960, after more than a decade of tyranny. Rhee had changed the constitution in 1952 so as to succeed himself, and again in 1954 to enable himself to run for the presidency for life. Public resentment over the strong-arm methods used in the presidential election of March 15, 1960, culminated in spontaneous demonstrations. When Rhee resigned, he turned over the reins of government to Huh Chung, his newly appointed foreign minister.

On June 15, 1960, the National Assembly amended the constitution to establish a parliamentary system of government with a cabinet responsible to the assembly, to be composed of a House of Representatives and a House of Councillors. As a result of elections held on July 29, in which the Democratic Party was victorious, a government of the Second Republic was established, with Yun Posun taking office as president on August 13, and Chang Myun (John M. Chang) as prime minister on August 19. The formal inauguration of the Second Republic was proclaimed on October 1.

Although the Chang government restored many civil rights, its lack of dynamism in improving the sagging economy and in eliminating corruption and social evils caused popular discontent to mount. Finally, on May 16, 1961, the regime was overthrown by a military coup d'état led by Army Chief of Staff Lt. Gen. Chang Do Young.

The military junta dissolved both houses of the National Assembly and provincial legislatures, outlawed all political parties and labor unions and disbanded many social organizations, imposed stringent censorship on all publications, forbade indoor and outdoor assembly, froze bank deposits, and filled the jails with political prisoners on the usual charges of procommunism. The constitution was set aside, and the country was ruled by decrees. Executive, legislative, and judicial powers were vested in the Supreme Council for National Reconstruction (SCNR). On July 3, Gen. Chung Hee Park (Pak Chung Hi), deputy chairman of the SCNR (under Gen. Chang Do Young) and

(*Left*) Students of Seoul National University clash with police during anti-American riot on June 8. (*Below*) Gen. Chung Hee Park (at right) installs himself as prime minister of the country, June 19. (*Right*) Former Premier John M. Chang (l.) is guarded, September 1, after receiving a life sentence for conspiracy against the regime.

U.P.I.

actual leader of the coup, became head of the SCNR and later promised to return power "completely" to civilian control in 1963. A referendum on a new constitution, providing for a strong president and a weak unicameral National Assembly, was held on December 17. The voters gave their approval to the junta-sponsored document.

Education.—In the 1961–62 school year there were 3,854,779 pupils in 5,264 elementary schools, 723,951 students in 2,449 middle schools, 320,159 students in 981 high schools, and 144,822 students in 81 colleges and universities.

Religion.—There are no accurate statistics on adherents of all faiths, but Confucianism and Buddhism predominate over Chontoism (Chondo-kyo), Christianity, and Tankun-kyo (the religion of Tankun, mythical founder of Korea). The 1962 *Korea Statistical Yearbook* listed 1,140,134 adherents of Buddhism in 2,011 temples, 172,823 followers of Confucianism in 191 temples, 29,691 adherents of Tankun-kyo in 11 churches, and 22,366 followers of Chondo-kyo in 50 churches. Christians included 607,668 Protestants in 5,823 churches and 475,347 Roman Catholics in 826 churches.

Transportation and Communications.—In 1962 there were 16,883 miles of roads, 1,878 miles of railroads in operation, and 29,234 motor vehicles, and, in 1961, 12,213 vessels aggregating 369,014 gross tons. In 1962 a $14 million loan was received from the International Development Association for the purchase of railway cars. Air service is provided by Korean National Airlines and three foreign lines. There were 165,000 radio sets, 30,000 television receivers, and 97,016 telephone subscribers in 1962.

Economic Conditions.—South Korea has been sustained by United States assistance, which from 1945 through June 30, 1962, totaled $5,433.6 million ($3,431.4 million economic and $2,002.2 million military). More than 1,000,000 units of housing are urgently needed, but only 7,189 were constructed in 1961. An estimated 2,000,000 persons are unemployed, and 1,500,000 are underemployed.

Production of staple foods in 1961 included 3,725,000 metric tons of rough rice, 347,000 tons of potatoes, 5,550,000 bushels of wheat, and 47,700,000 bushels of barley. Food imports amounted to $9,174,000, and the fish and shellfish catch totaled 409,700 metric tons.

The general industrial production index (1958 = 100) rose from 125 in 1960 to 132 in 1961. Major textile manufactures in 1961 included, in square yards, cotton, 133,000,000; silk, 3,220,000; rayon, 55,239,000; and wool, 3,933,000. Electric power generation amounted to 1,770.5 million kw.-hr. Production of other commodities, in metric tons, was as follows: cement, 522,832; coal, 5,884,300; iron ore, 504,800; steel, 46,680; tungsten concentrates, 6,303; and salt, 121,746. The gold output was 2,599 kilograms.

In 1961, imports amounted to $300 million (including $197 million financed by foreign aid), and exports to $38.6 million. The money supply rose from the equivalent of 31.2 billion won on Dec. 31, 1961, to 38.3 billion on Sept. 15, 1962. Gold and foreign exchange holdings amounted to $207.0 million on Dec. 31, 1961, and to $186.3 million on July 31, 1962. The hwan, the rate of which had been set at 1,300 to U.S.$1 on Feb. 2, 1961, was replaced, effective June 10, 1962, by the won at 130 to $1. On June 16, the government froze all private accounts of more than $230 and announced plans to channel from 20% to 100% of all deposits (equivalent to $89 million) into the new $2,460 million Five-Year Plan (1962–66). When financial chaos resulted, the government released $17 million on June 30 and all deposits on July 13. Prices were frozen on basic commodities beginning on August 14.

The national budget for 1962 called for 67.5 billion won. In the fiscal year 1962 the United States provided $92.5 million in defense support, $25.2 million through the Development Loan Fund, $7.1 million in development grants, and $281.4 million in direct military aid.

Political Developments, 1962.—The military junta headed by Gen. Chung Hi Park has exerted every effort to cement its position. While continuing to promise a return to civilian government in 1963, it adopted a sweeping Political Activities Purification Law on March 16, 1962, which barred virtually all influential officials of former regimes, as well as other politicians and legislators, from political activity for the next six years. Although this law exempted President Yun Posun, he resigned on March 22, protesting that it "would injure harmony and unity among the people." General Park assumed the presidency two days later and, on June 18, the premiership as well, after Gen. Song Yo Chan (and Finance Minister Chun Byung Kyu) had resigned (June 16) in disagreement over the currency reform. He relinquished the premiership on July 10 to Kim Hyun Chul, finance minister under Syngman Rhee. Meanwhile, Gen. Chang Do Young, whose death sentence on charges of counterrevolutionary conspiracy had been commuted to life imprisonment on March 10, was freed on May 2.

In June, the South Korean Central Intelligence Agency claimed to have uncovered two plots to overthrow the junta and restore civilian rule. The first (announced on June 1), was allegedly led by Kim Sang Don, former Seoul mayor, and Cho Chung So, Democratic Party organization chief, and involved 41 persons. The second (announced on June 16) reportedly involved former Prime Minister Chang Myun. Chang was jailed on August 28 after an army court martial had demanded a life sentence for his alleged donation of $615 toward the plot. (Chang denied any involvement and insisted that the money had been a private gift to a friend for his family.) He was sentenced to a 10-year prison term on September 27, but was released on October 15.

The junta stressed "voluntary cooperation" on the part of the press, but on June 28 it announced a stringent policy reducing the number of newspapers by forced "mergers" and "voluntary closures." It set up strict standards of makeup and editing for the "enlightenment of the masses." Various newsmen were detained on antigovernment charges.

In June, following two incidents in which United States soldiers respectively killed and beat Koreans caught stealing from U.S. Army compounds, there was considerable agitation for a status-of-forces agreement between South Korea and the United States. Students of different colleges demanded "immediate conclusion" of such an agreement and marched on the United States embassy.

The Political and Security Committee of the UN General Assembly, on December 18, passed (65–11, with 26 abstentions) a resolution instructing the UN Commission for the Unification and Rehabilitation of Korea (UNCURK) to continue its efforts to bring about a unified, independent, and democratic Korea. This perfunctory act was approved by the Assembly on December 19.

North Korea

The Democratic People's Republic of Korea was established north of the 38th parallel on Sept. 9, 1948, after elections held independently of the UN Temporary Commission on Korea, and proclaimed itself the government of all Korea. It was headed by Kim Il Sung as premier and Kim Doo Bong as chairman of the Presidium of the Supreme People's Assembly. Kim Il Sung succeeded himself as premier on Sept. 20, 1957, but chairmanship of the Presidium passed to Choi Yong Kun. In the Supreme People's Assembly election of Oct. 8, 1962, 100% of the electorate reportedly voted for 100% of the 383 candidates, and Kim Il Sung and Choi Yong Kun succeeded themselves.

Industrialization and expansion of agriculture seem to be the cardinal aims of the Korean Workers' (Communist) Party and the North Korean regime. The North Koreans boast that their First Five-Year Plan, which began in 1957, was fulfilled in two and one-half years, and that they began a seven-year plan in 1961. Their claims for 1961 production included 4,830,000 metric tons of grain, 591,000 tons of seafood, about 12 million tons of coal, 930,000 tons of iron, 800,000 tons of steel, 2,300,000 tons of cement, 700,000 tons of chemical fertilizers, 190,000,000 meters of textile fabrics, and 10 billion kw.-hr. of electricity.

Just as South Korea is sustained by the United States, so is North Korea supported by the Communist world. The equivalent of $754,350,000 in aid was promised through 1957, including $360 million from China and $250 million from the USSR. A 1959 agreement contemplated Soviet delivery of equipment and materials amounting to nearly 500 million rubles ($125 million at the official rate), to be paid for in Korean goods. It was announced on Nov. 1, 1960, that the Soviet government had exempted North Korea from repayment of 760 million rubles in earlier loans. The Chinese government agreed on Oct. 13, 1960, to grant North Korea a loan of 420 million rubles between 1961 and 1964 to help build up its light industry.

In 1961–62 there were approximately 2,530,000 students in 8,500 schools of all levels, including 184,000 in 92 institutions of higher learning. Education is compulsory for the first seven years. Tuition is free at all levels.

Repatriation Agreement.—Representatives of the Red Cross societies of Japan and North Korea met in Geneva in 1959 to negotiate the problem of voluntary repatriation of Koreans in Japan, and a repatriation agreement was signed in Calcutta on August 13. The emigration program is being carried out under the observation of the International Red Cross Committee.

The first group of repatriates left Japan for North Korea on Dec. 14, 1959, and by Nov. 8, 1962, the total number had reached "some 80,000" (in 100 groups). On the same day the Red Cross societies of North Korea and Japan agreed to extend the repatriation arrangement for another year, to Nov. 12, 1963.

YONGJEUNG KIM,
President, Korean Affairs Institute.

KREISLER, Fritz

Austrian violinist: b. Vienna, Austria, Feb. 2, 1875; d. New York, N.Y., Jan. 29, 1962.

For over 50 years Fritz Kreisler was the symbol of virtuoso violin playing. His artistry, according to Deems Taylor, was "so nearly flawless that it [was] like a pane of glass through which one looks upon beauty." The leading solo violinist of his day, Kreisler was also a composer of note, and his music, light and melodic, holds wide popular appeal. "If the test of music is longevity," Harold C. Schonberg wrote, "Kreisler's music bids fair to be immortal."

Fritz Kreisler was a child prodigy, and his father, a physician and amateur violinist, carefully nurtured his son's exceptional musical talent. The boy attended the Vienna Conservatory—the youngest child to have studied there—and, at the age of ten, won the violin gold medal. He then was sent to the Paris Conservatory, where in 1887 he received his second gold medal, the Premier Grand Prix de Rome. He made his United States debut in 1888, and in 1889 toured that country with Moriz Rosenthal; the famous Polish pianist. Returning to Europe, he temporarily abandoned music for medical studies in Vienna, art training in Paris and Rome, and duty in the Austrian Army.

Resuming his career as a violinist, Kreisler made his debut as a mature musician in Berlin in 1899. He shortly visited the United States again, and there, as well as in Europe, his reputation as a soloist par excellence was quickly and firmly established. He joined the Austrian Army at the beginning of World War I, but was released in 1914 after being wounded on the Eastern Front. He spent the remainder of the war in the United States; however, because of a degree of ill feeling toward him as an enemy alien, he retired from the concert stage for the duration.

Kreisler returned to Europe to live in 1924, although he performed frequently in the United States. Following Nazi Germany's annexation of Austria in 1938, he became a French citizen. He moved permanently to the United States in 1940 and became an American citizen three years later. Although in 1941 he was badly injured and disabled for nine months as a result of being struck by a truck in New York City, he continued his public concert career until his retirement in 1950.

Kreisler's most popular compositions include the salon pieces *Liebesfreud, Liebeslied, Romance, Caprice Viennois,* and *Tambourin Chinois,* as well as the operetta *Apple Blossoms* (1919). An indication of Kreisler's skill as a composer may be found in the fact that a series of compositions ("Classical Manuscripts") which were published and accepted as his editions of works by such classical composers as Couperin, Porpora, and Vivaldi, were in reality his own music.

KUWAIT

An independent desert amirate, Kuwait is situated at the northwest corner of the Persian Gulf between Iraq and Saudi Arabia. Kuwait has an area of about 6,000 square miles and a population of 321,621 (1961 census). More than half the population are Arabs and Indians; there are also about 5,000 Europeans and Americans. Kuwait was a sheikhdom with special treaty arrangements with Great Britain from 1899 until 1961, when the treaty was terminated by mutual consent, and replaced by a treaty of friendship.

Government.—The ruler, Amir Sir Abdallah al-Salim al-Sabbah (acceded in 1950), is absolute in his own right and is chosen by members of the al-Sabbah family. Elections were held on Dec. 30, 1961, for the first Constituent Assembly, which comprised 20 members. On Jan. 1, 1962, the amir decreed a provisional constitution to be in effect until the Constituent Assembly drew up a permanent constitution. On January 17, he appointed the first cabinet of 14 members, 11 of whom were sheikhs of the al-Sabbah family. The Constituent Assembly was opened officially on January 20.

Administratively, Kuwait was divided in 1962 into three governorates: Kuwait, Lahuli, and Ahmadi, each under an al-Sabbah governor responsible to the minister of the interior. Sheikh Abdallah al-Mubarak al-Sabbah, who heads the army and the police, is the deputy ruler.

Finance.—In 1961, Kuwait issued her own currency, the dinar, equal in value to the British pound. The Kuwaiti dinar (KD) is completely covered by a reserve fund, 50% of which must be in gold, and is freely exchangeable for any other currency. For the fiscal year ending March 31, 1963, the Constituent Assembly approved a budget of KD173.1 million ($485 million), of which KD76.5 million was for development projects.

Education.—Education is free for all. There are 109 government schools (with 45,157 pupils), one secondary school (1,400 students), and a technical college. About 80% of the teachers are Egyptians. University buildings planned by a United Nations commission in 1960 have been completed and are occupied by the secondary school, but no opening date has been set for the university. Many students are granted government scholarships for further study abroad.

Economy.—The economy is based entirely on the petroleum industry, and in 1961 Kuwait produced a record 81.4 million tons of oil (80 million in 1960). The original concession was given in 1934 to Gulf Oil Corporation and

British Petroleum Company. Oil was discovered in 1938, but only insignificant amounts were produced until after World War II. Oil revenues increased from about $3 million in 1947 to $56 million in 1952, and to an estimated $475 million in 1962. Offshore concessions were granted to the Royal Dutch Shell Group of Companies in 1960, and the Japanese-owned Arabian Oil Company obtained Kuwait's share of the offshore concession for the Neutral Zone separating Saudi Arabia and Kuwait. The American Independent Oil Company operates Kuwait's share of the Neutral Zone proper, and in 1962 a new agreement was concluded to give Kuwait 57% of the company's profits in the Neutral Zone.

In 1960, the Kuwait National Petroleum Company (KNPO) was organized (60% government owned and 40% privately owned) to participate in all phases of the oil industry from prospecting to final sales. KNPO has the option of acquiring 20% of offshore concessions granted to Shell. Kuwait has an oil reserve estimated at 62 billion barrels; Burgan field alone has over 12 billion, and is the richest oilfield in the world. An average of eight tankers call each day at Mina al-Ahmadi to load petroleum products.

Over one third of Kuwait's total disposable income is in the hands of the government, and more than half of the labor force is in government service. Per capita national income is somewhat more than $3,500, which is above the level in the United States. Kuwait's total exports in 1960 were estimated at $1,000 million; imports, at $250 million.

Events, 1962.—In addition to the new developments in parliamentary government (see above, *Government*), a principal development in 1962 was Kuwait's broad entry into the arena of world finance. She joined the International Monetary Fund, the International Bank for Reconstruction and Development, the International Finance Corporation, and the International Development Association, to which she subscribed $50 million, $66.7 million, $369,000, and $3.36 million, respectively.

Having a gross national product of nearly $900 million, Kuwait has very large capital funds for foreign loans and investment. Excluding the immense wealth of the ruling family, the official state reserves amounted to more than $672 million. The government established in 1962 the Kuwait Fund for the Development of Arab Economy, with a capital of $140 million for long-term, low-interest loans. The first loans, announced in April, were to the Sudanese Railways ($19.6 million at 4% for 15 years) and for Jordan's five-year development plan ($21 million). Kuwait announced on July 23 that it would lend $8.4 million to newly independent Algeria.

It was announced on October 30 that the amir had named his brother, Sheikh Sabbah al-Salim al-Sabbah, as heir to the throne. At that time it was also reported that the cabinet had approved a new constitution, and had made plans to hold a general election.

LABOR—New York Newspaper Guild members picket the *Daily News* on October 1, at beginning of an 8-day strike.

WIDE WORLD

LABOR

The continuing problem of unemployment in the economy generally and reduced employment in key industries such as basic steel combined to make income security a central concern of labor relations in 1962. This concern resulted in a number of contract innovations designed to spread available work or compensate workers for loss of employment opportunities. Federal government programs for retraining unemployed workers gathered momentum during the year and the labor movement reached a decision to promote a short workweek as a remedy for unemployment.

National Labor Policy.—As 1962 began, the President's Council of Economic Advisers presented "guideposts for non-inflationary wage and price behavior." The guideposts, contained in the Economic Report of the president, published in January, were intended as a contribution to a discussion of the question: "How is the public to judge whether a particular wage-price decision is in the national interest." The council suggested as a general guide that the national interest would be served if the rate of wage increases (including fringe benefits) in each industry were equal to the rate of increase in productivity in the economy as a whole. Numerous specific modifications were included so that they might be adapted to the circumstances of particular industries, but the council asserted that the observance of these guideposts would maintain stability of labor costs in the economy and contribute to the objective of price stability.

Secretary of Labor Arthur J. Goldberg, in a speech before the Executive Club in Chicago on February 23, said that the federal government's obligation in collective bargaining "is to unhesitatingly assert and define the national interest [when] it reaches important proportions in any area of our economy," and not merely to mediate immediate issues.

During 1962, as in all recent years, the heavy

pressure of problems arising from automation burdened collective bargaining. These problems became the subject of the first report of the President's Advisory Committee on Labor-Management Policy (established in 1961) which was submitted to President Kennedy on Jan. 11, 1962. The committee's basic propositions were that: (1) automation and technological progress are essential to the welfare of the nation; (2) this progress must be achieved without the sacrifice of human values; and (3) both private and governmental action are essential in dealing with the problem. The committee considered a faster rate of economic growth essential to reducing unemployment, and did not express interest in a shorter workweek as a method of dealing with the problem. In addition, it recommended cooperation between private groups and the government to achieve a higher growth rate in the economy and improve educational facilities. The same kind of cooperation, the committee said, was needed to establish various aids for displaced workers, such as retraining programs which provide for subsistence and transfer payments.

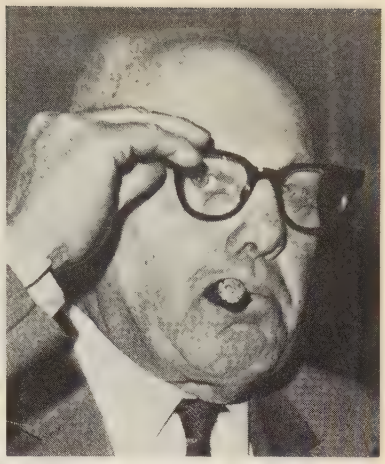
The committee's second report, entitled *Free and Responsible Collective Bargaining and Industrial Peace*, appeared on May 1. Rejecting compulsory arbitration as an unwarranted intrusion by government, the committee nevertheless suggested that collective bargaining would benefit from a greater awareness by labor and management of their joint responsibilities to society. Other proposed changes the report held to be beneficial were willingness to make wider use of various kinds of assistance by third parties and strengthening mediation services on the local, state, and national level.

Collective Bargaining.—Negotiations in the steel industry and their aftermath provided a dramatic illustration of the administration's policy of asserting the national interest. With the steel industry's 116-day strike of 1959 in mind, the administration, acting through Secretary Goldberg, sent telegrams to the parties in February 1962 to urge an "early and non-inflationary settlement." Negotiations began in mid-February, and tentative agreement was achieved on March 28, three months before the old contract expired. Chief negotiators of the agreement, ratified by the union on March 31, were David J. McDonald, president of the United Steelworkers, and R. Conrad Cooper, executive vice president of U.S. Steel and head of the negotiating team which represented 11 major steel producers.

On April 10, Leslie B. Worthington, president of U.S. Steel, announced increases in the price of steel averaging $6 a ton, effective immediately. Worthington justified the increase as necessary to provide funds for plant modernization needed to meet foreign competition. He pointed out that there had been no general increase in the price of steel since 1958. At his news conference the next day, President Kennedy denounced the industry's move as an "irresponsible defiance of the public interest" in view of the recent settlement acclaimed generally as noninflationary.

The day after the president's statement, Inland Steel Company and Kaiser Steel Corporation decided not to raise prices, and Bethlehem Steel Corporation decided to rescind its price increase. U.S. Steel restored prices to their previous level a few hours later, and the remaining steel firms followed suit.

The terms of the new contract evidenced the union's preoccupation with protecting its members' jobs. They suspended the "escalator" clause and left wages unchanged, although the companies agreed to reopen negotiations on wages, pensions, insurance, and certain other terms in 1963. Although the union did not secure its original demand for 13 weeks' sabbatical leave for employees with 20 years' service, a vacation savings plan which provided new retirement and vacation benefits was incorporated in the contract.



AFL-CIO President George Meany tells newsmen on November 12 that he agrees to work out a solution with Walter Reuther regarding their dispute over the selection of a new member of the Executive Council.

UPI

Innovations designed to spread available work also were negotiated by the steelworkers and two large companies in the can industry. The most important feature of the 2-year contracts signed with American Can Company and Continental Can Company on September 30 was the establishment of a sabbatical vacation plan which becomes effective on Jan. 1, 1964. The plan provides a 3-month vacation every 5 years for employees with 15 or more years of service.

In the railroad industry, where a Bureau of Labor Statistics report revealed that employment had declined by more than 40% between 1947 and 1960, the long-standing dispute over work rules continued during 1962. Hopes for a settlement dimmed in February after the five operating brotherhoods rejected recommendations of a 15-member commission appointed by President Dwight D. Eisenhower in 1960 to study the problem. The major recommendations, submitted after more than a year's study, were that: (1) firemen be gradually withdrawn from diesel engines in road freight and yard service (but not those in passenger service); (2) firemen with 10 or more years' service be retained at full job rights until retirement; and (3) firemen with less than 10 years' service who are separated be provided with severance pay and retraining programs.

The commission offered numerous other suggestions designed to give the railroads greater

W. Willard Wirtz (right) became secretary of labor on September 25, succeeding Arthur J. Goldberg (left), who was appointed an associate justice of the U.S. Supreme Court.

U.P.I.

flexibility in the use of their operating employees and expand management rights to introduce technological changes. It also called for a rationalization of the chaotic compensation structure in the railroad industry. Railroad management had reservations about the commission's recommendations, but agreed to accept them as a framework for negotiations. Subsequent failure to make any progress toward a settlement led the railroads to announce plans to put into effect, on August 16, work rule changes based on the commission's report, but this plan was postponed when it became entangled in litigation. Five operating unions asked a federal district court to prevent the railroads' unilateral action, calling it a violation of the Railway Labor Act. Although the court rejected the petition, it issued a temporary injunction against the railroads pending appeal of the case. The unions also spoke of the possibility of a nationwide rail strike if all other efforts failed to dissuade the railroads from instituting the proposed rule changes. The controversy had not been resolved by the end of the year.

In aerospace industry negotiations during 1962, the union security issue overshadowed all others. Although the union shop is common in other manufacturing industries, the United Auto Workers and the International Association of Machinists (which represent most aerospace workers) had not yet been able to obtain it in more than a few firms in the aerospace industry. A breakthrough of sorts was gained by these two unions negotiating jointly at Douglas Aircraft Co. when, on July 16, that company agreed to an agency shop clause in the contract. This clause required that any of the 22,000 union-represented employees who are not members of the union must pay an amount equal to union dues in lieu of membership.

The settlement at Douglas did not lead to agreements at other major aerospace companies, and on July 21, President Kennedy appealed to the parties to continue operating under existing contracts for 60 days. At the same time, the president appointed a three-member board headed by Dr. George W. Taylor to aid the Federal Mediation and Conciliation Service in bringing about a settlement.

"Misery's Got Company."

SANDESON IN THE FORT WAYNE NEWS-SENTINEL

On September 4 the board recommended economic terms generally similar to those in the Douglas agreement, but it urged that the union security issue be resolved through an election among employees, a two thirds majority of those

voting being required to adopt the union shop. The elections held at North American Aviation Co., the Convair Division of General Dynamics, and Ryan Aeronautical Company in October and early November failed to give the union shop majorities large enough for adoption, although about 55% of the workers at Convair and about 60% at the other two companies favored it.

One of the widely discussed agreements of 1962 was the establishment of a 25-hour basic workweek after negotiations in mid-January by Local 3 of the International Brotherhood of Electrical Workers and New York City electrical contractors. (The 9,000 electricians covered by this contract already had a 30-hour basic workweek.) The settlement had, in fact, come after a brief strike, mainly over union demands for a 20-hour week. Under the new contract, electricians were to work a sixth hour daily at time and one-half instead of the seventh hour called for in the old contract.

The longest and one of the most bitter strikes on record in the United States was settled on Sept. 29, 1962, when the Kohler Co. of Sheboygan, Wis., agreed to sign a contract with the United Auto Workers. The strike had begun on April 14, 1954, when Local 833 of the auto workers and the firm, which manufactures plumbingware, were unable to settle the union shop issue. In June 1962 the U.S. Supreme Court upheld a National Labor Relations Board (NLRB) decision which had found the Kohler Co. guilty of unfair labor practices in a case growing out of charges by the union. Shortly thereafter, negotiations were undertaken and terms were agreed upon in September. The new one-year contract, signed on October 8, did not contain a union shop clause, nor did it provide wage increases, but a number of fringe benefits were made more liberal.

Distribution of Nonagricultural Employment.—The accompanying table provides data on nonfarm employment by various industry groups for the year 1961 and for April and October 1962.

Labor Force, Employment, and Unemployment.—The civilian labor force increased by less than 1% from October 1961 to October 1962, but the total number of persons employed rose by approximately 1.5% during the same period, and in October 1962 was more than 1 million higher than a year earlier. The expansion in employment took place almost entirely in the first six months of the year and was consistent with the course of recovery from the nation's fourth postwar recession. Nonfarm payroll employment stood at 56.3 million in October 1962; seasonally adjusted, this was 1.2 million above the figure for January but virtually the same as in July. Important gains were made during the first six months of 1962 in durable goods manufacturing, state and local government, and service and finance industries; but there were slight declines in manufacturing employment after July.

The economic recovery which continued into 1962 was not sufficient to bring the seasonally adjusted rate of unemployment below 5% of the civilian labor force during the year. The rate was 5.8% in January and reached a low of 5.3% in July, but rose to 5.8% in August, September, and November. The October level of 5.5% was close to the average for the year and represented a substantial improvement over the rate of 6.7% for October 1961.

The number of long-term unemployed—those out of work 15 weeks or more—was 865,000 in October 1962, compared with 1,240,000 in October 1961.

Trade Union Developments.—The American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) reported a membership of 12.5 million in the United States on June 30, 1962, substantially the same as a year earlier. The membership was distributed among 131 affiliated national and international unions and 361 directly chartered locals.

A resolution urging a 35-hour workweek as a remedy for unemployment was approved at the AFL-CIO's Executive Council meeting, Aug. 13–16, 1962. At the time, the council noted that unemployment had been over 5% of the civilian labor force for the previous 57 months, and complained that measures taken thus far to reduce it had proved inadequate. The council resolved that the shorter workweek should be pursued through collective bargaining and efforts to secure amendment of the overtime provisions of the Fair Labor Standards Act.

At its August meeting, the council also heard a report on the first seven months' operation of the internal disputes machinery which was established by the AFL-CIO convention in December 1961. The report listed 100 complaints and claims filed by 50 unions under the system during the period ending July 31, 1962. Of these, 54 were resolved by mutual agreement between the parties with the aid of mediation, 13 were undergoing mediation at the time of the report, another 18 had been processed by the system's impartial umpire, David L. Cole, and 15 cases awaited his consideration.

For the first time since its establishment, the AFL-CIO in 1962 approved plans for a major coordinated organizing drive by a number of affiliated unions. The federation will depend heavily on the voluntary understandings concerning jurisdiction between the unions involved in the drive. Los Angeles was chosen as a likely testing ground for the plan.

Federal Legislation.—The Manpower Development and Training Act of 1962 was signed by the president on March 15. This law directs the federal government to assess the manpower needs of the nation and to develop training programs to equip unemployed or underemployed workers to fill these needs. The Department of Labor was made responsible for determining occupational needs, selecting trainees, and placing them when their training is completed; and the Department of Health, Education, and Welfare was to make arrangements with states for the training. The program was designed to run for three years; it will cost $435 million in federal funds, with some matching funds to be provided by the states. The Department of Labor announced on November 8 that 10,000 workers were in training under the act; training projects had been approved for 34 states.

On March 20, 1962, the president approved Public Law 87–420, which amended the Welfare and Pensions Disclosure Act of 1958. Designed to make the act more effective, the amendments specify in greater detail the financial data fund that administrators must file with the secretary of labor, and empower the secretary to investigate these reports. When it appears that there are violations of the act's provisions, the new law authorizes the secretary to bring action in federal court to have the illegal acts or practices enjoined. Penalties for making false reports or embezzling funds, or accepting, offering, or soliciting bribes or kickbacks are punishable by imprisonment or fines, or both.

President Kennedy on August 13 signed Public Law 87–581 (the Work Hours Standards Act of 1962), which requires overtime payments to employees of contractors engaged in work done under contract for, or with financial aid from, the federal government. Projects using federal funds provided to the states or their subdivisions were affected by the new law, which requires that all employees be paid time and one-half for work exceeding 8 hours in one day and 40 hours in one week.

State Legislation.—A limited amount of labor legislation was produced in the legislatures of the 22 states that held regular sessions in 1962. Four states extended and three states restricted the coverage of their unemployment compensation laws, and the State of New York modified the basis on which employees of local governments may be covered. Kentucky and Virginia raised the maximum and minimum weekly benefits (maximums to $40 in Kentucky and $34 in Virginia, and minimums to $12 in both states). Michigan and Massachusetts liberalized dependents' allowance provisions. The laws of Alaska and Delaware were amended to enable otherwise eligible individuals to receive unemployment benefits while undergoing an approved training or retraining course, bringing to 20 the number of state unemployment compensation laws under which this is now permitted.

The minimum wage was raised in Alaska, Hawaii, Massachusetts, New York, and Rhode Island in 1962. Of these five states, four increased the statutory minimum from $1 to $1.25 in two steps (with $1.15 the intermediate step), the $1.25 minimum becoming effective in Massachusetts and Rhode Island in 1963, and in Hawaii and New York in 1964. Alaska raised its minimum from $1.50 to $1.75 in two steps by requiring it to be 50 cents higher than the prevailing federal minimum wage (which goes to $1.25 in September 1963).

Workmen's compensation laws in eight states were improved by increasing benefits or their duration. Increases in maximum weekly benefits ranging from $2 to $8 were established for all types of disability in Kentucky and New Jersey; for all types of disability and death in New York and Virginia; for total disability and death in Maryland; and for schedule injuries in Rhode Island. Massachusetts extended the duration of benefits for all schedule injuries except injuries to the eyes, and Alaska increased the burial allowance from $500 to $1,000. In addition, in the Mississippi law, which covers accidental death or injury only, injury was broadened in definition to include disability or death due to ionizing radiation.

Strikebreaking was regulated in laws passed in 1962 by Michigan, Louisiana, and Massachusetts. The laws prohibited anyone but those directly involved in a dispute from importing replacements for strikers. Michigan outlawed employment of professional strikebreakers altogether. Georgia, Kentucky, Mississippi, South Carolina, and Virginia outlawed the practice by shippers or carriers of paying unions a fee for railroad "piggyback" loads of truck trailers or motor vehicles capable of being moved on the highway.

Labor and the Law.—The U.S. Court of Appeals for the District of Columbia ruled that union funds may not be spent to defend union officers accused of wrongdoing that would be detrimental to their union and its members. The decision was handed down on July 19, 1962, in a case involving 13 rank-and-file members of the Teamsters Union whose suit against the union originally led to the appointment by Federal District Judge F. Dickinson Letts of a board of monitors to govern the union. On Jan. 28, 1961, Judge Letts had dissolved the board of monitors and had denied a motion made in behalf of the 13 members which asked that union funds not be used for the defense of union officers.

The appellate court held that "the treasury of a union is not at the disposal of its officers to bear the cost of their defense against fraudulently depriving the members of their rights as members," but noted that these principles may not apply fully in the case of the monitorship because of its unique character. The court did rule that the same lawyers may not represent both the union and the officers in situations such as this.

The U.S. Sixth Circuit Court of Appeals, in a decision handed down on June 8, 1962, ruled that agency shop clauses violate the Taft-Hartley Act. Specifically, the court said that the agency shop clause which requires nonunion employees to pay a fee to a union in lieu of membership, is contrary to the Taft-Hartley Act. The decision reversed an earlier decision of the NLRB which held that Taft-Hartley Act provisions authorizing the union shop are broad enough to include the agency shop. In November the Supreme Court agreed to review this case.

NLRB Decisions.—In a case involving the Darlington Manufacturing Co., a textile firm in South Carolina, the NLRB decided that closing a plant because its employees chose to be represented by a union is illegal. The case was initiated in 1956 when the Darlington Co. shut down its mill and dismissed 500 employees after the Textile Workers Union of America had won the right to represent them through an NLRB election. By a 3–2 majority, the NLRB held that the company had discriminated against employees for union activity, which is prohibited by the Taft-Hartley Act. When it closed the plant, the company explained that the action was taken because of economic factors, but contended that its right to close the plant, regardless of the reason, was absolute.

NLRB decisions in two cases handed down in August provided guidelines the board will use to determine whether a representation election should be set aside because of racial propaganda. In one of the cases a representation election was voided because the employer's propaganda, the board decided, was calculated to influence employees to reject the union on racial grounds alone. In the second case, the board found that propaganda used by the employer was not inflammatory and was related to issues in the representation election. It consisted of an accurate description of the union's policy on racial integration and a newspaper account of the union's activity in connection with school desegregation in a nearby city. The board ruled that it was therefore permissible to use an accurate statement of the other party's position on racial questions as long as racial prejudice is not inflamed.

A decision by the U.S. Court of Appeals for the Second Circuit in January 1962 denied the authority of the NLRB to hold representation elections on ships of foreign registry, even though they are owned and operated by foreign subsidiaries of a United States corporation. The court held that the Taft-Hartley Act was not applicable to foreign seamen hired on such vessels under foreign shipping articles, even though labor relations aboard these ships affected the commerce of the United States.

In a ruling on November 20, the NLRB lengthened from two to three years the period during which a labor contract may act as a barrier to holding a representation election. According to this new rule, a four-year contract would bar an election for three years, as would a three-year contract, but one of two years' duration would act as a bar only during its life. The board reasoned that this change would enhance the stability of labor relations in industry and would have only a slight effect on employees' freedom to be represented by a union of their choice.

LAOS

The landlocked Kingdom of Laos is bounded by Communist China on the north, Burma on the northwest, Thailand on the west, Cambodia on the south, and North Vietnam and South Vietnam on the east. It has an area of about 91,000 square miles, and a population of 1,850,000 (mid-1961 est.). The administrative capital is Vientiane (est. 100,000); the residence of the king is Luang Prabang (15,000). French is the official language.

Government.—Laos is a constitutional monarchy having a hereditary ruler, King Savang Vatthana (acceded Nov. 4, 1959); and a National Assembly, premier, and cabinet. Following the Geneva agreement of 1954 and a three-year war between the government and the Communist-controlled Pathet Lao rebels, Laos was unified in November 1957 through the transformation of the Pathet Lao into a political party and the integration of Pathet Lao troops with the national army. After the party registered gains in elections of May 1958, non-Communist leaders united to form a government which excluded the Communists, and in 1959 the Pathet Lao again resorted to guerrilla warfare in an attempt to overthrow the government.

Following lengthy parleys between three main rival factions, an accord was signed on June 12, 1962, to establish a coalition government of royalist, pro-Communist, and neutralist leaders. Prince Souvanna Phouma, the neutralist leader, was installed as premier on June 23, 1962. One month later a 14-nation conference in Geneva was concluded with the signing of agreements to guarantee the independence and neutrality of Laos. (See below, *Events, 1962.*)

Laotian political parties are the royalist Paxa Sangkhom (Democratic Party of Social Progress), led by King Savang Vatthana; the neutralist Assemblage of the Laotian People, founded by Prince Souvanna Phouma; the moderately leftist Santiphab, which favors relations with the Communist bloc; Neo Lao Haksat (ex-Pathet Lao), the pro-Communist movement led by Prince Souphanouvong; and the Lao Penh Kang (Party of Neutral Laos), headed by Prince Souvanna Phouma and Gen. Kong Le.

Education and Religion.—The literacy rate is estimated at 15%. School enrollment (1960): 114,373. Number of schools (with enrollments): 1,426 primary (101,204); 6 secondary (2,157); 1 technical (126). There are also 11 Chinese schools (4,500 pupils) and 10 Vietnamese schools (3,000). Buddhism is the principal religion; many primitive tribes practice animism.

Finance.—The monetary unit is the kip (80 kips equal U.S.$1). Budget receipts, fiscal year 1961–62 est.: 1,080 million kips (548 million in 1960–61); expenditures, 1,475 million (1,792 million). Foreign aid, chiefly from the United States, totaled an estimated 744 million kips in 1961–62 (384 million in 1960–61). Capital investment for 1961–62 was estimated at 682 million kips.

Transportation and Communications.—Transport systems are generally inadequate to the country's needs. The only railway is provided by the State Railway of Thailand, which has extended its line from Bangkok to Nong Khai in Laos. Roads are generally undeveloped and badly maintained, although a road-building program financed by United States aid has added about 500 miles to the existing 1,200 miles of surfaced roads. The Mekong River and its tributaries provide the principal means of transporting cargo. Air Laos operates internal services and connections with nearby capitals; four foreign airlines also use the international airport at Vientiane. Other data: passenger cars, 5,000 (1960); telephones, 736 (1960); radio sets, 15,000 (1957).

Economy.—Laos has a preponderantly agrarian economy, little or no industry, and a very limited commercial sector. Per capita income is only about $50 per year, and the per capita level of food consumption (1,900 calories daily) is one of the lowest in Asia. Laotian agriculture is characterized by the extensive use of land and labor, and by low capital investment. About 95% of agricultural land is allocated to rice production (approximately 520,000 tons annually). Other crops are corn, coffee, tea, tobacco, cotton, peanuts, and vegetables. Livestock numbers have declined in recent years because of rinderpest and other diseases; in 1962 there were about 104,000 water buffaloes, 246,000 cattle, and 177,400 pigs. The only mineral mined is tin; output in 1959 was 555,300 tons, valued at 253 million kips.

Foreign Trade.—Total exports, 1960: 75 million kips (down 4% from 1959); imports, 946,800 million (down 7%). Principal exports (in million kips, 1960): tin, 33,300; cardamine, 5,800; green coffee, 6,600. Principal imports (in million kips): metallurgic and mineral products, 309,200; food products, 220,500; machinery, 85,300; textiles, 77,800. The annual trade deficit has been reduced by means of financial aid from the United States and other countries. Chief trading partners are the United States, France, and Thailand.

WIDE WORLD

Meeting in the Plaine des Jarres section of northeastern Laos on June 8 to try once again to form a coalition government acceptable to the three contending factions of Laos are (l. to r.): Prince Souphanouvong, Gen. Phoumi Nosavan, Prince Souvanna Phouma, and Premier Prince Boun Oum.

Events, 1962.—As a result of continuing political and economic instability, Laos in 1962 was again dependent on foreign aid for its very existence. United States aid in 1962 totaled $45 million, of which $31 million was for military purposes. French assistance, which amounted to 3,290 million old francs in the period 1955–60, was used chiefly for mining surveys, agricultural studies in the Vientiane region, and the construction of a steel bridge at Luang Prabang, radio towers, and hospitals. Aid received from Great Britain through the Colombo Plan and from Australia, Japan, and New Zealand has financed bridge construction, business operations, and technical programs. An important international project is the dam development of the Mekong River Basin, completion of which will extend electric power throughout the country.

Representatives of 14 countries signed agreements at Geneva on July 23 to guarantee the neutrality and independence of Laos, following a 15-month conference aimed at removing the kingdom from the cold war between the Communist camp of nations and the free world. Soviet Foreign

At Geneva on July 21, Prince Souvanna Phouma is flanked by Soviet Foreign Minister Andrei Gromyko (left) and British Foreign Secretary Lord Home, as a treaty that pledges the independence and neutrality of Laos is formally approved.

WIDE WORLD

Minister Andrei A. Gromyko presided over the signing ceremony. The United States was represented by its secretary of state, Dean Rusk, and by W. Averell Harriman, assistant secretary of state for Far Eastern affairs.

The delegates at the conference signed two documents. A protocol defined the procedure of the three-nation International Control Commission for supervising the withdrawal of foreign troops and taking other steps necessary for the establishment of neutrality. A declaration, signed by all conferees except Laos, pledged respect for the new status of the kingdom.

Soviet Premier Khrushchev noted that the agreements were "of signal international importance in removing a dangerous hotbed of war," and claimed that they represented a "major victory" for his policy of peaceful coexistence. President Kennedy hailed the agreements as a "significant milestone in our efforts to maintain and further world peace." The American government, however, was confronted with the fact that the Soviet Union apparently sought to use the neutral regime to increase its influence over Southeast Asia, while the United States was committed to the creation of a buffer zone between the Communist states and the pro-Western nations in the region. The Kennedy administration was particularly concerned to attain a neutral Laos before the country fell completely under Communist influence and further expose the pro-Western troops struggling against Communist guerrillas in South Vietnam. From a military viewpoint, the loss of Laos to the Communists would open the Mekong River Valley as a direct route from Communist China and North Vietnam into the heart of Southeast Asia.

The Geneva agreements were preceded by protracted negotiations between the royalist, pro-Communist, and neutralist leaders in Laos. Prince Boun Oum, premier of the royal government, at first opposed the United States-backed plan to form a coalition cabinet, and as a result the United States temporarily suspended financial aid to Laos early in the year. The royalist government was eventually persuaded to resume negotiations. On June 11, Prince Boun Oum, neutralist leader Prince Souvanna Phouma, and pro-Communist leader Prince Souphanouvong announced agreement on the composition of a coalition cabinet. Prince Souvanna Phouma and 10 other neutralists were included in the 19-member cabinet; the remaining ministers were equally divided between representatives of the royal government and of the pro-Communist Pathet Lao movement. Prince Boun Oum retired from governmental affairs, but Gen. Phoumi Nosavan, former minister of defense in the royalist government, was appointed minister of finance and a deputy premier in the new cabinet. Prince Souphanouvong became economics minister and also a deputy premier.

Prince Souvanna Phouma paid a four-day visit to the United States in late July. The new premier conferred in Washington with President Kennedy on July 27, and reportedly received assurances that the United States would cooperate with the new government in making viable a neutral and independent Laos. The United States on September 3 delivered its first payment of $2 million in aid to the coalition government, and on November 24 it reportedly offered to provide $10 million as part of a new economic aid program.

Although the new regime professed neutrality, one of its first actions was to announce, on September 7, that Laos would establish diplomatic relations with Communist China and North Vietnam.

Laotian Foreign Minister Quinim Pholsena, on September 29, presented to the United Nations a proposal to neutralize all Southeast Asia by means of an "immediate end to foreign intervention," which he said was "a grave menace for peace." The proposal was opposed by the pro-Western states of Thailand and South Vietnam.

Premier Souvanna Phouma, on October 8, was granted full powers for one year by the rightist-controlled National Assembly in order to achieve military and administrative integration. He evidently realized that this vote of confidence was essential since one half of Laos was in the hands of the Pathet Lao. Previously, in early May 1962, rebel forces completed their conquest of northwestern Laos, in violation of the cease-fire agreement of May 1961.

The new government was faced with three formidable tasks in rebuilding Laos: the removal of foreign troops; integration of the three separate military forces; and holding national elections. If any one of these difficult tasks was not achieved, many observers believed that civil war might again ravage the kingdom. Neither the neutralist premier nor Prince Souphanouvong admitted to the presence of Communist troops from North Vietnam in any area under his control, but some Western officials reported that at least 10,000 North Vietnamese soldiers and advisers have supported the Pathet Lao guerrillas and the neutralist forces. As the two princes declared that the only North Vietnamese serving in their armies were civilian workers and technicians, the International Control Commission could not verify with certainty either the presence or evacuation of foreign troops.

Military integration of the forces in Laos posed a most delicate problem because of the divergent views held by the military leaders. Prince Souvanna Phouma was certain that all royal army units pledged to him could be integrated without difficulty with the royal army units under Gen. Phoumi Nosavan, since all the units originally were part of the same army loyal to the king. On the other hand, Gen. Kong Le, commander of neutralist army forces, has professed unity with the Pathet Lao forces, and has accused the United States of attempting to turn Laos "into a military base for its aggression against the socialist camp." The government on November 27 approved the formation of a unified army of 30,000 men, to be drawn equally from the existing armed forces of the three factions.

Lastly, the problem of holding national elections threatened to bring the coalition government to an impasse. The Pathet Lao demanded that elections be held within six months after the government took office, but pro-Western factions attempted to postpone the elections as long as possible.

Premier Souvanna Phouma's coalition cabinet on August 23 agreed to designate three separate exit points where foreign troops could be evacuated from Laos. The International Control Commission stationed observers at the designated points and later verified that foreign troops had withdrawn by the deadline of October 6. By that date the last of 800 United States military men in the country had been evacuated from Vientiane, but there were conflicting reports as to whether all North Vietnamese troops had actually left Laos.

LATIN AMERICA. See INTER-AMERICAN AFFAIRS; articles on the Latin American countries; and the Index entry, *Latin America.*

LATIN AMERICAN LITERATURE

Despite its richness and variety, Latin American literature continues to be virtually unknown in the United States, although such figures as Octavio Paz and Jaime Torres Bodet are widely admired in Europe. Elena Garro has had work staged by Ingmar Bergman; Jorge Luis Borges has shared an international prize with Samuel Beckett; and he and Pablo Neruda were widely mentioned as candidates for the 1962 Nobel Prize in literature; yet, they are little known in the United States. There is hope that this situation may be remedied with the aid of a Rockefeller Foundation grant for the translation of literary and scholarly works, but all indications point to a slow and at best partial production.

Fiction.—Among the most important books of 1962 was *Confabulario total,* the collected work of the Mexican Juan José Arreola, whose short stories are characterized by enormous versatility within an essentially pessimistic and existential view of the universe. Another collection was *Antología personal,* the Argentinian Borges' own selection from one of the distinguished literary productions in Spanish. The Mexican novelist Carlos Fuentes published two novels in 1962, *Aura* and *La muerte de Artemio Cruz.* The former, in particular, represents a considerable shift from the technical virtuosity of his best-selling *La región más transparente.* Virtually a psychological fantasy, *Aura* is written in a much more direct style.

The Chilean generation of 1950 was represented by *El acantilado,* in which Jaime Laso employs the tale of an aging sea captain's last voyage to trace the story of man's frustration and irrevocable defeat. The oddly unreal atmosphere within a realistic framework is characteristic of much of Latin America's best fiction today. The winner of the international novel contest sponsored by the excellent Argentinian publishing house Losada, was an unknown Argentinian, Iverna Codina, whose *Detrás del grito* is a portrait of smuggling and exploitation of the miners in the province of Mendoza in the years 1918–32. This social preoccupation reflects another constant in Latin American literature.

Among established authors represented were the Venezuelan Arturo Uslar Pietri and the Chilean Marta Brunet. Pietri's *El laberinto de fortuna* is an analysis of the moment following the death of the dictator Juan Vicente Gómez (Dec. 17, 1935); in larger terms, it is an inquisition into the nature of Venezuelan society. Brunet received the Chilean National Prize for Literature in 1961 for her novels and short stories, which are characterized by sensitive portrayals of feminine characters and an authentic feeling for nature as a formative element in man's consciousness. *Antología de cuentos* was a selection of the best of her shorter works.

Poetry.—One of the most significant volumes in some time was *Material poético,* the complete work of the Mexican Carlos Pellicer, who is distinguished by his use of his native tropical landscape as a vehicle for spiritual themes. This volume is an imposing testimony to Pellicer's stature as one of the major living poets. Another of the giants is the Chilean Pablo Neruda, whose *Cantos ceremoniales* reflected his development in recent years toward a more sustained form and more controlled imagery within a fundamentally surrealistic esthetic. The Argentinian Eduardo González Lanuza received the National Poetry Prize for 1961 with his *Suma y sigue,* and the Colombian Jorge Gaitán Durán (d. 1962) emphasized the twin strains of eroticism and social preoccupation in *Si mañana despierto.*

Among younger poets, the Paraguayan Elvio Romero continued to pursue his personal blend of surrealist expression and themes from the regional tradition. One of the youngest of established poets is the Mexican Marco Antonio Montes de Oca, whose *Cantos al sol que no se alcanza* projected him into an important position.

Theater.—Drama in Latin America remained erratic, with explosions of activity followed by periods of somnolence. This trend is directly related to the amount and kind of official aid; there is no shortage of fine young playwrights. The most visible influence is that of Brecht, although the antirealistic movement of the last ten years shows the influence of Williams and Miller, among others. A new and very young movement closely related to the "theater of the absurd" has appeared, particularly in Mexico, where, in addition to foreign dramatists, Elena Garro has stimulated many of the younger group. Among better-known dramatists, the Puerto Rican René Marqués continued his highly personal blend of nationalism and preoccupation with the tragic absurdity of man's condition in *La casa sin reloj,* while the Mexicans Luisa Josefina Hernández (*Los duendes*) and Emilio Carballido (*Un pequeño día de ira*) continued their eclectic experimentation.

Nonfiction.—The most important, if not the most widely heralded works of nonfiction appeared to be in the area of scholarship. Reliable studies of most national literatures are now available, and in works such as Andrew Debicki's study of a major Mexican poet, *La poesía de José Gorostiza,* we are beginning to have serious interpretation and assessment of important living figures. Important bibliographies continued to be published, such as Alfredo Roggiano's bibliography of the Argentinian poet Leopoldo Lugones (1874–1938) and Ruth Lamb's of 20th century Mexican theater. Re-editions of important critical works included Olavarría and Ferrari's *Reseña histórica del teatro en México,* which was republished with a prologue by Salvador Novo and an added chapter by David Arce to cover the present century. One of the better collections of essays was *Carnet crítico,* by the Chilean Ricardo Latcham.

Translations.—Works published in English in 1962 (unless otherwise noted) included: Alegría, Ciro, *Broad and Alien Is the World,* tr. by Harriet de Onís; Borges, Jorge Luis, *Ficciones,* ed. by Anthony Kerrigan, and *Labyrinths,* ed. by D. A. Yates and J. E. Irby; Garcilaso de la Vega, el Inca, *The Royal Commentaries,* tr. by Maria Jolas from the French ed.; León-Portilla, Miguel, ed., *The Broken Spears: the Aztec Account of the Conquest of Mexico,* tr. by Lysander Kemp; Núñez Cabeza de Vaca, Alvar, *Adventures in the Unknown Interior of America,* tr. by Cyclone Covey; Orozco, José Clemente, *An Autobiography,* tr. by Robert Stephenson; Picón-Salas, Mariano, *A Cultural History of Spanish America, from Conquest to Independence,* tr. by Irving Leonard; Paz, Octavio, *The Labyrinth of Solitude,* tr. by Lysander Kemp; Ramos, Samuel, *Profile of Man and Culture in Mexico.* tr. by Peter Earle; Sarmiento, Domingo Faustino, *Life in the Argentine Republic in the Days of the Tyrants;* and *New Voices of Hispanic America,* ed. and tr. by Darwin Flakoll and Claribel Alegría.

Professor of Romance Languages,
Rutgers University.

LATTER-DAY SAINTS. See CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS.

LATVIA

The Latvian Soviet Socialist Republic of the USSR is located on the east coast of the Baltic Sea. It has an area of about 25,000 square miles, and a population of 2,094,000 (1959), about 56% urban. In 1959, 62% of the population were Latvians, an Indo-European people; 27% Russians; and the remaining 11%, mostly Belorussians, Poles, Jews, Lithuanians, and Ukrainians. Principal cities and populations (1959): Riga, the capital, 605,000; Liepaja (Libau), 71,000; and Daugavpils (Dvinsk), 65,000.

Government.—Independent since 1918, Latvia was forcibly annexed to the USSR in 1940, and reoccupied near the end of World War II. The United States does not recognize the annexation. The Latvian legislature is a single-chamber Soviet elected for 4-year terms. It rarely meets,

and between sessions delegates its authority to a Presidium headed by Yan E. Kalnberzin, and a Council of Ministers (cabinet). On April 23, 1962, Vitaliy P. Ruben replaced Yanis V. Peyve as premier. The Latvian government has no political autonomy, but merely fulfills orders from Moscow. All important posts are held by members of the Latvian Communist Party, headed by Arvid Y. Pelshe, the first secretary. Of the party's 76,642 members, only about half are Latvians, and two fifths are in the army and police.

Education and Religion.—School enrollment, 1961: 143,000 in grade and high schools, 24,000 in technical high schools, and 19,000 in colleges. Principal religions: Lutheran (the majority), Roman Catholic, Russian Orthodox.

Finance.—Government expenditures, 1962 est.: 496,735,000 new rubles (476,006,000 in 1961). One new ruble equals U.S.$1.12.

Transportation and Communications.—Transport networks (miles, 1961): railroads, 1,940; roads, 15,500; paved roads, 1,400. Telephones number 60,400.

Manufactures and Minerals.— Major industrial products (metric tons, 1961): steel, 88,000; sugar, 102,200; chemical fertilizer, 315,000; cotton textiles, 46,700,000 square meters. Of total USSR output (1962), Latvia produced telephone switchboards, 44%; trolley cars, 20%; washing machines, 14%; and radio receivers, 13%.

Agriculture.—Sown area: about 3,660,000 acres, owned by 970 collective farms and 162 state farms, operating 14,000 tractors and 8,500 trucks. Main crops: grain, potatoes, hay, flax, and sugar beets. Livestock, 1961: 843,000 cattle; 555,000 sheep and goats.

Foreign Trade.—Latvian goods are exported to 60 foreign countries. Most trade however is with the remainder of the USSR. Chief exports, 1962: electrical machinery, radio receivers, trolley and railway cars, furniture, butter, bacon, and canned fish. Main imports: coal, petroleum, metals, timber, and grain.

Events, 1962.—During the year the Latvian trade unions grew to a membership of 750,000, and the Komsomol (Young Communist League) to 142,000. Latvian government and Communist Party officials continued to admit the existence of Latvian nationalist and anti-Communist attitudes among the population. An intensified Communist campaign against religion contributed to anti-Soviet sentiments. For this reason the USSR maintained an occupation army of 100,000 men in Latvia, most of whom are Russians and other non-Latvians. Generals of the Soviet Army played an important role in the Latvian government.

ELLSWORTH RAYMOND,
USSR Area Specialist and Associate Professor of Government, New York University.

LAUGHTON, Charles

English-American actor: b. Scarborough, Yorkshire, England, July 1, 1899; d. Los Angeles, Calif., Dec. 16, 1962.

Charles Laughton (1899–1962)

UPI

In his 33 years of motion picture acting, Charles Laughton played character roles as divergent as the grotesque Quasimodo in *The Hunchback of Notre Dame* (1939) and the butler who recited the *Gettysburg Address* in *Ruggles of Red Gap* (1935). His obese figure and the face that he claimed "would stop a sundial" were familiar in a multitude of other parts, ranging from the sadistic Captain Bligh of *Mutiny on the Bounty* (1935) to the appealing grandfather in *It Started with Eve* (1941); from the crafty, unscrupulous Southern senator in his last film, *Advise and Consent* (1962) to the gluttonous, henpecked king at the end of *The Private Life of Henry VIII* (1933). Although he portrayed many odious characters, he never became typed; and while the Laughton grunt, sneer, bellow, lip-smacking, and pained expression were screen trademarks, his acting transcended idiosyncracy.

Laughton's career began in the London theater. His parents were hotelkeepers, and he went to London at the age of 16 for hotel training at Claridge's. He served in the British Army in 1918, was gassed, and at the end of the war entered his father's business. In 1925, however, his parents agreed to send him to the Royal Academy of Dramatic Art in London, where he won a gold medal. He made his first stage appearance as Osip in Gogol's *The Government Inspector* on April 28, 1926. After numerous London successes, he opened in New York in Jeffrey Dell's *Payment Deferred* (1931) with Elsa Lanchester, to whom he was married in 1929 and who later appeared in many of his motion pictures. He played Chekhov and Shakespeare with the Old Vic–Sadler's Wells Company in 1933–34, and in 1936 was the first English actor to appear at the Comédie Française, Paris (as Sganarelle in Molière's *Le médecin malgré lui*). Returning to the stage in 1947, he was seen that year in Brecht's *Galileo* (Los Angeles and New York), and subsequently in Chekhov's *The Cherry Orchard* (New York 1950), Shaw's *Major Barbara* (New York 1956), Jane Arden's *The Party* (London 1958), and *King Lear* (Stratford-on-Avon 1959).

The English film *Piccadilly* (1929) marked Laughton's screen debut. In 1932 he went to Hollywood with a Paramount contract and appeared that year in several pictures, notably as Nero in *The Sign of the Cross*. During the 1930's he played his most memorable parts, among which were Barrett in *The Barretts of Wimpole Street* (1934), Javert in *Les Misérables* (1935), and the title role in *Rembrandt* (1936). His Henry VIII won him an Academy of Motion Picture Arts and Sciences "Oscar" award for best male actor, presented in 1934. Recent motion pictures included *O. Henry's Full House* (1952), *Hobson's Choice* (1954), and *Witness for the Prosecution* (1958). He co-produced several films in 1938–39 and later directed plays and a movie (*The Night of the Hunter*, 1955).

Laughton began dramatic readings from the Bible and the classics for veterans hospitals in World War II, and continued them for the general public after 1947. He frequently read on radio and television, as well as on the stage. With the First Drama Quartet, in 1951–52, he toured the United States in a reading of *Don Juan in Hell*, the third act of Shaw's *Man and Superman*. He adapted and staged a dramatized reading of the S. V. Benét poem *John Brown's Body* in 1953. His narration of Dickens' *Christmas Carol* was an annual television event.

Laughton became a United States citizen in 1950. *Charles Laughton and I*, by Elsa Lanchester, was published in 1938.

LAW

The following article summarizes some of the more significant opinions handed down during the 1961–62 term of the U.S. Supreme Court. For membership of that body and statistics on the

court's opinions during the year, see the article SUPREME COURT, U.S. A discussion of major federal laws passed in 1962 will be found under UNITED STATES—*The United States in 1962*, and of major state laws, in the articles on individual states. For international law, see the article under that heading; for laws or legal decisions relating to special fields, see such articles as CIVIL LIBERTIES, EDUCATION, HOUSING, LABOR, and TAXATION; and for further references see the Index entry, *Law*.

Business Regulation; Antitrust Laws.—*California* v. *Federal Power Commission* (369 U.S. 482) involved a conflict between the operation of the antitrust laws and the action of an administrative agency. After one natural gas company had acquired most of the stock of another such company, the federal government sued under the Clayton Act to require divestiture. Prior to the determination of the antitrust case, the company which had acquired the stock of the other company received permission of the Federal Power Commission to merge the assets of the two companies. The U.S. Supreme Court held that the commission should have awaited the outcome of the antitrust case before passing on the merger application.

In *Brown Shoe Co.* v. *United States* (370 U.S. 294), the court upheld a determination that a merger of two corporations violated the Clayton Act because the effect would be substantially to lessen competition or tend to create a monopoly in the production, distribution, and sale of shoes. The decision was based on a conclusion that the shoe industry was being subjected to a cumulative series of vertical mergers which, if left unchecked, might substantially lessen competition in the retail sale of men's, women's, and children's shoes.

In *Sunkist Growers, Inc.* v. *Winkler & Smith Co.* (370 U.S. 19), a judgment for treble damages under the Clayton Act had been granted by the trial court against an areawide citrus fruit marketing cooperative and a processing corporation, for conspiring to restrain and monopolize interstate trade in citrus fruit and byproducts. The Supreme Court reversed, because of the exemption from the antitrust laws accorded to agricultural cooperatives by the Clayton and Capper-Volstead acts.

In a Clayton Act suit for selling milk at prices which discriminated between independently owned groceries and chain stores, the trial court had accepted the justification that there was a difference in the cost of sales and deliveries. The Supreme Court decided that this decision was erroneous, because the lower court had relied on average costs of sales and deliveries to chain stores and independents, and there was not enough resemblance among individual members of each class to make acceptable cost justifications on the basis of class (*United States* v. *Borden Co.*, 370 U.S. 460).

In *Lou Poller* v. *Columbia Broadcasting System* (368 U.S. 464), the court held that a complaint by a television broadcasting station alleging the cancellation of a network affiliation and the purchase of a competing station by the defendant network could not be summarily dismissed, because the evidence might show a conspiracy to restrain and monopolize trade in violation of the Sherman Act. In a civil suit for treble damages for violation of the monopoly provisions of the Sherman Act, the court held that it was the function of the jury to decide whether the defendant's conduct had caused injury to the plaintiff's business (*Continental Ore Co.* v. *Union Carbide Corp.*, 370 U.S. 690). Finding error also in the refusal of the trial court to admit evidence that the plaintiff had been excluded from the Canadian market in vanadium by the actions of a wholly owned subsidiary of the defendant, the court remanded the case for a new trial.

In *United States* v. *Wise* (370 U.S. 405), it was held that a corporate officer was subject to criminal prosecution under the Sherman Act whenever he knowingly participated in effecting an illegal contract, combination, or conspiracy, regardless of whether he was acting in a representative capacity. Where there was a genuine factual issue as to whether an acquired corporation was a "failing company," so that the acquisition of its assets would not violate the Clayton Act, the court decided that it was error for a district court to dismiss the government's case on a motion for summary judgment (*United States* v. *Diebold, Inc.*, 369 U.S. 654).

In a suit under the Securities Exchange Act of 1934, the evidence did not show that a brokerage partnership bought stock of a corporation of which one of its partners was a director, acting on the advice of this partner (*Blau* v. *Lehman*, 368 U.S. 403). The court decided that the partner was liable only for his proportionate share of the "short-swing" profits, and that the partnership was not liable for the full amount of the profits.

Taxation.—In *Rudolph* v. *United States* (370 U.S. 269), the Supreme Court refused to review the findings of lower courts that the payment by an insurance company of the expenses of a group of agents and their wives to attend a convention was primarily for the purpose of providing a pleasure trip in the nature of a bonus or reward, and that the value of the trip was income to the agents.

Relying heavily on the legislative history of the Internal Revenue Code of 1954, the court disallowed the deduction, as an expense for "medical care," of the rent paid for an apartment in Florida, where the taxpayer had been ordered by his physician to spend the winter months (*Commissioner* v. *Bilder*, 369 U.S. 499). In *United States* v. *Davis* (370 U.S. 65), the plaintiff transferred to his former wife, in a property settlement, certain stocks which had appreciated in value since he had purchased them, and paid her attorney's fees for tax advice given to her. The court held that the plaintiff must pay an income tax on the accretion of value of the stocks, and that he could not deduct the legal fees paid to his wife's attorney.

In *Simonson* v. *Granquist* (369 U.S. 38), the court held that section 57(j) of the Bankruptcy Act, which bars penalties or forfeitures owing to the United States or to any state except for the amount of the pecuniary loss sustained, was broad enough to bar a federal tax penalty which had been secured by a lien prior to the filing of a petition in bankruptcy. In *Enochs* v. *Williams Packing Co.* (370 U.S. 1), the court interpreted a provision of the Internal Revenue Code which prohibits suits to restrain the assessment or collection of any tax as being a bar to such suits except in the rare instances where the government's claim of liability was entirely without foundation.

In *Central Railroad Co.* v. *Pennsylvania* (370 U.S. 607), the court held that the State of Pennsylvania could constitutionally tax a railroad on the full value of its freight cars, including those used by railroads in other states, because the railroad had failed to prove that such cars were taxable in any other state. The court decided, however, that other cars which were regularly run in New Jersey and were subject to a New Jersey tax could not be included in the computation of the Pennsylvania tax, without violating the commerce clause and the due process and equal protection clauses of the 14th Amendment.

In *State Board of Insurance* v. *Todd Shipyards* (370 U.S. 451), a Texas tax on premiums for in-

surance covering property in Texas was held to be invalid, under the McCarran-Ferguson Act, where the insurers were domiciled in London, England, were not licensed in Texas, and neither did business nor had offices or agents there, and where the insurance was bought and issued in New York, in which state premiums and claims were payable.

Criminal Law.—In *Beck* v. *Washington* (369 U.S. 541), the defendant (David Beck, former Teamsters Union head) had been convicted in a state court of grand larceny from the union of which he was president. The Supreme Court rejected the contention that his conviction violated the due process and equal protection clauses of the 14th Amendment primarily because of voluminous and intensive adverse publicity circulated by news media in the vicinity where he was indicted and tried.

In another case involving a high labor official Maurice A. Hutcheson, president of the United Carpenters, refused to answer questions of a Senate committee pertaining to the alleged improper use of union funds, claiming that the questions were not pertinent to any activity which the committee was authorized to investigate and were asked merely for purposes of "exposure" (*Hutcheson* v. *United States,* 369 U.S. 599). The court upheld his conviction under a statute making it a misdemeanor to refuse to answer questions pertinent to a congressional inquiry, rejecting his claim that his rights under the due process clause of the 5th Amendment were violated because his answers might have been used against him in a pending state criminal trial. In a case arising under the same law, however, the court reversed convictions where the indictments returned by the grand jury merely stated that the questions to which answers were refused "were pertinent to the question then under inquiry" by the congressional subcommittee (*Russell* v. *United States,* 369 U.S. 749). The court held that the indictment must state the question which was under inquiry at the time of the defendant's alleged default or refusal to answer.

In *Lynch* v. *Overholser* (369 U.S. 705), a defendant who had received treatment in a mental hospital was not permitted by the trial judge to withdraw an earlier plea of not guilty, and to plead guilty, to two charges of passing worthless checks. The trial court had then ordered him committed to a mental hospital under a provision of the District of Columbia Code which states that: "If any person . . . is acquitted solely on the ground that he was insane . . . the court shall order such person to be confined in a hospital for the mentally ill." The Supreme Court reversed, holding that this law applied only to a defendant who by his own act had relied on a defense that he was insane when the offense was committed and who had been acquitted on that ground.

In *Chewning* v. *Cunningham* (368 U.S. 443), the court held that in a trial under the Virginia recidivist (habitual criminal) statute, the absence of counsel violated the due process clause of the 14th Amendment because of the complexity of the issues and the potential prejudice to a defendant tried without counsel. In a case arising under the law of West Virginia, however, it was decided that due process did not require advance notice that trial on a substantive offense would be followed by a "habitual criminal" accusation, and that the failure to proceed against other offenders did not necessarily deny equal protection to persons who were prosecuted (*Oyler* v. *Boles,* 368 U.S. 448).

In *Gallegos* v. *Colorado* (370 U.S. 49), it was held that a formal confession signed by a 14-year-old boy, before being brought before a judge and after being held for five days without seeing a lawyer, parent, or other friendly adult, was obtained in violation of due process. His conviction for first-degree murder was reversed. The court also reversed the conviction of an illiterate charged with having committed serious noncapital offenses, where the record failed to show whether he had been offered and had waived counsel, but clearly showed that he was incapable of conducting his own defense (*Carnley* v. *Cochran,* 369 U.S. 506). In a case involving the right of appeal *in forma pauperis,* the court held that an indigent defendant was entitled in all respects to the same right of appeal as one who was able to pay his own expenses, and that the court of appeals erred in dismissing his appeal as not being "in good faith" without hearing oral arguments (*Coppedge* v. *United States,* 369 U.S. 438).

Robinson v. *California* (370 U.S. 600) involved a state law making it a crime punishable by imprisonment for any person to "be addicted to the use of narcotics," even though he had never used or possessed any narcotics within the state. The court held that, as so construed and applied, this law inflicted a cruel and unusual punishment, in violation of the 8th and 14th Amendments. In *Gilbert* v. *United States* (370 U.S. 650), it was held that the endorsement of checks without authority, by a defendant who signed the name of the payee and then his own, as agent, did not constitute "forgery" under the Federal Criminal Code.

Freedom of Religion, Speech, and Press.—In *Engel* v. *Vitale* (370 U.S. 471), the court held that state officials could not compose an official state prayer and require that it be recited in the public schools, even though the prayer was denominationally neutral and even though pupils were not required to recite it or to remain in the room while it was being recited. The decision was based on an interpretation of the 1st Amendment's prohibition against the enactment of any law "respecting an establishment of religion." (See also CIVIL LIBERTIES; EDUCATION.)

In *Wood* v. *Georgia* (370 U.S. 375), a sheriff who was a candidate for reelection issued statements criticizing the action of a county judge in giving a grand jury special instructions to investigate rumors of bloc voting by Negroes and the rumored use of money by political leaders to obtain their votes. The Supreme Court reversed the sheriff's conviction for contempt of court, holding that the record did not support a finding that his statements presented a clear and present danger to the administration of justice, and that his conviction violated his right to freedom of speech guaranteed by the 1st and 14th Amendments.

In *Manual Enterprises* v. *Day* (370 U.S. 478), the court reversed a Post Office ban, under the Comstock Act, against the mailing of magazines consisting largely of photographs of nude or nearly nude male models and containing advertising by photographers offering for sale similar photographs. Refusing to interpret the act as barring from the mails "all material, not patently offensive, which stimulates impure desires relating to sex," the court remarked that such a construction "would doubtless encounter constitutional barriers."

Torts; Workmen's Compensation.—In *Richards* v. *United States* (369 U.S. 1), a suit under the Federal Tort Claims Act for wrongful death as the result of a commercial airplane crash was disallowed, where the accident occurred in Missouri and the plaintiffs attempted to base their suit, under Oklahoma law, on the negligence of the government in enforcing its laws and regulations at the airline's overhaul depot in Oklahoma. The court decided

that Oklahoma law was inapplicable because the injury causing the death occurred in Missouri. In *Calbeck* v. *Travelers Insurance Co.* (370 U.S. 114), the court determined that injuries sustained by employees working on new vessels under construction and afloat on navigable waters were not excluded from the coverage of the Longshoremen's and Harbor Workers' Compensation Act by the fact that a recovery for such injuries could validly be had under a state workmen's compensation law.

In *Vaughan* v. *Atkinson* (369 U.S. 527), a seaman was forced to support himself by working as a taxi driver while an outpatient at a Public Health Service hospital, because of a shipowner's failure to pay "maintenance and cure" (food and lodging) while he was incapacitated. The court held that the seaman was entitled to be paid maintenance and cure without deduction of the amount of his earnings and was also entitled to counsel's fees. In *Morales* v. *City of Galveston* (370 U.S. 165), the court affirmed a judgment in favor of a shipowner against a claim for damages by longshoremen who were injured by fumes from a chemical insecticide, with which wheat being loaded into the ship had been treated. The finding of the trial court, that the absence of forced ventilation in the hold did not make the ship unseaworthy or unfit for service, was found to be reasonable.

Labor Law.—In *Sinclair Refining Co.* v. *Atkinson* (370 U.S. 195), the court held that a suit to enjoin work stoppages, strikes, and picketing, in violation of a collective bargaining agreement containing a no-strike clause and providing for the compulsory arbitration of differences, was barred by the Norris–La Guardia Act. In a related action (*Atkinson* v. *Sinclair Refining Co.*, 370 U.S. 238), the court ruled that Sinclair, in suing the union for damages, could not also collect damages from individual employees who had acted as agents for the union.

In *Marine Engineers* v. *Interlake S.S. Co.* (370 U.S. 173), it was held that a state court could not enjoin peaceful picketing and other activities by unions representing marine engineers on the ground that only "supervisory" personnel were involved, where it was arguable from the evidence that the dispute was within the exclusive jurisdiction of the National Labor Relations Board. In *Drake Bakeries* v. *Local 50 Bakery Workers* (370 U.S. 254), the court held that the issue of damages resulting from a one-day strike must be submitted to arbitration, because it was intertwined with the union's denial that there was any strike or breach of contract. The decision was based primarily on the ground that the contract did not specifically exclude from the arbitration procedures the company's claim for strike damages.

In *National Labor Relations Board* v. *Katz* (369 U.S. 736), the court decided that it was a violation of the duty imposed by the National Labor Relations Act "to bargain collectively," for an employer, unilaterally and without first consulting the union which had been elected as bargaining agent for the employees, to effect a system of automatic wage increases, changes in sick leave benefits, and merit increases, while contract negotiations with the union were being carried on. In *National Labor Relations Board* v. *Washington Aluminum Co.* (370 U.S. 9), seven employees walked out of a machine shop after complaining that it was too cold to work, and were discharged for violating a rule prohibiting any employee from leaving without obtaining the permission of the foreman. The court decided that their discharge violated their right to act in concert for mutual aid or protection, and ordered that they be reinstated.

Section 301(a) of the Labor-Management Relations Act, which permits suits for violations of contracts between employers and unions to be brought in federal district courts, does not divest state courts of jurisdiction over such suits, the court decided in *Dowd Box Co.* v. *Courtney* (368 U.S. 502).

In another case involving the interpretation of section 301(a) of this act, the court decided that the term "contracts" was not limited to collective bargaining agreements concerning hours, wages, and conditions of employment concluded in direct negotiations between employers and unions entitled to recognition as exclusive bargaining representatives of employees, but applied also to agreements (such as a "strike settlement agreement") between employers and unions which importantly and directly affected the employment relationship (*Retail Clerks* v. *Lion Dry Goods*, 369 U.S. 17). Under the same statutory provision, the court held that a strike to settle a dispute which a collective bargaining agreement provided should be settled exclusively and finally by compulsory arbitration, constituted a violation of the agreement, even though there was no explicit no-strike clause in the contract (*Local 174 Teamsters* v. *Lucas Flour Co.*, 369 U.S. 95).

In *In re Green* (369 U.S. 689), a lawyer had advised a union to continue peaceful picketing in disregard of a state court injunction, in order to test whether such injunction interfered with the exclusive jurisdiction of the National Labor Relations Board. The Supreme Court held that the lawyer's conviction for contempt by a state court without a hearing violated the due process clause of the 14th Amendment.

Miscellaneous.—The power of the courts to order reapportionment of seats in a state legislature was upheld in *Baker* v. *Carr* (369 U.S. 186). The plaintiffs sued to redress an alleged deprivation of their federal constitutional rights by a 1901 statute of Tennessee apportioning seats in the General Assembly among the state's 95 counties and the failure of the state legislature to reapportion them, notwithstanding substantial growth and redistribution of the population of the state. The Supreme Court decided that the plaintiff's claim of a denial of the equal protection of the laws, guaranteed by the 14th Amendment, presented a justiciable constitutional cause of action on which they were entitled to a trial and a decision. The case was remanded for further proceedings, with the court withholding an opinion on the substantive aspects of the questions presented.

In *Kesler* v. *Utah Department of Public Safety* (369 U.S. 153), the court upheld Utah's Motor Vehicle Safety Responsibility Act, which requires satisfaction of judgments due to automobile accidents as a condition of the restoration of a driver's license, in spite of the fact that, in the case before it, the appellant had been granted a discharge in bankruptcy under federal law. Pointing out that the state law was "directed towards promoting safety in automobile traffic," the court remarked that its purpose was "wholly unrelated to the purposes of the Bankruptcy Act," and rejected the claim that it was unconstitutional under the supremacy clause because of conflict with that act. In another case involving the supremacy clause, the court held that conflicting provisions of the Texas community property law were superseded by Treasury regulations providing that, when a United States savings bond was registered in co-ownership form (that is, payable to one person *or* another), a surviving co-owner would be recognized as the sole and absolute owner of the bond (*Free* v. *Bland*, 369 U.S. 663).

In *Griggs* v. *County of Allegheny* (369 U.S. 84), aircraft were required to fly regularly and frequently over the plaintiff's residence at very low altitudes in order to land at or depart from a county-owned airport. During these flights, it was often impossible for people in the house to converse or talk on the telephone, and the plaintiff and members of his household were frequently unable to sleep even with ear plugs and sleeping pills. Under these circumstances, the court decided that there was a "taking" of an air easement by the county, for which it must pay just compensation under the 14th Amendment. The court rejected the argument that the airlines or the Civil Aeronautics Administration, acting as an authorized representative of the United States, was the "taker," holding that the county, which was the promoter, owner, and lessor of the airport, was the one who took the air easement in the constitutional sense.

In *Goldblatt* v. *Hempstead* (369 U.S. 590), it was held that an ordinance prohibiting excavation below the water table was not necessarily unconstitutional, even though it prohibited the beneficial use to which property had previously been devoted (that is, mining sand and gravel), and that the depth limitation of the ordinance was not shown to be so onerous and unreasonable as to result in a "taking" of property without due process of law in violation of the 14th Amendment.

In *Glidden Company* v. *Zdanok* (370 U.S. 530), the Supreme Court held that judges of the U.S. Court of Claims and the U.S. Court of Customs and Patent Appeals (including retired judges) could validly serve on United States district courts and courts of appeals by designation and assignment of the chief justice of the United States. The petitioners claimed that they were denied the protection of judges with tenure and compensation guaranteed by Article 3 of the Constitution, which provides in part (Sect. 1):

> The judicial Power of the United States, shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behaviour, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

The court rejected this contention, and held that both the Court of Claims and the Court of Customs and Patent Appeals were "constitutional," rather than "legislative," courts, overruling prior decisions to the contrary.

In *Dairy Queen* v. *Wood* (369 U.S. 469), the owners of the trademark "Dairy Queen" sued for injunctions to restrain the petitioner from using the trademark and for an accounting to determine the exact amount of money owing by the petitioner, claiming that the latter had breached its contract to pay $150,000 for the use of the trademark. The district court refused the petitioner's demand for a trial by jury. The Supreme Court reversed the judgment, holding that the case did not present purely "equitable" issues, and that therefore the petitioner was entitled to a jury trial on the "legal" issue of whether the claim for a money judgment should be granted.

RICHARD L. HIRSHBERG,
Attorney at Law.

LEAD

World mine production of lead (content of ore and concentrate) rose from 2,610,000 short tons in 1960 to 2,660,000 short tons in 1961, an increase of 2%, according to U.S. Bureau of Mines data. World smelter production of lead rose from 2,550,000 short tons in 1960 to 2,660,000 short tons in 1961. According to the International Lead-Zinc Study Group, there was an increase of 67,300 tons in world consumption of refined lead.

In the United States, mine output of recoverable lead increased from 246,669 short tons in 1960 to 261,921 tons in 1961. The United States output was 9% of the world total in 1960 and 10% in 1961. Domestic output of smelter lead rose from 382,000 short tons in 1960 to 450,000 short tons in 1961. The United States output was 15% of the world total in 1960 and 17% in 1961. The four largest lead producing states—Missouri, Idaho, Utah, and Colorado—produced 87% of the national total of lead mined, and 16 other states produced the remainder. Of the 449,565 tons of refined lead produced in 1961, 288,078 tons came from primary sources in domestic ores and base bullion, and 161,487 tons from foreign ores and base bullion, compared with 228,899 tons and 153,537 tons in 1960.

In the first nine months of 1962, output of recoverable lead was 191,743 short tons, compared with 197,435 tons in the same period of 1961.

Consumption of lead in the United States in 1961 totaled 1,027,216 tons, a slight increase over the 1,021,172 tons consumed in 1960. Lead consumption in three of the largest uses increased as follows: batteries, 4%; tetraethyl lead, 4%; and caulking lead, 1%. Of the total lead consumed in 1961, 71% was used in metal products.

United States imports of lead in 1961 totaled 409,402 tons, 14% more than in 1960. Exports were 11,733 tons, more than double those of 1960.

(See also MINERAL PRODUCTION.)

LEATHER. See SHOE INDUSTRY.

LEBANON

The Arab republic of Lebanon is situated in southwestern Asia on the eastern coast of the Mediterranean Sea, bordered by Syria and Israel. It has an area of 4,015 square miles and a population of 1,646,000 (1960 est.), exclusive of 136,561 Palestine refugees. Principal cities and estimated populations: Beirut, the capital and chief port, 500,000; Tripoli, 100,000; Zahle, 40,000; and Saida (ancient Sidon), 25,000. Arabic is the official and principal language; French is widely spoken in the urban centers.

Government.—Lebanon is a unitary state with a centralized government. The executive branch consists of a president (Fouad Chehab, inaugurated on Sept. 23, 1958), elected by the legislature for a six-year term; and a premier and cabinet, appointed and removed by the president but responsible to the legislature. The unicameral legislative body (Chamber of Deputies) has 99 members chosen by universal suffrage for four-year terms. Seats are apportioned among the religious communities on a proportional basis: Maronite, 30; Sunni, 20; Shi'i, 19; Greek Orthodox, 11; Greek Catholic, 6; Druse, 6; Armenian Orthodox, 4; Armenian Catholic, 1; Protestant, 1; and others, 1. Custom requires that the president be a Maronite Christian, the premier, a Sunnite Muslim, and the speaker of the Chamber of Deputies, a Shi'ite Muslim. Political parties are numerous and unstable. Parliamentary elections were last held between June 12 and July 3, 1960.

Education and Religion.—Education is free and nominally compulsory; about 49% of the school-age population are in school. Number of schools (with enrollments), 1960: 2,277 primary (226,558), 246 secondary (39,364), 4 higher (about 4,500). Principal religions: Christian (estimated at slightly over 50%), including Maronite, Greek Orthodox, Greek Catholic, Armenian Orthodox, Armenian Catholic, and Protestant sects; Islam (over 40%), including Sunnite and Shi'ite sects; and Druse.

Finance.—Government revenue and expenditure were balanced in the 1962 budget at 415.8 million Lebanese pounds (£L375 million in the regular budget, compared with £L273.8 million in 1961; and £L40.8 million in the annexed budgets, compared with £L41.2 million in 1961). The Lebanese pound is officially valued at 45.63 U.S. cents; £L2.191 equal U.S.$1 at the official rate, but on July 31, 1962, £L3 equaled U.S.$1 on the free market. Gold and foreign exchange holdings of the Bank of Syria

and Lebanon for the Lebanese accounts: $138.8 million as of Dec. 31, 1961 (up $1.8 million from a year earlier).

Transportation and Communications.—Transport networks (miles, 1960): railways, 254; improved roads, 2,312. Merchant marine (June 30, 1961): 548,000 gross registered tons. Beirut port traffic (1961): passengers, 67,250; freight, 1,641,000 tons. National airlines: Air Liban, Lebanese International Airways, and Middle East Airlines. Beirut International Airport at Khalde is served by 25 foreign airlines. Other communications data, 1960: passenger cars, 46,100; commercial vehicles, 8,100; telephones, 76,670 (1962); radio receivers, 100,000; television sets, 80,000 (1962).

Economic Indicators.—National income (1961): £L1,700 million (£L1,325 million in 1958). Index of wholesale prices (1953 = 100): 102 on Dec. 31, 1959 (101 on Dec. 31, 1958). Cost-of-living index (1953 = 100): 122 on Sept. 30, 1961 (unchanged from Sept. 30, 1960).

Agriculture.—Agriculture engages over 55% of the labor force and produces about 16% of the national income. Some 30% of the land is cultivated. Chief crops (metric tons, 1960–61): oranges, 73,000; lemons, 19,000; apples, 40,000; wheat, 20,000; olives, 38,000; grapes, 30,000; potatoes, 30,000; sugar beets, 16,000; leaf tobacco, 3,500. Milk production (1960): 60,000 metric tons; meat production (1959), 23,000 metric tons.

Manufactures and Minerals.—Mining and manufacturing employ about 11% of the labor force and produce about 14% of the national income. There were 3,744 factories in 1961, representing a total investment of $170 million and employing 43,355 workers. Chief products (metric tons, 1960, unless otherwise noted): cement, 854,000; gasoline, 110,000; kerosene, 72,000; distillate fuel oils, 158,000; residual fuel oils, 343,000; liquified petroleum gas, 7,000; woven cotton fabrics, 5,000 (1957); salt, 13,000 (1959); iron ore, 10,000 (1959); cigarettes, 1,040,000 units (1958); beer, 33,000 hectoliters (1959); electrical energy, 350 million kw.-hr. (of which 150 million was hydroelectric power).

Foreign Trade.—Total exports, 1961: £L418 million (£L218 million in 1960); imports, £L1,050 million (£L854.5 million). Major exports are agricultural products and byproducts (fruits, vegetables, tobacco, hides, and skins), cement, petroleum products, and cut diamonds. Over half of Lebanon's exports are to Middle Eastern countries. Major imports are manufactured goods, fuels, cereal grains, animals for slaughter, and uncut diamonds. The United States is the leading supplier; other major importers include Great Britain, West Germany, France, Italy, and Middle Eastern countries. The heavy unfavorable trade balance is compensated for by remittances from emigrants (£L108 million in 1959), income from tourism (610,934 visitors in 1959), payments for services to the large transit trade through Beirut, and capital investment from the oil-rich neighboring countries.

Events, 1962.—The government of Prime Minister Rashid Karami, which took office in October 1961, moved ahead during 1962 with a program of economic development aimed at reducing Lebanon's excessive dependence on trade and commerce and at strengthening its industrial sector in partnership with a modernized and expanded agriculture. To combat high consumer prices, the government removed the punitive tariffs on Japanese goods, lowered the customs duties on rice, and acted to reduce the price of sugar and of locally produced cigarettes. Plans were pushed ahead for an $11 million expansion of port facilities at Beirut.

On May 20, 1962, the Iraq Petroleum Company announced that it would modernize and enlarge its oil refinery at Tripoli at a cost of about £2.5 million. The work, to be completed within two years, will enable the refinery to produce high-grade gasoline and aviation fuel, and will permit Lebanon to reduce its imports of refined petroleum products. Agreement after six years of discussion was reached on August 7 between the Lebanese government and the Trans-Arabian Pipeline Company, a subsidiary of the Arabian-American Oil Company, concerning royalties and fees in connection with the company's pipeline from Saudi Arabia to Saida. Annual payments to Lebanon for transit fees, loading charges, and protection for the installations was increased from $1.25 million annually to about $4.5 million. A lump-sum payment of $12.5 million was further agreed upon in settlement of prior claims.

Internal peace in Lebanon, which had prevailed since the civil strife of 1958, was broken on the night of Dec. 30–31, 1961, when members of the Nationalist Social Party (or Parti Populaire Syrien) and a small group of officers and soldiers attacked the Ministry of Defense and other key points in Beirut, seeking to effect a political coup. The leaders of the revolt favored a political union of Syria, Lebanon, Jordan, and Iraq and opposed the Arab socialism and pan-Arab nationalism of President Gamal Abdel Nasser of the United Arab Republic. The attempted coup failed and the revolutionists fled; on Jan. 1, 1962, order was restored in Beirut. The Nationalist Social Party was outlawed, and on January 2, loyal Lebanese troops took the rebel stronghold of Dik al-Mahdi in the mountains northeast of Beirut, virtually ending the rebellion. On February 3, with the apprehension of Assad al-Ashkar, former head of the Nationalist Social Party, the government announced that all of the major ringleaders were in prison.

The revolt, in which 27 persons were killed, never attracted mass support. Of the more than 1,500 persons arrested, 700 were resident aliens or visitors, many of them Syrians and Palestinians. On May 9, death sentences were asked for 313 persons (38 soldiers and 275 civilians) in an indictment presented to a military tribunal in Beirut. On September 18, the court sentenced 34 defendants to death (20 in absentia), including Assad al-Ashkar. Of the 309 persons who came to trial, only 16 were acquitted.

In foreign affairs the Lebanese government continued its policy of nonalignment (but of relatively pro-Western orientation) on the world scene, and of good neighborly relations toward all the Arab states. On August 22 the Council of the Arab League met at Shtoura, Lebanon, to consider Syrian charges of interference in Syria's internal affairs by the United Arab Republic (see MIDDLE EAST).

U.S. Attorney General Robert Kennedy paid an unofficial visit to Lebanon on February 20, during an extended world tour. On August 23, U.S. Vice President Lyndon B. Johnson was cordially received in Beirut, which he visited in the course of an official tour of six Mediterranean and Middle Eastern countries.

LEIGHTON, Margaret

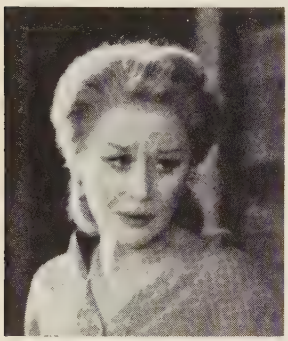
English actress: b. Barnt Green, Worcestershire, England, Feb. 26, 1922.

Twice winner of the American Theatre Wing Antoinette Perry Award, Margaret Leighton received her second "Tony" on April 29, 1962, for her portrayal of the shy spinster Hannah Jelkes in Tennessee Williams' *The Night of the Iguana.* She won her first award in 1957 for the brilliant acting of two contrasting roles in Terrence Rattigan's double bill, *Separate Tables.*

Miss Leighton made her stage debut at the age of 16 with Sir Barry Jackson's Repertory Theatre in Birmingham on Sept. 4, 1938. From this small part in Adelaide Phillpotts' *Laugh with Me,* she advanced to leading roles and, after further experience with Basil C. Langton's Travelling Repertory Company (1941–42), she rejoined the

Birmingham group in plays by Shakespeare, Shaw, and Chekhov. After a successful tryout for the Old Vic Company, she made her London debut as the Troll King's daughter in Ibsen's *Peer Gynt* on Aug. 31, 1944. For the next three years she played leading parts in that company's repertory, opposite such actors as Sir Laurence Olivier and Sir Ralph Richardson. She was first seen in New York on May 6, 1946, as Lady Percy in the Old Vic presentation of Shakespeare's *Henry IV*.

On the London stage she appeared in three roles in James Bridie's *A Sleeping Clergyman* (1947), as Tracy Lord in Philip Barry's *The Philadelphia Story* (1949), as Celia in T. S. Eliot's *The Cocktail Party* (1950), with Richardson and Celia Johnson in a revival of Chekhov's *The Three Sisters* (1951), and in Eliot's *The Confidential Clerk* (1953), before opening in *Separate Tables* (1954). The Rattigan play ran for two years in London and then moved to Broadway with Miss Leighton in 1956. Between her two "Tony" performances, she appeared in Rattigan's *Variation on a Theme* (London 1958), Shakespeare's *Much Ado About Nothing* (New York 1959), John



For her brilliant performance in *The Night of the Iguana*, Margaret Leighton on April 29 was honored with an Antoinette Perry Award.

FRIEDMAN-ABELES

Mortimer's *The Wrong Side of the Park* (London 1960), and Ibsen's *The Lady from the Sea* (London 1961). On Oct. 25, 1962, she opened with critical acclaim in a new Broadway production, Sidney Michaels' *Tchin-Tchin*, based on the play by François Billetdoux.

Miss Leighton has also made numerous motion pictures, beginning with *Bonnie Prince Charlie* in 1948.

LEMNITZER, Lyman Louis

U.S. military commander: b. Honesdale, Pa., Aug. 29, 1899.

Having served as chairman of the U.S. joint chiefs of staff since August 1960, General Lemnitzer succeeded retiring Gen. Lauris Norstad as supreme allied commander, Europe (SACEUR) on Jan. 1, 1963.

A graduate of the U.S. Military Academy (1920), and later of the Command and General Staff School and of the Army War College, Lemnitzer established himself as a skilled negotiator and a conscientious planner during and after World War II. Promoted to brigadier general in 1942, he was given command of the 34th Antiaircraft Brigade. Later that year, as assistant chief of staff (G-3) to Gen. Dwight D. Eisenhower, he planned the amphibious invasion of North Africa, and accompanied Gen. Mark Clark on a clandestine visit by submarine to North Africa before the invasion to persuade the French not to oppose the landings. He participated in the Tunisian and Sicilian campaigns in 1945, and was appointed deputy chief of staff to the supreme allied commander of the Mediterranean Theater. In the same year he took part in the discussion with the German high command in Switzerland that led to the German surrender in Italy and southern Austria.

In the Korean War, Lemnitzer commanded the 7th Infantry Division in 1951–52. Having served as deputy chief of staff for plans and research of the U.S. Army, he was promoted to the rank of general in March 1955 and was named to succeed Gen. Maxwell D. Taylor as commander in chief of the U.S. Far East Command and the United Nations Command in June. Recalled to serve as vice chief of staff of the U.S. Army in 1957, Lemnitzer was elevated to chief of staff in 1959.

General Lemnitzer was nominated on Aug. 15, 1960 to be chairman of the joint chiefs of staff to succeed Gen. Nathan F. Twining on the latter's retirement. Soon after he took office, Lemnitzer became known as an opponent of the single chief of staff proposal. When Gen. Lauris Norstad submitted his resignation as NATO commander in July 1962, President Kennedy named Lemnitzer to succeed him. After the appointment was approved by the North Atlantic Council, Lemnitzer replaced Norstad on November 1 as commander in chief of United States forces in Europe. Because of the impending Cuban crisis, however, Norstad was requested to retain his NATO command until the end of the year, and Lemnitzer assumed that post on Jan. 2, 1963.

LETTUCE. See VEGETABLES.

LIBERIA

Liberia is a small republic (about 43,000 square miles in area) on the west coast of Africa, bounded by Sierra Leone, Guinea, and Ivory Coast. The first census was conducted in April–May 1962; results when announced, will settle population estimates varying widely between 1 and 2 million or more, with about a third of the total living in a 50-mile radius of Monrovia (est. pop., 50,000), the capital. Founded by freed American Negro slaves in 1822, Liberia has maintained close ties with the United States. The descendants of the original American settlers constitute the most influential group and live mainly along the coast. The great bulk of the population are indigenous Africans; about 28 tribal dialects are spoken. Non-Africans (only Africans may acquire citizenship) number about 3,500, about one third Americans. English is the official language.

Government.—Authority is centralized in the national government, organized into three branches: executive, legislative, and judicial. The president and vice president serve 8-year terms and may be re-elected for 4-year terms. President William V. S. Tubman was re-elected in May 1959, and inaugurated Jan. 4, 1960, for his fourth consecutive term. The True Whig Party, led by President Tubman, controls all the seats of the elected bicameral legislature (a 39-member House of Representatives and a 10-member Senate, elected for 4- and 6-year terms, respectively). Opposition parties are not legally barred, but in practice there is no effective political opposition.

Education.—Illiteracy is high, and probably less than 15% of school-age children attend school. In 1961 there were 625 primary and 33 secondary schools attended by 55,157 (primary) and 3,000 (secondary) students. It is estimated that over 60% of the students attend government schools; the remainder, Christian mission or company-operated private schools. (A September–June school year was officially adopted in 1962.) A $6 million project to improve the Monrovia school system was initiated in 1962 with assistance from San Francisco State College. The project involves construction of 5 elementary schools for 2,500 students, a junior high school (1,000 students), and a senior high school (700 students). On Aug. 23, 1962, 90 Peace Corps volunteers flew to Liberia for work in Liberian schools. In May 1962, Cornell University undertook a program, financed by the United States government, to improve the University of Liberia (300 students). A new $20 million university is under study, and progress continues on the National Medical Center (a $5.5 million, 300-bed hospital and medical college).

Finance.—In contrast to the sharp rise in receipts in 1960, government revenue, as a result of lower rubber prices, showed no change in 1961 over 1960, standing at $32.4 million (the U.S. dollar is the principal medium of exchange and is legal tender). Major sources were company income taxes, $6.9 million ($8.9 million in 1960); iron ore royalties, $5.7 million ($6.4 million); and customs duty receipts, $9 million ($7.5 million). Budget figures for 1962 anticipated some improvement in revenue ($34 million), as a result of iron ore expansion, but a sharply expanded capital expenditure program (from $10.7 million in

1961 to $16.8 million in 1962) involved heavy reliance on foreign loans, mostly from the United States.

Transportation and Communications.—There are some 2,300 miles of roads, of which 1,200 miles are all-weather. Motor vehicles registered in 1961 totaled 9,450, an 18% rise over 1960. The only railroad is the 42-mile Liberia Mining Co. line (freight only) running from the Bomi Hills to Monrovia, but additional rail lines were nearing completion in connection with iron ore development projects (see below *Minerals*). Robertsfield, about 50 miles from Monrovia, is an international airport served by 9 international airlines. Internal service is provided by Liberian National Airways.

Partly because of its low registration fees, Liberia has achieved great popularity as a country of registration for foreign-owned merchant shipping. As of Jan. 1, 1962, Liberia was the leading flag of registry for the world's oil tanker fleet (7,015,000 gross registered tons in 1961), and ranked fourth (after the United States, Great Britain, and Norway) in total tonnage (10,929,551). The free port of Monrovia, which in 1961 handled 3,594,000 metric tons of cargo, was much less congested with the coming into operation of the port of Buchanan and completion of port improvements.

In 1962 a $4.4 million telecommunication development project was under way by a Swedish and an American firm. Liberia has 1 daily newspaper and 2 radio broadcasting stations. A powerful Voice of America relay station, situated near Monrovia, is expected to be completed by July 1963 at a cost of $13.8 million, and will be the most powerful transmitter complex in Africa.

Agriculture.—Rubber has now been displaced by iron ore as the major export, but remains very important. Other agricultural export crops are cocoa, coffee, and palm products. Rice and cassava are chief food crops. Forestry resources are huge and largely untapped. In 1961, rubber output was off slightly at 95.3 million pounds, dry rubber content (96.4 million pounds in 1960). The Firestone Plantations Co., with a tapping area of 68,900 acres (plus 18,200 acres in immature rubber), employs about 25,000 Liberians and accounted for 83.5% of the total production; the remaining 16.5% was produced by about 1,000 independent Liberian plantations. The B. F. Goodrich Rubber Plantations Co., which received a rubber concession in 1954, had at the end of 1962 about 12,000 acres cleared and planted, and about 300 acres ready for tapping.

Minerals.—Iron ore development by four companies, involving a capital investment of over $300 million, bids fair to make Liberia a major world producer with an estimated annual production of 20 million metric tons of ore. The Liberian Mining Co. deposits at Bomi Hills produced 3,054,000 metric tons in 1961 and was the sole producer, but the National Iron Ore Co. (Mano River deposits) reached production stage in October 1961. Liberian American Swedish Minerals Company's deposit in the Nimba Mountains, requiring the construction of a new 170-mile railway to and port facilities at Buchanan, progressed in 1962 and was expected to start production in 1963 and to yield 7.5 million tons annually by 1964. The $75 million iron ore project of the Liberian-German Mining Co. (Delimco), near the Bong Hills, made gains in 1962, with completion expected by the end of 1964. A 50-mile railroad from the Bong Hills to Monrovia is under construction.

Foreign Trade.—Largely as a consequence of lower rubber prices, official data for 1961 showed a $20.5 million decline in exports, with total exports valued at $62.1 million. Total imports in 1961 were valued at $90,667,766, an increase of 31% over the $69,190,435 total for 1960. The United States is Liberia's chief trading partner. Leading exports in 1961 were: iron ore, valued at $29.5 million; rubber, $25.5 million; diamonds, $2.2 million; palm kernels, $1.1 million; coffee, $354,613; and cocoa, $234,777.

Events, 1962.—The rising prominence of Liberia in international affairs was reflected in the number of state and official visits to and from the country. Visits by Britain's Queen Elizabeth II and West Germany's President Heinrich Luebke in late 1961 were followed in 1962 by those of Israel's President Izhak Ben-Zvi (August 9–16) and the heads of several African states. President Tubman likewise made several state goodwill visits abroad in 1962—to Israel (June 21–July 1), England (July 10–14), and several Scandinavian countries in September.

On March 28, Liberia became a full member of the International Monetary Fund, International Finance Corporation, International Development Association, and International Bank for Reconstruction and Development. Under auspices of the United Nations Economic Commission for Africa, representatives of 9 African nations met in Monrovia (June 18–22) to consider possibilities of establishment of an African Development Bank.

On June 20, Charles E. Rhetts was appointed United States ambassador to Liberia, as replacement for Elbert G. Mathews, who resigned on April 20.

Bernard Blankenheimer,
Director, Africa Division, Bureau of International Programs, U.S. Department of Commerce.

LIBRARIES

Elementary school libraries, their value and their inadequacy, are prominent in current library development. Foremost among recent contributions to the improvement of these facilities is the $1,130,000 Knapp Foundation grant to the American Association of School Librarians (AASL), a division of the American Library Association and a chapter of the National Education Association. The money will be used to demonstrate the educational value of programs, services, and resources that fully meet the national standards for school libraries.

The director of the Knapp Foundation became interested in this problem when he read a National Library Week article on the dearth of elementary school libraries. In response to his offer, the AASL proposed a five-year program, starting early in 1963 and followed by evaluations every two years, that would establish pilot school libraries and conduct planned programs of teacher training and citizen education through cooperative relationships with nearby teacher education institutions. In addition, the project would provide a national program of information and findings. A national director would be appointed to give leadership and coordination to all aspects of the project.

Intensive use of elementary school libraries is the heart of a three-year experimental project to develop independent study skills for elementary school children. An $88,000 grant from the Ford Foundation's Fund for the Advancement of Education will be used to carry on the project in two Shaker Heights, Ohio, elementary schools.

For the first time, Congress approved an appropriation for an elementary school library program in the District of Columbia schools. Six states established state school library consultant positions in 1962: Delaware, Iowa, Kansas, Oklahoma, Pennsylvania, and West Virginia. Thirty-five states now provide state school library consultant service.

Automation and Technology.—The American Library Association (ALA), with the support of interested companies and publishers, set up the Library 21 exhibit at the Century 21 Exposition (q.v.) in Seattle, Wash. The automated library of the future attempted to provide the public with a new educational experience. The exhibit demonstrated typical library resources that can be treated centrally, stressing the value of interlibrary communication and cooperation, and attempted to integrate machines into an environment of books. New media, such as films, microforms, television, and audio devices, as well as data processing and information retrieval machines, were introduced. The exhibit, located in the Coliseum, included children's and adults' reading areas, a ready reference center, and a learning resources center.

So many libraries have started to use computers that 1962 might be called the year of the computer. The University of Illinois in Chicago, through a grant from the Council on Library Resources, has begun using data-processing devices in library procedures. The University of California at San Diego has programed 700 periodicals in an

Gilbert Chapman (at right), president of New York Public Library, and David Shepard, chairman of the library's fund drive, examine four stacks containing 300 books, the number added to the research facilities every four hours of each working day.

WIDE WORLD

experimental project. The Library of Congress started a feasibility study to determine how a small-scale computer might be used in tabulating operations. The National Aeronautics and Space Administration Scientific and Technical Information Facility provided a completely integrated technical information source for space scientific data.

Four library associations devoted part of their conferences to the applications of automation to libraries. The University of Minnesota Library School invited representatives from industry, government, and libraries to discuss the theoretical and practical considerations of current devices, their relation to traditional library procedures, and the probable lines of future development.

The Library Technology Project, sponsored by the ALA and supported by grants from the Council on Library Resources, in its fourth year published a model insurance policy for libraries; published reports on the evaluation of photocopying equipment and of record players suitable for library use; investigated adhesives suitable for book labeling, protective coatings for microfilms, and equipment for producing full-size copies from microfilm copies; developed a better paperboard for the storage of archival materials and a means to test the strength of library chairs; and designed a new, improved pamphlet box.

Public Libraries.—A year-end nationwide reading survey made by the ALA showed that the mass communications media, especially television, greatly influenced the reading of public library patrons in 1962. The 216 libraries, serving cities of over 50,000 population, reported that the reading emphasis continued its shift from Westerns and light romances to art, travel, education, and national and international affairs.

The latest published statistics for public libraries (for the year 1960) show 8,190 public library systems in the United States. This is an increase of 36% over 1950. Too many libraries are too small, however, to render adequate service as described in the standards of the ALA. While the number of persons included in larger units of service has grown, the number of smaller libraries also has increased. Projections of the Census Bureau indicate that public libraries will have to serve a rapidly growing number of readers, particularly in the age groups 5 to 19 and over 65. This basic problem of providing adequate information service to a rapidly growing population whose intellectual level may depend on its ability to absorb an expanding body of knowledge is accentuated by increased costs and a shortage of trained staff. Expenditures devoted to all public libraries are declining in relation to the nation's total expenditure for social accounts. Total expenditures in the latter category of public funds (federal, state, and local) increased 38% from 1959 to 1960. In the same period, operating expenditures for all public libraries increased only 7.2%, and the ratio of such expenditures to the total cost of public social services declined from 0.7% in 1959 to 0.6% in 1960.

The 254 public library systems serving population areas of 100,000 or more constitute 3% of all public library systems, yet provide service to 44.8% of the total population. The 1960 averages for these systems, derived by dividing the basic data by the 1960 population served, show a decrease in the per capita figures for circulation, book collection, book expenditures, and other operating expenditures. In the library systems serving over 100,000 population, the average per capita circulation was 3.94; books added per capita, 0.09; total operating expenditure per capita, $1.85.

After five years under the Library Services Act, 36 million rural persons in 53 states and outlying areas now have new or improved public library services. There are still 16 million in rural areas, and many more in suburban areas, who are without public library services. State funds for the development of rural public library service have increased by 92% since 1956, while local appropriations have increased by 71%. Greater stress on public library standards has brought about improved quality of public library services and large increases in library usage. The act has been extended to include American Samoa.

Maryland passed a law providing aid to libraries which raised state support for current operating expenses from 10 to 25 cents per capita, with a maximum of 18 to 33 cents per capita in 1963–64.

The Small Libraries Project.—This ALA undertaking, financed by a grant from the Council on Library Resources, helps trustees and librarians of small communities to improve their library services.

In 1962 the project published 16 primary pamphlets and additional supplementary materials on organization of the library and book collection, government, book selection and reference, and services. The state library extension agencies distributed the materials without charge to all public libraries in communities under 10,000 population.

The fourth Dorothy Canfield Fisher Library Award, established by the Book-of-the-Month Club, went to the Jenkins (Ky.) Public Library in 1962. The original award of $5,000 to one library will be expanded in 1963 to a main award of $5,000, nine $1,500 honorable mention awards, and $1,000 to the winner in each of the other 40 states. The funds are given to each library for the purchase of books.

Reading for an Age of Change, a new series of five reading guides which consist of an analysis of a subject by an outstanding authority and an annotated list of books for further reading, was published by the ALA in cooperation with the Public Affairs Committee.

State Libraries.—The Survey of Library Functions of the States, completed in 1962, was supported by a grant from the Carnegie Corporation to the American Association of State Libraries (ASL), a division of the ALA. The most notable feature of the report was the great diversity among the states in organization and quality of service given. It was apparent to the director of the survey that no one form of state library organization would be satisfactory for all states. A committee of the ASL will develop standards based on the findings.

The Society of American Archivists announced an 18-month study of state archival agencies under a grant of $42,000 from the Council on Library Resources, Inc., also leading to standards.

The Nevada State Library received a grant from the Max C. Fleischmann Foundation of Nevada to develop the Nevada Heritage Program, which helps public libraries to develop book collections about Nevada and to increase their use through book lists.

College Libraries.—The Association of College and Research Libraries, a division of the ALA, made grants for books and research to 78 colleges and universities. The program, for improving the quality of library service to higher education through fundamental research in librarianship, was made possible by nine companies and corporation foundations.

The W. K. Kellogg Foundation, Battle Creek, Mich., distributed $360,000 to 36 colleges in 12 states. The money was part of a series of grants totaling $2,500,000 for the purchase of books to improve the quality of teacher education and to increase the effectiveness of college library services.

Librarianship.—The education of librarians continues to be a major concern. In April, the Western Reserve University School of Library Science and the Library Services Branch of the United States Office of Education sponsored an institute for the future of library education. One of the major recommendations was that the ALA develop a sound and imaginative national plan of education for librarianship. The Library Education Division of the ALA prepared a proposal to implement such a plan. Further evidence of the widespread professional concern over the status and future of library education was a conference in Washington in May on the educational needs of librarians and teachers in the administration and use of school libraries as materials centers.

The ALA Committee on Accreditation approved two library schools: the University of California at Los Angeles and Rosary College, River Forest, Ill. In addition, the committee began the first of continuing reviews of the accredited library schools.

The 1961 survey of library school placement revealed once again that there are more positions than graduates, and better salaries than ever before. There were 1,715 graduates from the fifth-year programs of the 32 accredited library schools in the United States and Canada in 1961. The average salary of the United States graduates was $5,365, or $1,282 higher than the 1960 average; however, the range for most of the salaries was $5,000–$5,300 ($200–$100 higher than 1959). Higher salaries and shortages were reported for all types of libraries. The schools reported that 1962 would probably continue this trend.

To help increase enrollment in the library schools, ALA divisions voted to apply the first of the $25,000 annual *World Book Encyclopedia*–ALA Goals Awards to a two-year recruiting project, which seeks to coordinate and stimulate recruiting activities. State libraries and state library associations increased the number and amounts of their scholarships. Pennsylvania hired two full-time recruiters, who work from the two library schools in the state.

Revision of the prevailing rules for author and title entries in cataloging books will be carried on with the aid of a $35,100 grant from the Council on Library Resources, which previously contributed $8,900. Since the revised rules will serve as a guide throughout the English-speaking world, liaison is being maintained with British authorities. The code is being prepared within the framework of the principles agreed upon at the Paris conference of 1961 under the auspices of the International Federation of Library Associations.

Legislation.—On March 20, 1962, five representatives of the ALA were given the opportunity to discuss the role of libraries in the development of the nation with two of President John F. Kennedy's chief advisers. The latter indicated that the administration would give enthusiastic backing to a national program of development for public, school, college, state, federal, and research libraries. As a result, a comprehensive program of federal legislation was proposed and later discussed in committee both by the House and Senate, but time did not permit consideration on the floor before adjournment.

Although Congress authorized the purchase of foreign materials by the Library of Congress in 1954, the first appropriation under this act (P.L. 480) was made in August 1961. Over 200,000 items were purchased in 1962 in India, Pakistan, and the United Arab Republic with American-owned foreign currency. Twenty-one college and university libraries and the New York Public Library received the publications and contributed $10,500 toward the program.

The 1962 Depository Library Act revised the 1895 law by authorizing a limited number of additional depository libraries and increasing the kinds of publications to be made available. A depository library will receive without charge all publications of the government except those required for official or strictly administrative use or classified for reasons of national security.

Library Associations.—The Medical Library Association established a central office in Chicago and appointed Mrs. Helen B. Schmidt as executive secretary.

The American Theological Library Association reviewed the progress of theological libraries under a grant from the Sealantic Fund. Under the program, each library received for books $3,000 from the fund for each $6,000 a year it spent over its norm book budget for the years 1958–61. The total increase in book expenditures in the year

UPI

(*Right*) Former Presidents Herbert Hoover (center) and Harry S Truman (second from left) enter the Hoover Library (*below*) in West Branch, Iowa, for dedication ceremony, August 10.

ending Sept. 30, 1962, was expected to be $432,000.

The Association of Research Libraries announced a grant of $58,350 from the National Science Foundation for partial support of a full-time secretariat to be located in Washington. Dr. James E. Skipper was appointed executive secretary.

Fifth National Library Week.—Held April 8–14, 1962, in some 5,000 communities, this event was both the climax and the starting point for many year-round activities planned to encourage lifetime reading habits, increase the use of libraries, and expand the nation's library resources. National Library Week is a voluntary citizens' movement sponsored by the National Book Committee, Inc., a nonprofit educational group, in cooperation with the ALA. Several hundred organizations and individuals contributed support and financial help.

Some communities reported that National Library Week was a timely reinforcing factor in the realization of long-sought objectives; others that it was the occasion to initiate farsighted programs to improve total library resources. Most rewarding of all, perhaps, was evidence of the cumulative results that this event has helped to achieve from year to year. Both sponsoring organizations decided to continue the program at least through 1967. The Sixth National Library Week will be April 21–27, 1963; its theme: "Reading, the Fifth Freedom—Enjoy It."

International Events.—The 28th session of the International Federation of Library Associations (IFLA) met Aug. 27–30, 1962, in Bern, Switzerland. The Committee on Uniform Cataloging Rules recommended the use of uniform titles for the important anonymous classics, and of official names for the catalog headings of countries. The Sub-Section on Library Work with Children reported that the articles for a book on library service to children in 15 countries had been received and that the section would proceed with the compilation of the international basic catalog of children's books. The Public Libraries Section established a set of principles which would apply equally to the emergent and the highly developed countries. The first of the three principles is: All libraries provided by public funds, irrespective of type, should be obliged to recognize a duty to all the peoples of a country. This means that any citizen of any country should have access to the library resources of his country, whether they are contained in public, research, university, or national libraries, so long as these libraries are maintained by the state or local authorities. Nine other sections and committees reported on progress in their phases of library work.

The Canadian Library Association (CLA), at its 17th Annual Conference in Ottawa, June 24–29, 1962, recommended the establishment of a National Office of Library Service and appointment of a professional coordinator attached to the CLA office. The Canadian government, in its program of austerity, has postponed the building of the National Library.

The West German public library statistics for 1948–59 indicated that the peak year of public library use was 1955. During the decade, the number of libraries grew from 5,252 to 10,500, the number of volumes from 4.7 million to 9.3 million, and circulation from 13 million volumes to 30 million. During the same period, the lending libraries circulated about 600 million volumes. The number of borrowers in the children's departments declined about 6.5%. The percentage of nonfiction borrowed increased in 1960.

The ALA and the U.S. Department of State cosponsored a program for multinational librarians whereby 13 librarians from 10 countries visited the United States for three months in the winter of 1961–62.

Professional librarians are serving with the Peace Corps in Jamaica, Pakistan, and the Philippines. Requests for librarians were received from Africa, Asia, and Latin America.

Buildings.—Again, the expansion of services has meant the construction of new buildings for college and public libraries. Foremost among the structures completed in 1962 are the Texas State Library (Austin) and the National Library of Medicine (Washington, D.C.). Cairo, UAR, reports a new national library, and Ibadan, Nigeria, plans for a new central library, each with expanded services to children and adults.

LIBYA

A federated constitutional monarchy on the Mediterranean coast of Africa, the United Kingdom of Libya has an area of 679,358 square miles and a population of 1,216,000 (est. July 1, 1961). The people are predominantly Arab, of whom about one third are nomads; there are about 35,000 Italians, mostly in Tripolitania. Tripoli (1961 est. pop., 185,517) and Benghazi (Bengasi; 1954 pop., 70,532) are dual capitals; a permanent capital is being constructed at Beida, Cyrenaica. Arabic is the official language.

Government.—Independent since Dec. 24, 1951, Libya is a federation of three provinces—Tripolitania (1954 census pop., 746,064), Cyrenaica (291,328), and Fezzan (54,438)—which exercise considerable autonomy through their respective governors, legislative assemblies, and executive councils. The hereditary monarch is King Idris I (b. 1890; acceded 1951), who appoints the premier and other cabinet ministers; he may introduce or veto legislation and dissolve the lower house of Parliament at his discretion. The Senate consists of 24 members (8 from each province) who serve 8-year terms; the king appoints half the members of the Senate and the provincial assemblies elect the other half. The House of Representatives has 55 members (35 from Tripolitania, 15 from Cyrenaica, and 5 from Fezzan) elected by male suffrage for 4-year terms. The last election took place in January 1960. Premier Mohammed ben Othman Al-Said took office on Oct. 17, 1960. There are no political parties.

Education and Religion.—School enrollment, 1959: 152,061 (35% of the school-age population). Number of schools (with enrollments), 1959: primary, 495 (139,569); secondary, 13 (9,163); teacher-training, 8 (1,902); technical, 8 (856); university, 1 (571). The Libyan College of Advanced Technology, financed by the UN Special Fund, was founded in 1961 to provide 4-year courses in engineering and food processing. Islam is the state religion.

Finance.—Government revenue, fiscal 1962: L£18 million (the Libyan pound equals U.S.$2.80), including L£3.25 million from Great Britain for its leased military bases at Tobruk and Benghazi, and L£3.57 million from the United States for rental of the airbase at Wheelus Field, near Tripoli. Expenditure, fiscal 1962: L£18 million, including L£8.1 million to the provinces, and L£2.17 million to the Libyan Development Council.

Transportation and Communications.—Transport networks (miles, 1962): coastal road from east to west borders, 1,140; other paved roads, 2,400; railroads, 269 (from Tripoli, 168; from Benghazi, 101). Main airports: Idris, near Tripoli, and Benina, near Benghazi, served by 10 foreign airlines. Libyan Airways provides internal air service. Automotive vehicles: 26,900 (1960); telephones, 14,600 (1960); radio receiver licenses, 25,000 (1957).

Agriculture.—Animal husbandry and agriculture engage about 80% of the population, although only 8% of the land is cultivatable. Principal subsistance crops: barley, wheat, dates, and olives (20,000 metric tons in 1961). Principal cash crops: esparto grass, peanuts, citrus fruits, grapes, and almonds.

Industry.—Gross national product, 1960 est.: $172 million (up 61% from 1957). Per capita income, 1961: $150 (or more than double that in 1956). Petroleum production, 1962: 164 wells; 247,160 barrels of oil per day. Coastal fisheries yield sponges, tuna, and sardines. Traditional handicrafts, chiefly rugs and carpets, are produced.

Foreign Trade.—Total exports, 1961: L£7.86 million (up 95% from 1960); imports, L£53.21 million (down 11%). Chief exports were peanuts, esparto grass, goats and sheep, and sponges; principal imports were equipment for oil companies, textile machinery, fuel, timber, chemicals, and foodstuffs. Chief suppliers: Italy, Great Britain, and the United States. Chief customers: Italy, Egypt, and Great Britain. Chief sources of invisible income were expenditures by foreign armed forces and by foreign companies prospecting for oil.

Events, 1962.—On January 29 the cabinet was reorganized, with Wanis Kaddafi becoming foreign minister and Nuri ben Gharsa becoming minister of petroleum affairs. In June, Hamid Ebaidi became minister of development affairs as a result of another cabinet reorganization.

On February 3, 87 persons were sentenced to prison terms ranging from 6 to 32 months for subversive activities against the Libyan government.

The development of petroleum resources continued through the year. It was estimated that about $218 million was invested by foreign companies during 1962 in the petroleum industry. Oil strikes were reported by the Italian company, Ente Nazionale Idrocarburi, in eastern Cyrenaica, and by British Petroleum Ltd. and Nelson Bunker Hunt in southern Cyrenaica. The contract for the first oil refinery to be constructed at Marsa el Brega was awarded to the Chemical Construction Company of New York. On June 4, Libya was admitted to membership in the Organization of Petroleum Exporting Countries (OPEC).

A $38 million port facility and pipeline system was opened in November at Essider, 425 miles east of Tripoli. Its capacity is 313,000 barrels a day from the Dahra oilfields in Tripolitania.

During the year the Libyan Development Council worked on the details of a five-year development plan which was to cost about L£130 million. The emphasis of the plan was on the development of agriculture, the creation of new industries, and the establishment of a fishing fleet. In June an Industrial Development Association was organized to assist private capital investment. The development of cement, sugar, and gas industries was given high priority by the association. Agricultural development was aided by the increase in the capital of the National Agricultural Bank to L£2 million.

J. L. L.

LIECHTENSTEIN

Situated between Austria and Switzerland, the independent Principality of Liechtenstein has an area of 61 square miles and a population (1961 est.) of 17,000. The capital is Vaduz (1959 pop., 3,280). The ruler is Prince Francis Joseph II (b. 1906; acceded 1938), who is assisted by a 15-member elected Landtag. The government is headed by a prime minister (Gerald Batliner, who succeeded Alexander Frick on July 16, 1962). Over 90% of the population is Roman Catholic; German is the official language. In 1960 there were 14 elementary schools with 2,744 pupils. In 1961, estimated government revenue was 13,185,670 Swiss francs; expenditure, 13,221,891. Liechtenstein has a customs union with Switzerland and uses Swiss currency, but issues its own postage stamps. Agriculture, stock raising, and light industry are the major components of the economy.

LIME

Production of lime in the United States in 1961 was 15,193,129 short tons, an increase of 17% over the 12,935,198 tons produced in 1960. Details of the sales and uses of lime are shown in short tons in the following table.

	1959	1960	1961
Sales, total	8,405,509	8,189,336	8,313,424
Quicklime	6,373,027	6,251,373	6,140,827
Hydrated	2,032,482	1,937,963	2,172,597
Uses:			
Agricultural	195,554	186,769	198,357
Building	1,315,346	1,208,630	1,223,709
Industrial	9,010,766	9,590,539	11,788,304
Refractory	1,986,561	1,949,260	1,982,759

(Source: U.S. Bureau of Mines.)

In the first eight months of 1962, the total lime sold was 9,831,251 tons, compared with 8,173,132 tons in the same period of 1961. For the same periods of 1962 and 1961, total sales of agricultural lime were 110,251 tons and 155,603 tons, respectively; building lime, 849,042 tons and 752,854 tons; industrial lime, 7,581,239 tons and 6,072,065 tons; and refractory lime, 1,290,578 tons and 1,192,610 tons.

LITHUANIA

The Lithuanian Soviet Socialist Republic of the USSR is located on the southeast coast of the Baltic Sea. It has an area of about 25,000 square miles, and a population of 2,711,000 (1959), about 61% rural. In 1959, 79% of the population were Lithuanians, an Indo-European people; 8%, Russians; 8%, Poles; and the remaining 5%, mainly Belorussians, Jews, and Ukrainians. Principal cities and populations (1959): Vilnyus (Vilna, Wilno), the capital, 235,000; Kaunas (Kovno), 214,000; Klaipeda (Memel), 89,000; and Siauliai (Shavli), 60,000.

Government.—An independent republic since 1918, Lithuania was forcibly annexed by the USSR in 1940, and reoccupied near the end of World War II. The United States government does not recognize the annexation. Lithuania's legislature is a unicameral Soviet elected for 4-year terms. It rarely meets, and between sessions delegates its authority to a Presidium headed by Yustas I. Paletskis (the nominal chief of state), and to a Council of Ministers (cabinet) headed by Premier Moteyus Y. Shumaukas. The Lithuanian government has no political autonomy, and merely fulfills orders from Moscow. All key government posts are held by members of the Lithuanian Communist Party, headed by First Secretary Antanas J. Snechkus. A large percentage of this party consists of Russians.

Education and Religion.—School enrollment, 1961: 425,000. Number of schools: 1,000 primary; 600 secondary; 72 technical high schools; and 12 colleges. College enrollment, 1961: about 25,000. Principal religion: Roman Catholic. In January 1962, the dean of Klaipeda's Catholic cathedral was sentenced to 8 years' imprisonment, and his vicar to 4 years, for allegedly embezzling church funds.

Finance.—Government expenditure, 1962 est.: 580,431,000 new rubles (545,750,000 in 1961). One new ruble equals U.S.$1.12.

Transportation and Communications.—Transport networks (miles, 1961): railroads, 1,290; roads, 22,200; paved roads, 2,200. Telephones number 30,300.

Manufactures and Minerals.—Major industrial products (metric tons, 1961): peat, 2,082,000; paper, 49,900; cement, 544,000; lumber, 510,000 cubic meters; plywood, 28,800 cubic meters; textiles, 53,500,000 square meters; shoes, 7,800,000 pairs; machine tools, 9,639 units; electricity, 1,296 million kw.-hr. Other manufactures include packaged meat, dairy products, sugar, candy, liquor, machine tools, electrical equipment, port machinery, ships, and farm machines.

Agriculture.—Major crops (metric tons, 1961): milk, 715,800; meat, 191,300; sugar, 151,600; butter, 23,900; fish, 106,900. Sown area: 5,550,000 acres, mostly under rye, oats, wheat, potatoes, flax, sugar beets, and hay. Livestock: cattle, 1,046,000; sheep and goats, 444,000.

Foreign Trade.—Most Lithuanian trade is with the remainder of the USSR. Chief exports: bacon, meat, linen, wood products, machines. Main imports: coal, petroleum, ferrous metals, timber, grain.

Events, 1962.—The living standard remained low, and the Communist press admitted widespread shortages of clothing, furniture, and shoes. The acute scarcity of urban housing continued. The press continued to complain about such attitudes among the Lithuanian population as desire for national independence, respect for Western art, fondness for private farming, belief in religion, and anti-Sovietism. In June, Juozas Streikus, leader of an anti-Soviet guerrilla band operating in rural areas, was sentenced to death. Because of the anti-Communist attitude of much of the Lithuanian

Sophia Loren (l.) won 1962 Academy Award for her role in *Two Women;* she is seen here with Eleanora Brown in a scene from film.

EMBASSY PICTURES

population, the USSR maintained a large army of occupation in the country, the soldiers mainly Russian or of other non-Lithuanian nationality. Lithuanian youths drafted into the USSR armed forces were usually sent to other Soviet areas to serve their conscription periods.

ELLSWORTH RAYMOND,
USSR Area Specialist and Associate Professor of Government, New York University.

LOREN, Sophia

Italian motion picture actress (original name: Sophia Scicolone): b. Rome, Italy, Sept. 20, 1934.

The only performer in a foreign-language film ever so honored, Sophia Loren was named the best actress of 1961 on April 9, 1962, by the Motion Picture Academy of Arts and Sciences for her portrayal of the indomitable Italian mother in *Two Women* (1961). On Dec. 28, 1961, she had been honored by the New York Film Critics Circle as the top film actress of the year for the same role.

Sophia Loren's childhood was passed in the midst of poverty and war in Pozzuoli, an industrial suburb of Naples, Italy. After attending a Catholic parochial school, she studied in the local teachers' institute for three years. In 1949 she won second place in a Naples "Queen of the Sea" beauty contest. She then went with her mother to Rome, where she worked first as an extra in *Quo Vadis* (1951) and subsequently as a model and an actress in minor film roles. When she became the female lead in a semi-documentary Italian film, *Africa Under the Sea,* she adopted the name of Loren. In 1951 she starred in *Aida,* and her reputation grew with her appearances in more than 20 Italian films which followed, in the last of which, *The Luck of Being a Woman* (1955), she played opposite Charles Boyer.

Miss Loren played her first American motion picture role with Cary Grant and Frank Sinatra in *The Pride and the Passion* (1957), filmed in Spain. She made three other American films in Europe before she arrived in Hollywood in 1957. In the same year she was married (in a proxy ceremony in Mexico) to Carlo Ponti, an Italian film producer.

Among the films in which she has since starred are *The Gold of Naples* (1957), *Desire Under the Elms* (1958), *Houseboat* (1958), *The Black Orchid* (1959), *That Kind of Woman* (1959), and *Breath of Scandal* (1960), which cast her in a series of rather unimpressive roles, though she won an acting trophy from the Venice International Film Festival for her performance in *The Black Orchid.*

LOS ANGELES

The nation's second largest metropolis in area (458 square miles), Los Angeles, Calif., is the third most populous city in the United States, with an estimated 2,537,000 inhabitants as of July 1, 1961. The total population of Los Angeles County (Oct. 1, 1962) is 6,453,174. The Los Angeles metropolitan area (4,842 square miles), comprising Los Angeles and Orange counties, reached a population of 7,275,824 in July 1962.

The City of Los Angeles is governed by a mayor (in 1962, Samuel W. Yorty) and an elective 15-member City Council. Budgetary appropriations for the 1962–63 fiscal year totaled $255,604,272, distributed by function as follows: protection to persons and property, $121,715,941; highways, bridges, and structures, $53,182,431; health and sanitation, $33,531,033; culture and recreation, $19,750,293; general government, $21,487,420; and miscellaneous, $5,937,094.

Major sources of city revenue included property taxes, $107,063,654; sales taxes, $45,800,000; and licenses, permits, and fees, $21,259,000. Three proprietary departments have separate budgets: Water and Power, $297,990,518; Harbor, $24,600,100; and Airport, $19,616,440. The city tax rate for 1962–63 was $1.99 per $100 assessed valuation.

The County of Los Angeles, which includes the City of Los Angeles as well as a score of other cities, is governed by a Board of Supervisors. The Los Angeles County budget for 1962–63 totaled $668,892,522, distributed by function as follows: public assistance, $354,574,625; protection to persons and property, $99,279,471; roads, $55,069,351; general government, $118,024,159; health and sanitation, $13,047,784; and culture and recreation, $11,472,201. Major sources of revenue included: property tax, $270,709,987; sales taxes, $6,350,000; charges for current services, $48,496,562; and aid from other government agencies, $256,541,322.

The county tax rate for 1962–63 was $2.20 per $100 assessed valuation. The assessed valuation for Los Angeles County's tangible property was $13,021,969,265.

In January 1962, two major Los Angeles newspapers went out of existence. The Los Angeles *Mirror* ceased publishing and the *Examiner* was absorbed by the *Herald Express,* leaving Los Angeles with only one major morning and evening newspaper. On October 1 the New York *Times* began publishing a west coast edition, which proved to be an immediate success. (See also NEWSPAPERS.)

Among other major Los Angeles developments in 1962 was the development of an urban renewal program in the area known as Bunker Hill, adjoining the Civic Center. The land is to be sold to developers to construct a high-rise building complex. The city also has been considering a multimillion-dollar Community Renewal Program. A three-year federally sponsored study was under way to catalogue the physical conditions of every sector of the city as the basis for a citywide master plan for land use and slum prevention.

Planning was also under way for development of a rapid transit network to serve the heavily congested downtown area of Los Angeles. The system will take the form of a subway linking the freeways at the outer circumference with the heavily congested downtown area and Wiltshire Boulevard. Freeway construction continued in all areas of the city. The building fund for construction of a Music Center for the Performing Arts neared its goal, and construction was imminent.

With passage of the $270 million college and university building bond in November, construction was begun of a new branch of the University of California to serve the greater Los Angeles metropolitan area. Located on a portion of the famed Irvine Ranch in Orange County, the new campus will match the University of California at Los Angeles, and serve approximately 25,000

students. Expansion of the state colleges in the Los Angeles area also was provided for in the bond issue.

The Los Angeles Dodgers opened the baseball season in the 56,000-seat Dodger Stadium, at Chavez Ravine. However, the handsome new ball park failed to bring any good fortune to the Dodgers, who lost to the San Francisco Giants in a postseason playoff for the National League pennant.

DAVID S. MCLELLAN,
Associate Professor of Political Science, University of California, Riverside.

LOUISIANA

A South Central state of the United States, Louisiana ranks 31st among the states in area (land, 45,106 square miles; inland water, 3,417) and 20th in population (3,330,000 on July 1, 1962, a 2.2% increase from the 1960 census figure of 3,257,022). Urban places with populations above 15,000 in 1960:

Alexandria	40,279	Kenner	17,037
Bastrop	15,193	Lafayette	40,400
Baton Rouge (*capital*)	152,419	Lake Charles	63,392
Bogalusa	21,423	Monroe	52,219
Bossier City	32,776	New Iberia	29,062
Crowley	15,617	New Orleans	627,525
Goosport[1]	16,778	Opelousas	17,417
Gretna	21,967	Shreveport	164,372
Houma	22,561	West Monroe	15,215
Jefferson Heights[1]	19,353		

[1] Unincorporated.

Government.—Chief executive and judicial officers in 1962 included James H. Davis (Democrat), governor, serving a four-year term; C. C. Aycock, lieutenant governor; Wade O. Martin, Jr., secretary of state; A. P. Tugwell, treasurer; Roy R. Theriot, comptroller; Jack P. F. Gremillion, attorney general; Shelby M. Jackson, superintendent of public education; and John B. Fournet, chief justice of the 7-member Supreme Court.

The Louisiana Legislature, which convenes annually, comprised 39 Democrats in the Senate in 1962 and 105 Democrats in the House of Representatives.

Legislation, 1962.—The regular 60-day session convened on May 14 and adjourned on July 12. The commission created in 1960 to study the entire state government reported to the Legislature and sponsored 45 bills, 12 of which dealt with reorganization of administration. The creation of a new auditing agency in the legislative branch, the abolition of four agencies in the executive branch, and authorization for the governor to succeed himself were recommended.

The most pressing problem before the Legislature was financial. The $80 million operating deficit for the fiscal year ending June 30, 1962, was provided for in part by a $60 million bond issue and by transferring $10.5 million of accumulated surpluses to the general fund (see below, *Events, 1962*). For the state's grants-in-aid to segregated schools, a $20 million bond issue was approved. Responsibility for distributing allocated funds to local school systems was transferred from the state Board of Education to the Legislature.

Bills to establish a code of ethics for public officials and to make the state payroll available to the members of the Legislature failed to pass. The $60 million highway bond issue proposed by the 1961 Legislature was submitted to the electorate on Nov. 6, 1962, and was approved.

Finance.—In the 1961 fiscal year, revenue of $765,241,725 included $478,756,978 from state taxes and $200,866,606 in federal funds. Chief tax yields were the 2% general sales tax ($85,356,510), a severance tax ($147,064,958), and taxes on gasoline ($61,314,005) and income ($34,218,477). Spending of $752,471,743 included $262,992,182 for education, $167,177,501 for public welfare, and $151,139,169 for highways. (See above, *Legislation, 1962*, and below, *Events, 1962*.)

Education.—In the 1960–61 school year, public elementary schools staffed by 15,806 teachers enrolled 542,400 pupils; secondary schools with 10,233 teachers enrolled 158,323; and private and parochial schools with 3,621 teachers enrolled 138,369. Enrollment in colleges and universities totaled 62,312.

Estimated public school spending in the 1961–62 school year totaled $322.8 million, including current expenditures of $260 million ($398 per pupil) and capital outlays of $50 million. Revenue of $352,883,000 was drawn chiefly from state funds ($209,383,000) and local districts ($76,500,000). Teachers' salaries averaged $5,075 (high school, $5,350; elementary, $4,910). Actual spending for higher education (1961 fiscal year) totaled $72,349,000.

Public Assistance.—In the 1961 fiscal year, public assistance to a monthly average of 180,000 persons totaled $146,006,534. This amount included $103,809,140 for the aged and $24,117,124 for dependent children.

Transportation and Communications.—A total of 701 miles of highway construction and reconstruction was completed in the 1962 fiscal year. *Highways and roads* on Dec. 31, 1961, totaled 49,307 miles (41,200 surfaced). These served 1,243,500 *motor vehicles* (as registered on July 31, 1962), including 944,355 automobiles. Operating in the state in 1962 were 30 *railroads* (using, in 1960, 3,937 line miles of track); 12 regularly scheduled *airlines;* and 60 commercial and municipal *airports and airfields.*

Communications media included (1961) 79 AM and 8 FM *radio stations;* 12 *television stations;* 19 *newspapers* (circulation, 731,820); and (Jan. 1, 1962) 286,000 business and 822,000 residential *telephones.*

Labor Force.—The state's labor force on July 15, 1962, included 108,200 agricultural workers. Nonagricultural employment totaled 778,100, compared with 778,500 a year earlier and an average of 779,900 for the full year 1961. Of nonfarm employees, 22.8% were in trade, 19.1% in government services, and 17.7% in manufacturing. Unemployment on July 15, 1962, was down to 69,700 from the 93,300 reported for the previous July 15.

Manufacturing.—Covered employment in Louisiana manufacturing establishments averaged 133,712 on Dec. 31, 1961, and provided a payroll of $678,101,936.

MAJOR LOUISIANA MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Total	133,274	$651,185	$1,563,297
Chemicals and products	15,636	105,539	377,807
Food and kindred products	30,697	118,311	294,433
Petroleum and coal products	12,629	91,893	232,274
Paper and allied products	16,926	90,343	189,315
Primary metals	3,613	22,515	94,547
Stone, clay, glass products	6,562	30,471	74,650
Lumber and wood products	16,010	44,451	67,143

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Louisiana ranked second among the states in the value of its mineral output for the fourth successive year, with 11.99% of the national total. It was first in output of salt; second in natural gas, petroleum, and sulfur (Frasch). Sulfur output increased 4.5%, due chiefly to the working of a big offshore mine for the first full year.

LOUISIANA MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Clays	645,000	$ 645,000
Lime	927,000	11,893,000
Natural gas (million cu. ft.)	3,271,857	611,837,000
Natural gasoline (1,000 gal.)	931,176	61,714,000
Petroleum (1,000 bbl.)	424,962[1]	1,339,905,000[1]
Petroleum gases (1,000 gal.)	806,559	33,214,000
Salt, common	4,722,000	23,357,000
Sand and gravel	12,402,000	14,833,000
Stone[2]	4,641,000	7,656,000
Sulfur, Frasch (long tons)	2,352,000	55,164,000
Other minerals	...	15,807,000
Total	...	$2,173,442,000[3]

[1] Preliminary. [2] Excludes certain stone, value for which is included under "Other minerals." [3] Total adjusted to avoid duplication in the value of raw materials used in manufacturing cement and lime. (Source: U.S. Bureau of Mines.)

Fisheries.—The state's commercial fish and shellfish catch in 1961 totaled 643,113,480 pounds, up 14% from the 1960 total. Leading species were shrimp (30,998,441 pounds), menhaden (581,682,610), and oysters (9,891,337).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $259,707,000, compared with $207,588,000 for the corresponding period of

1961. For the full year 1961, income comprised $154,013,000 from livestock, $249,424,000 from crops, and $16,490,000 in government payments. Principal income sources in 1961 were cattle, $75,889,000; cotton lint, $75,493,000; rice, $67,437,000; sugarcane for sugar, $45,992,000; and wholesale milk, $41,911,000.

The state's 74,000 farms in 1959 had an acreage of 10,347,000 (2,426,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,818,000 cattle, 3,701,000 chickens, and 24,935,000 commercial broilers. An average of 92,000 family and 64,000 hired workers were engaged in farming during 1961.

LOUISIANA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Corn for grain (1,000 bu.)	12,107	9,879	6,216
Cotton lint (1,000 bales)	570	479	545
Cottonseed (1,000 tons)	234	200	230
Pecans (1,000 lb.)	16,830	36,000	6,000
Rice (1,000 bags)	12,723	13,396	15,494
Soybeans (1,000 bu.)	2,426	4,728	4,818
Strawberries (1,000 lb.)	18,551	14,960	17,160
Sugarcane for sugar (1,000 tons)	5,250	7,118	5,350
Sugarcane sirup (1,000 gal.)	2,508	2,135	1,632
Sweet potatoes (1,000 cwt.)	4,473	3,604	3,410

(Source: U.S. Department of Agriculture.)

Events, 1962.—Deficit spending by the state government continued to be a major concern, but an austerity program was not followed. A $60 million bond issue to liquidate part of the $73 million deficit for the fiscal year ending June 30 was a temporary palliative. The budget adopted for the next fiscal year was expected to run a deficit of $15 million. In November the Legislature approved an expenditure of $1 million for a recreation area at Cyremort Point, 35 miles south of New Iberia. The new $1.5 million governor's mansion was ready for occupancy at the end of the year; the old one had been built in 1930. Criticism was leveled at 18 legislators who were to receive $87,000 annually in commissions on insurance policies purchased by the state.

Louisiana and the federal government continued to disagree about the ownership of the tidelands, the zone from 3 to 10 miles offshore. In November, 14 tracts in the zone were offered for lease, attracting $44.4 million in bids. In escrow, awaiting judicial disposition, was a total of $450 million. The state expected all or part of these funds to solve its financial difficulties.

A New Orleans woman, one of three persons excommunicated for continued resistance to school integration, kneels in front of Archbishop Joseph Rummel, April 17, and asks God to forgive him for his order desegregating parish schools.

WIDE WORLD

In the Democratic primary on July 28, Rep. Hale Boggs, the House majority whip, won easily over three other candidates; his victory was interpreted as a significant endorsement of the Kennedy administration. Sen. Russell Long was renominated by a 4 to 1 margin, and his cousin, Gillis Long, defeated Rep. Harold McSween in the closest race of the primary. No September runoff primaries were necessary for Democratic congressional candidates, all of whom won in the November election.

A federal judge certified 26 Negroes of East Carroll Parish as qualified to vote in the state Democratic primary. They were the first of their race in the parish in 40 years to be enfranchised.

Southern University, the nation's largest Negro university, continued to feel reverberations from the antisegregation demonstrations conducted by its students at nearby Baton Rouge in December 1961. Rioting took place at the university on Jan. 16, 1962, after seven students who had been arrested for participating in the Baton Rouge demonstration were expelled. The university was closed down two days later, the last day of the term, and all of the nearly 5,000 students were required to apply for admission for the term beginning January 29. The applications of the expelled students, and some 40 others, were rejected. The Congress of Racial Equality (CORE), the sponsor of the Baton Rouge demonstration, initiated a boycott of the university, which failed, and CORE was prohibited by a U.S. District Court injunction from staging further demonstrations in the Baton Rouge area.

On March 27 it was announced that the archbishop of New Orleans had ordered the desegregation of more than 150 Roman Catholic schools in southeastern Louisiana. Three weeks later he excommunicated three of the most vociferous opponents of the ruling. Segregationist sentiment focused on the first parochial school to integrate, at Buras, on August 29, as 5 Negro and 44 white students appeared for the first classes. Under mounting pressure, all of the students eventually dropped out. On September 4 there were also disturbances at Westwego, a suburb of New Orleans, but elsewhere Negroes attended 30 previously all-white parochial schools without major incident.

"Legislation" and "Events" by: G. W. McGINTY, *Professor of History; Head, Department of Social Sciences, Louisiana Polytechnic Institute.*

LUMBER

The lumber industry in the United States continued in a depressed condition in 1962, after its total production in the preceding year had reached the lowest point since World War II. A number of the smaller Pacific coast mills closed down, and unemployment in the industry in the Western states was estimated at more than 2,500. The industry's difficulties were attributed in part to reduced demand due to a high price level in competition with other building materials, although the price level failed to yield returns adequate to offset a persistent rise in production costs. Another factor was increasing competition from imports, especially softwood lumber from British Columbia. A law restricting coast-to-coast shipments to American vessels gave Canadian producers an advantage in lower shipping costs. A request by lumber industry spokesmen that the United States government impose a temporary quota on Canadian imports was not granted, but United States officials began a series of talks with Canadian officials on lumber industry problems.

Lumber production in the United States in 1961 decreased 8% from the preceding year's figure. The National Lumber Manufacturers Association's preliminary estimate for 1961 was 31,694 million board feet; the revised estimate for 1960 was 34,494 million board feet, and for 1959, 37,373 million. Production in the first half of 1962 was estimated at 16,308 million board feet, 4% higher than the 15,678 million during the first six months of 1961. United States production of lumber in 1961 (with 1960 figures in parentheses) included 27,079 million board feet of softwoods (28,334), consisting principally of Southern pine, 6,461 million board feet (6,572); Douglas fir, 7,754 (8,347); Western pine, 8,687 (8,967); and California redwood, 2,254 (2,750). Production of hardwoods amounted to 4,615 million board feet (6,160).

United States imports of lumber in 1961, according to the U.S. Department of Commerce, totaled 4,248 million board feet—4,004 million feet of softwood lumber, 242 million feet of hardwood, and about 2 million feet of sawed railroad ties. Spruce, Douglas fir, fir, and hemlock lumber from Canada accounted for most of the imports. During 1961, imported lumber represented 12% of total United States consumption, compared with 10% in 1960. United States exports totaled approximately 755 million board feet—596 million feet of softwood and 119 million feet of hardwood lumber, 40 million feet of ties, and less than 1 million feet of box shooks.

The wholesale price index for lumber, according to the Bureau of Labor Statistics, dropped from an average of 99.8 for 1960 to 94.7 for 1961 (1957–59 = 100). By June 1962 the index figure was 97.6. The highest year on record was 1956, with an average index of 104.6.

The most recent Census of Manufactures (1958) showed 5,884 plants with 20 or more employees in lumber and related products manufacture (excluding furniture) in the United States. Capital expenditures for new plant and equipment in 1960 were $317 million. Employees in 1960 numbered 596,000, including 526,000 classed as production workers. Man-hours worked by production workers totaled 1,020 million; wages, $1,765 million.

World Production.—Estimated world production of sawed wood reached a new record level in 1960 of more than 330 million cubic meters, according to the Food and Agriculture Organization of the United Nations. Of the total production, 263 million cubic meters was of coniferous or softwood species, and 67 million of broadleaved or hardwood species (1 cubic meter = 424 board feet).

The Soviet Union, which became the world's leading producer of sawed wood in 1957, continued in first place in 1960 with 106 million cubic meters, or 32% of the world output. Other most important producers were the United States with 81.9 million, Japan (26.7 million), Canada (18.3 million), and Sweden (8.6 million).

LUTHERAN CHURCHES

Four Lutheran churches in the United States merged in 1962 to form the 3,200,000-member Lutheran Church in America. The new church is composed of the former United Lutheran Church in America (2,509,000 members), the Augustana Lutheran Church (630,000 members), the American Evangelical Lutheran Church (25,000 members), and the Finnish Evangelical Lutheran Church (Suomi Synod, 36,000 members). Dr. Franklin Clark Fry, president of the United Lutheran Church in America and of the Lutheran World Federation, was elected president of the new body at a constituting convention in Detroit, Mich., June 28–July 1, 1962. Dr. Malvin H. Lundeen, president of the Augustana Church, was named secretary.

Another merger was assured as the 90,000-member Lutheran Free Church voted to join the American Lutheran Church (2,400,000 members), which was formed in 1960 by the union of three Lutheran groups. The issue had twice previously been considered by the Lutheran Free Church, each time without sufficient support from the membership.

The American Lutheran Church, headed by Dr. Fredrik A. Schiotz, held its biennial convention in Milwaukee, Wis., October 18–24, 1962, and voted overwhelmingly to continue its membership in the World Council of Churches. An ultraconservative group within the church had attacked continued membership in the world body.

The 2,600,000-member Lutheran Church-Missouri Synod at its triennial convention in Cleveland, Ohio, June 20–29, 1962, elected a new president for the first time since 1935. Dr. John W. Behnken, 78, who had served 9 three-year terms as president, declined re-election and was named honorary president. Dr. Oliver R. Harms, one of the synod's four vice presidents, succeeded him.

The three major Lutheran churches, comprising 95% of the Lutherans in the United States and Canada, declared that sufficient doctrinal consensus existed among them to justify consideration of the formation of a new cooperative agency for theological study and Christian service. This agency would replace the 44-year-old National Lutheran Council, the service arm of the eight church groups that merged into the Lutheran Church in America and the American Lutheran Church. The Missouri Synod has not been a member of the council, although there have been cooperative relationships.

Total Lutheran baptized membership in 1962 was reported as 8,333,797 in the United States and 277,271 in Canada. Of the increase of 154,205 members since 1961, half was in the Missouri Synod.

PHILIP A. JOHNSON,
Executive Secretary, Division of Public Relations, National Lutheran Council.

LUXEMBOURG

Situated in western Europe between Belgium, France, and West Germany, the Grand Duchy of Luxembourg has an area of 998 square miles and a population (1961 est.) of 319,000. The capital and chief city is Luxembourg (1959 pop., 71,612). French is the official language; Luxembourgian (a German-French-Dutch admixture) is the principal spoken language.

Government.—Luxembourg is a constitutional monarchy headed by Grand Duchess Charlotte (b. 1896; sovereign since 1919), who on May 2, 1961, delegated to her son, Prince Jean, all political and juridical prerogatives of the sovereign. Legislative power is vested in a 52-member Chamber of Deputies, elected by universal suffrage for a 5-year term. Following the elections of Feb. 1, 1959, party seating in the legislature was as follows: Christian Social, 21 seats; Socialist, 17; Democratic (Liberals), 11; and Communist, 3. Executive power is vested in a cabinet, headed by a prime minister (Pierre Werner, since Feb. 26, 1959).

Education and Religion.—Education is compulsory for all children between the ages of 6 and 13 years. Number of schools (with enrollments), 1960: 433 primary (29,903); 7 secondary (4,510); 4 technical (3,621); and 2 teacher-training (105). More than 90% of the population is Roman Catholic.

Finance.—Estimated government revenue, 1962: 6.1 million Luxembourg francs; expenditure, 6.2 million (49.86 Luxembourg francs equal U.S.$1).

Transportation and Communications.—Transport networks (miles, 1961): state roads, 1,743; local roads, 1,475; railroads, 244. Other communications data: passenger cars, 41,581 (1961); trucks, 9,029 (1961); telephones, 51,364 (1960); licensed radio receivers, 98,000 (1960); television sets, 10,500 (1962). Findel is the country's airport.

Manufactures and Minerals.—The iron and steel industry accounts for over half of Luxembourg's industrial employment, provides about two thirds of total industrial output, and contributes the greater part of annual exports. Chief products (metric tons, 1961): iron ore, 7,457,941; pig iron and ferroalloys, 3,828,000; crude steel, 4,112,783; chemical fertilizers, 732,324 (in 1960); electricity, 1,507 million kw.-hr. The index of industrial production (1953 = 100) rose from 139 in 1960 to 141 in 1961.

Agriculture.—Agriculture occupied 17% of the active population in 1960. Chief crops (metric tons, 1960): wheat, 44,633; oats, 38,789; barley, 17,731; potatoes, 102,989; and fodder beets, 193,648. Wine production in 1961 totaled 108,500 hectoliters. The consumer price index (1953 = 100) was 108 in 1961, the same as in 1960.

Events, 1962.—The economic downturn begun in late 1961 continued into 1962, but a general upturn was registered in midyear. Industrial production in the first six months of 1962 declined slightly below comparable levels in the same period of the previous year. Production decreases were most marked in the chemical, textile, lumber, tobacco, and beverage industries; gains were registered in food products, certain minerals and metals, and furniture. Employment increased moderately as the result of an influx of foreign workers.

A treaty of friendship between Luxembourg and the United States was signed on February 23. William R. Rivkin succeeded James Wine as United States ambassador to Luxembourg on November 19.

MACMILLAN, (Maurice) Harold

Prime minister of Great Britain: b. London, England, Feb. 10, 1894.

Prime Minister Macmillan's principal policy objective—full British membership in the European Economic Community (Common Market), with safeguards for the special interests of the Commonwealth—was beset with difficulties in 1962.

Educated at Eton and at Balliol College, Oxford (B.A., 1919), he was a director of Macmillan and Company, Ltd. (1920–40). A Conservative member of Parliament (1924–29; 1931–45), he served as resident minister in North Africa (1942–45) and secretary of state for air (1945). Reelected to Parliament in 1945, he served as minister of housing and local government (1951–54), minister of defense (1954–55), secretary of state for foreign affairs (1955), and chancellor of the exchequer (1955–57), before succeeding Sir Anthony Eden as prime minister on Jan. 10, 1957.

From West German leaders in Bonn on Jan. 9, 1962, and from Italian leaders in London on January 17, Macmillan received assurances of continued support for Britain's entry into the Common Market and sympathetic understanding of the problem of the Commonwealth countries. In Britain, however, opposition to membership increased, threatening to cause a split in the Conservative Party. The need for party solidarity became apparent when the Conservatives suffered reverses in by-elections in March and April, largely because of dissatisfaction among Conservative voters with government economic policies.

Arriving in New York on April 27 en route to conferences with President Kennedy and Canadian Prime Minister Diefenbaker, Macmillan delivered a major address in which he expressed the objectives and hopes underlying his Common Market policy: "Our present negotiations in Brussels are directed towards a plan by which Britain may be able to do her double duty, as both a Commonwealth and a European country. If this problem can be solved—and I believe it can—then indeed the forces of civilization and order will be strengthened and encouraged."

Time became an increasingly important element in Macmillan's plans. A swift and successful conclusion to the negotiations would enable him to silence his critics in Parliament, the Conservative Party, and the country at large. Delay only added to his difficulties. Rumors persisted that French President de Gaulle was continuing to place obstacles in the way of British membership. A Macmillan-de Gaulle meeting on June 3 apparently showed an identity of purpose between the two leaders, but two days later in the House of Commons the British leader found it necessary to reassure the chamber that de Gaulle's subsequent statements were not really expressions of hostility.

A by-election held on July 12 showed another loss of Conservative strength. On the following day, Macmillan announced cabinet changes described as the "most sweeping Government reconstruction in modern times." Seven cabinet ministers were replaced, including Chancellor of the Exchequer Selwyn Lloyd, along with more than 24 ministerial officials. Soon after, Macmillan demonstrated continued control over his party when a

Labour censure motion against the reorganization was defeated in the House of Commons. Significantly, every Conservative MP voted in support of the prime minister.

Macmillan had hoped to present to the conference of Commonwealth prime ministers in September arrangements for Britain's entry into the Common Market, but no agreement had been reached. Both at the conference and in a radio-television report to the British people a week later, the prime minister spoke out bluntly, citing the growing strain on Britain's trade and stating that the Commonwealth could not provide an economic alternative to the Common Market. (See also COMMONWEALTH OF NATIONS.)

Macmillan's difficulties continued throughout the year. Conservative losses in the fall by-elections indicated continued dissatisfaction among the British people. Further delays in the Common Market negotiations led Macmillan to meet again with de Gaulle (December 15–17) in an apparently unsuccessful effort to eliminate the obstacles. New difficulties emerged when, late in the year, the United States announced the impending cancellation of the Skybolt missile program (see also MISSILES). The Macmillan government had halted work on Bluestreak, Britain's own air-to-ground missile, with assurances that the Skybolt would provide a more effective weapon at much less cost. The Skybolt issue dominated the meeting between Macmillan and President Kennedy at Nassau on December 18–21, when the prime minister agreed to accept the already operational Polaris instead of the Skybolt, possibly as part of a future integrated NATO nuclear force. The agreement virtually spelled the end of Britain's hopes for an independent nuclear deterrent, however, and Macmillan faced severe criticism on his return home. (See also GREAT BRITAIN.)

R. J. Q.

McNAMARA, Robert Strange

U.S. secretary of defense: b. San Francisco, Calif., June 9, 1916.

McNamara was educated at the University of California (B.A., 1937) and the Harvard School of Business Administration (M.B.A., 1939). After working for an accounting firm in California, he returned to Harvard in 1940 as an assistant professor of business administration. In 1943 he joined the Army Air Forces as a civilian consultant and helped to set up a statistical control system of supply. He soon was commissioned captain (later lieutenant colonel) and served in the European and Pacific theaters.

In 1946, McNamara and nine other discharged Army Air Forces statistical experts were hired as a unit by the Ford Motor Company. Beginning as a financial analyst, McNamara advanced rapidly to important company posts, including controller (1949) and group vice president of car divisions (1957). On Nov. 9, 1960, he became company president—the first person outside the Ford family to hold that position. He was sworn in as secretary of defense on Jan. 21, 1961.

McNamara, who had made several changes for greater efficiency in the defense structure in 1961, was principally concerned during 1962 with the balancing of the nuclear and conventional armaments of the United States and its allies, with such continuing international trouble spots as Berlin and Vietnam, and with the emergency created by the discovery in October of Soviet missile bases in Cuba.

At the NATO meetings in Athens (May 4–6), McNamara exhorted the European member nations to increase their contributions to NATO's conventional armament strength. As part of the Kennedy administration's opposition to separate national nuclear forces in Europe, he announced the offer to NATO of five Polaris nuclear submarines, although American command would be retained. In a statement of administration policy at the University of Michigan on June 16, he argued that "relatively weak national nuclear forces" would not be "sufficient to perform even the function of deterrence."

WIDE WORLD

Prime Minister Harold Macmillan of Great Britain relaxes after a day of hunting grouse in Yorkshire on August 13.

In December, McNamara was involved in heated discussions with the British over the experimental air-to-surface Skybolt missile, which had proved very expensive and failure-prone in development. These talks culminated on December 21 in Prime Minister Macmillan's acceptance, in his Nassau talks with President Kennedy, of submarine-launched Polaris missiles as Great Britain's nuclear deterrent in place of Skybolt. (See also MACMILLAN; MISSILES.)

As insurgent guerrilla hostilities continued in South Vietnam, McNamara visited Saigon (May 9–11) for inspection of the U.S. Military Assistance Command and talks with the Ngo Dinh Diem regime. On his return from inspection of United States forces in West Germany on September 28, he announced the government's readiness to use nuclear arms in Germany if necessary to protect such vital interests as access to West Berlin. The secretary was responsible for the military implementation of President Kennedy's quarantine of Cuba (October 23–November 21).

On December 4, McNamara announced a reorganization of the Army National Guard and Reserve. The new regulations maintained the total strength of 700,000 men but raised personnel standards, eliminated 1,861 outmoded units, and created 1,017 modern units in realigning four National Guard and four Reserve divisions into brigades. High-priority forces capable of being combat ready in eight weeks were set up by the shift of two thirds of the Reserves into six National Guard divisions and support units. (See also ARMY OF THE UNITED STATES; NATIONAL SECURITY; NORTH ATLANTIC TREATY ORGANIZATION.)

MAGAZINES

The year 1963 loomed as a most difficult one in magazine publishing, as far as profits were concerned, for there were many indications that the industry would have a hard time equaling the 1.4% net profit on sales recorded in 1962, with no hope of meeting the 1.7% profit made in 1960. This view prevailed in spite of possible all-time high records in advertising revenue and a continuing strong position in the number of advertising pages sold.

In addition to constantly rising labor and material costs, a prime factor in the gloomy profit picture was postal legislation enacted by the 87th Congress. Under the bill, rates on second-class mail—consisting mainly of newspapers and magazines—will go up by some $26 million by 1965. Earlier the House of Representatives had approved a bill which would have raised costs by about $54 million. Although the bill as finally passed was one "the industry can live with," there was great concern for some of the smaller, marginally profitable magazines.

In 1962 the women's magazines became more ladylike in their competition for advertising revenue and circulation. Considerably less time and money were devoted to claims and counterclaims as they joined the industry as a whole to fight the postal legislation. In attempts to meet stiffer competition for the advertising dollar, especially from television, the industry continued its efforts to provide advertising flexibility through regional editions, or split runs, which were becoming an accepted practice.

Meanwhile in the first half of 1962, advertising revenue rose 6% to an all-time high of $439,327,756, compared with $419,031,468 in the same 1961 period. There were strong hopes that the full year's revenue would approach $880 million, compared with the 1961 total of $836,983,480. Advertising pages sold in the first half of 1962 totaled 35,888, against 35,423 in the first half of 1961, indicating the 1962 total would be slightly higher than 1961's total of 70,497.

Business Publications.—In most important categories, 1962 was a better year for the business press than 1961. Advertising revenue, for example, was estimated at $544,500,000, compared with $518,600,000 in 1961, but still not quite as high as the $546,000,000 recorded in 1960. The number of advertising pages carried in 1962 was estimated at 1,125,000, compared with 1,108,000 in 1961 and 1,194,000 in 1960. Circulation continued a consistent upward trend, the 1962 estimate being some 53,000,000 copies, against 50,300,000 in 1961 and 47,600,000 in 1960. Despite the uncertainties of business and increasing costs, the number of publications continued upward to 2,370 in 1962, against 2,356 in 1961 and 2,310 in 1960.

Canadian Developments.—A big surprise to most observers was the fact that the Canadian Parliament did not enact legislation recommended by a Royal Commission on Publications. These recommendations would have crippled the Canadian editions of United States magazines, particularly *Time* and *Reader's Digest,* and seriously hampered the import of some other publications. United States magazines circulating in Canada continued, as did most Canadian publications, to show modest increases in both advertising and circulation.

New Publications.—Apparently reflecting the continuing profit squeeze and business uncertainties, there were only some 35 new publications scheduled to appear in the United States in 1962 or early 1963, compared with about 80 in 1961 and 54 in 1960. Among them were: *Baseball Monthly; Bay Play; Collector's Quarterly Report; Columbia Journalism Review* (a quarterly); *Eros; Fair Sex; FM Listeners Guide; Leisure* (circulated exclusively to barbers); *Master Drawings,* an art quarterly devoted to the 14th–19th centuries; *One-Design Yachtsman; Shopping Center Age; This Month,* which discontinued after six months; *University Woman;* and *Upper Class.*

New appearances scheduled in the business field included: *Area Digest; Auto Body News and Good Car Care; Best Western; The Candy Marketer; Chemical Equipment News; C/M,* for concrete block producers; *Discount Store News; Engineering Digest,* for engineering students; *Evaluation Engineering; Folio,* a graphic arts communication publication; *International Commerce,* succeeding *Foreign Commerce Weekly; Lawn/Garden/Outdoor Living; Metal-Center News; National Surveyor; New Plant Planning; Rental Housing; School Product News; Server Quarterly* (in alcoholic products marketing); and *Textiles, Notions and Trimmings.*

Sales and Mergers.—*American Mercury,* founded by the late H. L. Mencken and George Jean Nathan, was sold by the Defenders of the Christian Faith to a Texas group called the Legion for the Survival of Freedom; Cowles Magazines & Broadcasting bought *Family Circle* for an estimated $3,500,000 in stock; and in August, *Show* bought and discontinued *USA*1,* which had been started in April.

Disappearing from the scene were *American Salesman; Boating Year Round/Outboard;* and *Musical Courier,* America's oldest musical magazine, which had been founded in 1880.

MAINE

A New England state of the United States, Maine ranks 39th among the states in area (land, 31,012 square miles; inland water, 2,203) and 37th in population (999,000 on July 1, 1962, a 3.0% increase from the 1960 census figure of 969,265). Urban places, including towns (T) and unincorporated places (U) with populations above 10,000 in 1960:

Auburn	24,449	Portland	72,566
Augusta (*capital*)	21,680	Presque Isle	12,886
Bangor	38,912	Rumford T.	10,005
Bath	10,717	Saco	10,515
Biddeford	19,255	Sanford T.	14,962
Brunswick T.	15,797	Sanford (U)	10,936
Caribou T.	12,464	South Portland	22,788
Kittery T.	10,689	Waterville	18,695
Lewiston	40,804	Westbrook	13,820
Limestone T.	13,102		

Government.—Chief executive and judicial officers in 1962 included John H. Reed (Republican), governor, serving a four-year term; Paul A. MacDonald, secretary of state; Frank S. Carpenter, treasurer; Michael A. Napolitano, auditor; Frank E. Hancock, attorney general; Warren G. Hill, commissioner of education; and Robert B. Williamson, chief justice of the 6-member Supreme Judicial Court.

The Maine Legislature, which convenes in odd-numbered years, comprised 30 Republicans and 3 Democrats in the Senate in 1962 and 111 Republicans and 40 Democrats in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $147,179,888 included $89,223,494 from state taxes and $37,823,763 in federal funds. Chief tax yields were the 3% general sales tax ($29,529,156), a motor fuel tax ($24,366,629), and licensing ($11,784,875). Spending of $147,607,926 included $26,099,410 for education, $43,605,773 for health, welfare, and safety, and $50,677,213 for highways.

Education.—In the 1960–61 school year, public elementary schools staffed by 5,763 teachers enrolled 156,914 pupils; secondary schools with 2,697 teachers enrolled 44,534; and private and parochial schools with 1,279 teachers enrolled 33,701. College enrollment (fall 1961) totaled 13,687.

Estimated public school spending in the 1961–62 school year totaled $71.36 million, including current expenditures of $61.7 million ($330 per pupil) and capital outlays of $8 million. Revenue of $79 million was drawn chiefly from state funds ($15 million) and local districts ($50 million). The state reported teachers' salaries as averaging $4,619 (high school, $5,027; elementary, $4,378). Actual spending for higher education comprised $5,885,479 for operations and $2,768,750 for construction and improvements.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 44,659 persons totaled $21,158,420. This amount included $9,279,011 for the aged and $7,172,651 for dependent children.

Transportation and Communications.—With 259 miles of highway construction and reconstruction completed in 1961, *roads and highways* on March 1, 1962, totaled 20,888 miles (17,500 surfaced). These served 384,064 *motor vehicles* (as registered on Dec. 31, 1961), including 309,439 automobiles. Operating in the state in 1961 were 7 *railroads* (using 1,874 line miles of track); (1962) 1 regularly scheduled *airline;* 30 commercial and municipal *airports;* and 66 commercial and private seaplane bases.

Communications media included (1961) 24 AM and 2 FM *radio stations;* 7 VHF *television stations;* 9 daily *newspapers* (circulation, 251,346) and 53 other newspapers (283,187); and (Jan. 1, 1962) 86,700 business and 248,200 residential *telephones.*

Labor Force.—The state's labor force on Aug. 15, 1962, included 26,900 agricultural workers. Nonagricultural employment totaled 332,300, compared with 336,100 a year earlier and an average of 319,800 for the 12 intervening months. Of nonfarm employees, 33% were in manufacturing, 16.5% in trade, and 14.6% in government services. Unemployment on Aug. 15, 1962, was down to 16,600 from the 21,200 reported a year earlier.

Manufacturing.—The state Census of Manufactures reported a total of 106,215 manufacturing workers in the state in 1961 who received $440,681,988 in wages. Value of product amounted to $1,491,732,923.

LEADING MAINE MANUFACTURES, 1961

Industry group	Employees	Gross wages	Value of product
Paper and allied products	17,446	$96,182,669	$434,394,041
Food and kindred products	11,938	39,897,316	274,250,354
Leather and leather products	23,615	75,679,611	236,489,347
Textile mill products	12,330	43,107,667	160,446,199
Lumber and wood products (except furniture)	11,375	38,735,124	118,655,337
Transportation equipment[1]	15,316	92,545,928	82,772,077
Fabricated metals	1,636	7,396,649	28,785,802
Printing and publishing	2,198	9,459,165	25,580,845

[1] Includes data for Kittery Naval Shipyard, except for "value of product." (Source: Maine Department of Labor and Industry.)

Mining.—In 1961, Maine ranked 46th among the states in value of mineral output, with 0.08% of the national total. The record value represented a 9% increase over 1960. More than half of the total value of $14,969,000 was represented by stone ($4,694,000) and sand and gravel ($3,796,000).

Fisheries.—The commercial fish and shellfish catch in 1961 totaled 197,969,532 pounds valued at $19,029,469. Leading species were lobster (20,917,920 pounds valued at $11,119,803) and ocean perch (77,350,099; $2,942,313).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $140,768,000, compared with $141,773,000 for the corresponding period of 1961. For the full year 1961, income comprised $116,978,000 from livestock, $63,191,000 from crops, and $2,622,000 in government payments. Principal income sources in 1961 were potatoes, $38,063,000; broilers, $36,263,000; wholesale milk, $32,534,000; and eggs, $32,298,000.

The state's 17,000 farms in 1959 had an acreage of 3,082,000 (698,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 200,000 cattle and 4,627,000 chickens, and (1961) 58,480,000 commercial broilers.

MAINE CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	1,220	2,000	1,750
Hay (1,000 tons)	666	578	537
Oats (1,000 bu.)	3,054	2,115	2,303
Potatoes (1,000 cwt.)	34,195	37,000	38,955

(Source: U.S. Department of Agriculture.)

Events, 1962.—The Republican Party claimed a sweeping victory in Maine after the election of November 6, but Democrat Maynard C. Dolloff of Augusta, candidate for the governorship against incumbent John H. Reed, demanded a recount. The apparent margin of Governor Reed was 621 votes (146,742 to 146,121). The result of the November–December recount was to confirm the reelection of Governor Reed by the scant margin of 519 votes.

Although recounts were demanded also in a number of state legislative districts, it was clear that the Republican hold on both houses was firmly retained. The official tabulation, completed on November 22, showed that there were 110 Republicans and 41 Democrats in the House, and 29 Republicans and 5 Democrats in the Senate (a gain for the Democrats of 1 seat in each house plus a new seat in the Senate). In the reconstituted 1st Congressional District, Republican Stanley R. Tupper, former 2d District congressman, was reelected by a wide margin, while veteran legislator Clifford G. McIntire was returned to the House from the new 2d District by 3,190 votes.

Voters were asked to decide three referendum questions during the year. In June they approved a bond issue to provide educational television for eastern Maine, and in November they accepted two amendments to the state constitution—one designed to prevent diversion of state retirement funds, the other allowing local voters to pledge community credit for construction of industrial buildings.

The first of a series of reports on a study of the Passamaquoddy Bay tidal project and related power developments on the St. John River was issued on March 5 by the Department of the Interior. In July, Secretary of the Interior Stewart L. Udall visited eastern Maine to study the multi-use development possibilities of the area. The Allagash region through which the St. John flows is renowned as a sportsmen's and canoeist's paradise. Privately owned, it supplies large amounts of timber, much of which would be flooded by hydroelectric development. No decisions have yet been reached as to reconciling the diverse interests in the Allagash, including industrial and power development, timberland use, and possible creation of a national park.

In the western hills of Maine is the small town of Andover, chosen as the site for the Andover Earth Station because of its freedom from radio waves. On July 10, the communications satellite Telstar was fired into orbit from Cape Canaveral, Fla., and the Andover station became operative as the United States counterpart of similar tracking and relay stations in England and France. On the day of launching, history was made when the first telephone messages were sent from Andover and received in Washington, D.C. Later the same day television pictures were transmitted to Europe, and

A year-end snowstorm crippled much of New England. Here, Bangor, Me., digs out from a 37-inch snowfall, December 31.

on July 11 a television broadcast was received from Europe. (See also RADIO AND TELEVISION; SPACE FLIGHT.)

Head, Department of History and Government, University of Maine.

MALAGASY (MALGACHE) REPUBLIC

The Malagasy Republic consists chiefly of the island of Madagascar, lying in the Indian Ocean, 240 miles off the southeast coast of Africa. It is 980 miles long and 360 miles at its widest point, and has an area of 228,000 square miles. The population is 5,650,000 (1961 est.), consisting of 5.5 million Malagasy and 150,000 French. The principal cities and their populations (1961 est.) are the capital, Tananarive (240,000) and the provincial capitals of Majunga (55,000), Tamatave (50,000), Fianarantsoa (35,000), Diégo-Suarez (39,000), and Tuléar (30,000). The principal languages are Malagasy (Malgache) and French.

Government.—The former French overseas territory of Madagascar became autonomous on Oct. 14, 1958, an independent member of the French Community (q.v.) on June 26, 1960, and a member of the United Nations on Sept. 20, 1960. The constitution of April 28, 1959 (amended in June 1960) provides for a bicameral legislature. The Senate consists of 54 members (18 appointed, 36 elected), serving six-year terms; the National Assembly has 107 members, all elected by universal suffrage to five-year terms. Philibert Tsiranana was elected in 1959 by the electoral college to serve a seven-year term as president; he is the leader of the Social Democratic Party, which holds most Senate and Assembly seats.

Education and Religion.—In 1961 there were 458,447 primary school pupils (in 2,394 schools); 6,000 secondary school pupils; and 2,460 technical school pupils. A university was opened on Dec. 4, 1961. There are 5,200 Roman Catholic, 5,755 Protestant, and 75 Muslim houses of worship; most of the rural population is animist.

Finance.—General budget, 1961: 18,935 million francs CFA (16,488 million in 1960; 246.85 francs CFA equal U.S.$1); grants from France, 2,044 million francs CFA (7,680 million); public debt, 860 million francs CFA.

Transportation and Communications.—Transport networks (miles, 1961): railways, 532; all-weather roads, 5,000; navigable waterways, 1,550. The two main ports handled 615 ships and 179,653 metric tons of cargo in 1960; the four main airfields and the international airport at Tananarive are served by five foreign airlines, which carried 18,784 passengers in 1960. Other data for 1960: passenger cars, 21,800; commercial vehicles, 20,000; telephones, 13,757; radio receivers, 55,000 (1959).

Economic Indicators.—National income: about $500 million per year, or $80–90 per person, in 1961. The economic trend, which has been downward since 1960, rose slightly in early 1962.

Manufactures and Minerals.—Chief industrial products (metric tons, 1960): mica, 1,010; graphite, 14,400; phosphate, 4,630; ilmenite, 2,729; zircon, 340; beryl, 636; cement, 18,450; gold, 8.5 kilograms; electric power, 72.5 million kw.-hr. Other industries include silk and cotton weaving, the making of panama and straw hats, and meat canning; almost all other manufactured goods are imported.

Agriculture.—Supporting 90% of the population, agriculture is carried on mostly at the subsistence level. Rice is the principal food crop, and coffee is the chief export crop, accounting for about one third of the nation's export earnings. Chief crops (thousand metric tons, 1961): rice, 1,300 (estimate); manioc, 900; maize, 79. Export crops: coffee, 50; sugarcane, 85; peanuts, 25; vanilla, 0.4; batata, 139; coconuts, 2,460; bananas, 71.6.

Foreign Trade.—Total exports, 1961: 247.2 million metric tons (19,137.7 million francs CFA); imports, 383.9 million metric tons (25,532.3 million francs CFA). Principal exports (in million francs CFA, 1961): coffee, 5,547; cloves, 303.3; tobacco, 673; rice, 1,187; vanilla, 1,885; sugar, 1,036. Principal imports (in million francs CFA, 1960): metalware, 2,906; vehicles, 3,123; chemicals, 2,548; machinery, 1,887; textiles, 2,939; apparel, 881.3; cement and liquid fuel, 2,209.2; electrical appliances, 1,324; foodstuffs, 4,233. Principal suppliers (with percentage of total imports provided, 1960): France, 70.2%; Iran, 3.3%; United States, 2.9%; West Germany, 2.5%; United Kingdom, 1.7%. Chief customers (with percentage of total Malagasy exports received, 1960): France, 55%; zones: franc, 73%; dollar, 13%; sterling, 4.5%.

Events, 1962.—President Tsiranana attended the important Lagos (Nigeria) Conference, January 25–31, during which 20 African nations formed an affiliation comparable to that of the Organization of American States. (See also AFRICA.) A one-week economic development conference in April brought together over 700 Malagasy leaders and foreign specialists. Plans were laid for an international fair to be held in Tamatave in September 1963 to help attract investment capital. The United Nations Educational, Scientific and Cultural Organization held its first conference on higher education in Africa at Tananarive in September.

FRANKLIN PARKER,
Associate Professor, Department of the History and Philosophy of Education, University of Texas.

MALAYA

This independent federated territory in Southeast Asia occupies 50,680 square miles of the Malay Peninsula south of Thailand; it is separated from Singapore (q.v.) by the Straits of Johore. Comprising nine Malay states and the former British settlements of Penang and Malacca, Malaya became fully self-governing on Aug. 31, 1957, as the 11th sovereign member of the Commonwealth of Nations. The federal capital is Kuala Lumpur (pop., 316,230, 1957 census).

The population (7,136,804 on June 30, 1961) is increasing by 3.3% annually (one of the highest rates of growth in the world); it comprised (mid-1961) 3,576,889 Malaysians, 2,633,516 Chinese, 796,880 Indians and Pakistanis, and 129,519 others. The component states, with their areas, populations, and capital cities, are as follows:

FEDERATION OF MALAYA

State	Area (sq. mi.)	Pop. (1961 est.)	Capital
Johore	7,330	1,064,814	Johore Bahru
Kedah[1]	3,660	783,993	Alor Star
Kelantan	5,750	570,998	Kota Bahru
Malacca	640	335,127	Malacca
Negri Sembilan	2,580	422,694	Seremban
Pahang[2]	13,820	354,316	Kuantan
Penang[3]	400	642,221	George Town
Perak	7,980	1,384,321	Ipoh
Perlis	310	101,357	Kangar
Selangor	3,160	1,159,914	Kuala Lumpur
Trengganu	5,050	317,049	Kuala Trengganu
Total	50,680	7,136,804	

[1] Includes Langkawi and adjoining islands. [2] Includes Tioman Island in South China Sea. [3] Penang State comprises Penang Island (110 square miles) and Province Wellesley (290 square miles).

Government.—A head of state or paramount ruler (called the Yang di-Pertuan Agong) is elected by the rulers of the nine states from among their number; he serves a 5-year term. The Raja of Perlis, Sir Putra Ibni al-Marhum Syed Hassan Jamalullail, formerly the deputy head of state, was elected on Sept. 21, 1960, and installed on Jan. 4, 1961, as the third paramount ruler since i dependence.

The federal Parliament, modeled on that of the United Kingdom, comprises a Senate (Dewan Negara) of 22 elected members (2 from each state) and 16 appointed members, and a House of Representatives (Dewan Ra'ayat) of 104 elected members. The paramount ruler is advised by a cabinet headed by a prime minister; Tunku (Prince) Abdul Rahman has served in this post since independence except for a brief period in 1959. The individual states have executive councils, state legislative assemblies, and numerous local authorities, including 297 local councils in 1962.

Education and Religion.—Schools, 1962: 5,538; pupils, 1,391,848; teachers, 49,887 (primary schools, 4,871; pupils, 1,170,374; teachers, 41,965); university students, 1962: 2,062, including 695 federation students attending the University of Singapore. In 1962 the Kuala Lumpur Division of the University of Malaya became a separate and autonomous national university. About 50% of the people are Muslims.

Defense.—Principal components of Malayan defens are the Royal Malay Regiment (7 battalions in 1962); the Federation Reconnaissance Corps (2 regiments); a field regiment of artillery; 6 field squadrons of engineers and signal men; and a maintenance corps. The Royal Malayan Air Force was formed in 1958, largely with personnel from the British Royal Air Force. The Royal Malayan Navy, based at Singapore, is used mainly for coastal defense.

Finance and Development, 1961.—Current account expenditures (est., in millions): M$899 (administration,

M$186; education, M$189; defense, M$179; social welfare, M$91); revenue: M$1,070 (export duties, M$192; import duties, M$356); capital expenditures, est., M$288. (The Malayan dollar equals 32.667 U.S. cents.)

The federation's second five-year plan, introduced on Feb. 3, 1961, calls for an overall investment of M$5,050 million, with proposed expenditure of M$2,150 million in the public sector. About half this sum is allocated to rural development, and M$451 million to social services.

Transportation and Communications.—Federal highways, 1961: 2,507 miles; state roads, 4,489 miles; registered motor vehicles, 219,410 (private cars, 103,149; omnibuses, 2,908; trucks and vans, 31,083). The government-owned railway (route mileage, 1,028, including 488 miles of main line) connects principal centers with Singapore; branch lines serve the chief ports. Internal services of Malayan Airways (MAL) carried 78,762 passengers in 1961, using 9 airports and 36 additional landing fields. A number of foreign airlines maintain service to Kuala Lumpur. Telephone stations, 1961: 80,597; radio licensees, 1960: 226,828.

Economic Indicators.—Per capita income (1957, est.): M$825 (one of the highest in Asia); gross national product (at market prices, 1957): M$5,180 million; Malaysian laborers' cost-of-living index, 1959 (1949 = 100): 123 (in 1958: 127); bank note circulation, 1961: M$1,131 million; post office savings bank deposits, 1961: M$153 million, due to 756,494 depositors; public debt, 1960: M$1,106.9 million; foreign assets (net, 1959): M$1,749 million.

Manufactures and Mining.—Industrial output (1960) included rubber shoes and slippers (1,329,028 dozen pairs); cement (281,864 tons); bricks (75,368,000); and floor tiles (209,265). Malaya is the world's leading tin producer; 56,028 tons of tin concentrates were exported in 1961. Other mineral production, 1961: iron ore, 6,733,520 tons; bauxite, 409,881 tons; ilmenite, 106,975 tons; and gold, 12,486 troy ounces. Electric power production, 1961: 1,344.4 million kw.-hr.

Agriculture.—Rubber (734,619 long tons produced in 1961) is Malaya's most important crop, accounting for 60% of the value of total exports; some 300,000 workers are employed on rubber estates totaling 2.3 million acres; another 2 million acres are worked by smallholders. Other agricultural yields (1961) included (in thousands of long tons); rice, 605.0; copra, 162.3; palm oil, 93.3; and tea (from 8,700 acres), 5,808,615 pounds.

Foreign Trade.—Total exports, 1961 (in millions): M$2,626 including rubber (790,562 tons), M$1,442; tin, M$553 (up M$46 over 1960); and iron ore (6.4 million tons), M$164 (up M$24). Imports: M$2,150.6, including foodstuffs, M$561.8; manufactured goods, M$408.5; machinery, M$388.9; and mineral fuels, M$142.7. The favorable trade balance of M$475.4 million was less than in either 1960 or 1959.

Events, 1962.—Following the work of a commission of inquiry headed by Lord Cobbold, an agreement was signed on July 31 in London by British Prime Minister Macmillan and Tunku Abdul Rahman, prime minister of Malaya, for the establishment by Aug. 31, 1963, of the Federation of Malaysia. Bringing together in a single organization varied racial groups with an aggregate population (1961) of 10,083,726 and a combined area of 130,017.5 square miles, Malaysia will consist of Malaya, Singapore, the British colonies of Sarawak and North Borneo, and the protected sultanate of Brunei (the last three on the island of Borneo). Provision was made for the continuance of British defense facilities at Singapore.

On January 30 the London proposals were approved by the Singapore Legislative Assembly, 19 of whose members, however, subsequently petitioned the United Nations to prevent the merger. A claim to North Borneo by the Philippines government, and a proposal by President Macapagal to enlarge Malaysia to include his country, were both rejected. (See also PHILIPPINES.)

In a referendum held in Singapore on September 1, 90 per cent of the electorate (totaling 624,000) chose among three alternatives a form of Malaysian membership restricting parliamentary representation to 15 seats (one eighth of the whole) while retaining autonomy for Singapore in respect to education and labor.

State visits were paid in 1962 by the paramount ruler of Malaya to India and Pakistan.

LONDON DAILY EXPRESS

Malayan Prime Minister Tunku Abdul Rahman (right), shown with Ambassador Tunku Halim Shah, arrives in London on July 17 for talks on the proposed Federation of Malaysia.

MALDIVE ISLANDS

A chain of 19 groups of coral islands in the Indian Ocean extending some 400 miles southwest of Ceylon, the Maldive Islands have a total area of 115 square miles, and a population (1960 est.) of 92,301, mainly Sunni Muslims. Male (pop., 12,000), on Male atoll, is the capital. The Maldive archipelago is a self-governing sultanate (Sultan Mohamed Farid Didi), under the protection of Great Britain. Fishing and the cultivation of coconut palms, millet, fruit, and edible nuts are the chief occupations. The main export is dried bonito, which accounts for 95% of the islands' exports. Gan Island in Addu atoll has been leased to Great Britain for 30 years (effective from December 1956), and is used as a naval anchorage and airbase. In 1960 an airstrip was built at Hulele, about 300 miles north of Gan.

MALGACHE REPUBLIC. See MALAGASY.

MALI

The Republic of Mali (formerly the Soudanese Republic) is situated in inland northwestern Africa, and has an estimated area of 464,873 square miles, mostly desert. The population of 4,100,000 (est. 1961) comprises Hamitic and Negro peoples, as well as about 7,000 nonindigenous persons, mainly French. The official language is French. The capital and principal city is Bamako (1961 est. pop., 120,000).

Government.—This former territory (French Sudan or Soudan) within French West Africa attained independence as a component (with Senegal) of the Mali Federation on June 20, 1960. The Soudanese Republic changed its name to the Republic of Mali on Sept. 22, 1960, after Senegal withdrew from the federation. Mali joined Ghana and Guinea in a loose political association called the Union of African States, effective as of July 1, 1961. The republic has a National Assembly of 80 members elected for a five-year term by universal suffrage. Modibo Keita, leader of the ruling Soudanese Union, has been president of the republic since September 1960; he is also minister of foreign affairs and of defense and security.

Education and Religion.—Mali had 298 schools with an aggregate enrollment of 44,801 pupils (8.2% of the school-age population) in 1958. Muslims comprise about 63% of the population; animists, 36%; and Christians, less than 1%.

Finance.—Ordinary budget expenditure, 1961 est.: 11.7 billion francs CFA; capital equipment expenditure: 11.1 billion. The CFA franc was replaced as legal tender by the new Mali franc as of July 1, 1962; the Mali franc, issued by the new Bank of the Republic of Mali, is equivalent in value to the CFA franc, and 246.85 new francs equal the U.S. dollar. French assistance to Mali in 1961 amounted to 1.5 billion francs CFA in loans, and another 1.5 billion in economic grants.

Transportation.—Mali's main link with the Atlantic coast is the railway from Koulikoro to the Senegal border, via Bamako and Kayes, but the line has not been used since September 1960 because of the disruption in rela-

tions between Mali and Senegal. Since then the principal traffic outlet has been by road to Ivory Coast and thence by rail to the port of Abidjan, Ivory Coast, although the proposed extension of the Guinea railway to Bamako would give Mali an alternate route to the sea. Main roads (miles, 1961), 6,800; secondary roads, 4,700. The national airline, Air Mali, which began operations in 1961, provides both internal service and flights to Paris and to points in West Africa.

Production.—Basically an agricultural country, Mali is self-sufficient in food staples, livestock, and fish. Chief crops (metric tons, 1961 est.): millet and sorghum, 785,000; cassava, 200,000; rice, 190,000; unshelled peanuts, 83,000; corn, 62,000; sweet potatoes, 60,000; seed cotton, 11,000. Manufacturing is confined to the processing of agricultural products, principally peanut oil, polished rice, cotton goods, and beverages. Traditional handicrafts include leather goods, carpets, and rugs.

Foreign Trade.—Declared exports, 1961 est.: 9.3 billion francs CFA; imports, 11.8 billion. Chief exports: shelled peanuts (48,709 metric tons exported in 1961), cattle, fish, rice, cotton, and gum arabic. Mali's chief trading partners are France and neighboring nations within the franc zone.

Events, 1962.—President Keita's leftist government, which in the past has pursued militantly neutralist policies, took steps to normalize relations with France. Early in the year the two nations signed five agreements for cooperation in technical and cultural affairs, and for reciprocal preferential treatment in economic, monetary, and financial matters. The agreements, similar to those concluded between France and other former French African territories, were reached after lengthy negotiations. France agreed to contribute financial aid to Mali's four-year economic and social development plan (1961–65), which aims to increase the national product by 8% annually and is to cost an estimated 64 billion francs CFA.

The normalization of Mali-French relations, however, did not deter the Keita government from following a radically leftist course both at home and abroad. President Keita in late May paid an official ten-day visit to the Soviet Union, where he praised the accomplishments of the Soviet people and declared that Mali had "most firmly embarked on the road to socialism." After conferring in Moscow with Premier Khrushchev and other Soviet leaders, he signed a joint communiqué (published May 31) which declared that the views of the Mali and Soviet governments were "identical" on important world problems. The communiqué also promised Mali further Soviet economic and technical aid.

Following his departure from Moscow on May 31, Keita visited Czechoslovakia and West Germany. Mali's relations with West Germany have been very close despite the former's cooperation with the Communist bloc. West Germany, which has supplied trucks to transport Mali's important peanut crop, agreed in February 1962 to construct two peanut-processing mills in Mali at a cost equivalent to $3.25 million.

Demonstrations led by Malian merchants to protest the introduction of the Mali franc and new currency regulations occurred in Bamako on July 20. Ninety-one persons arrested at that time were tried in late September on charges that they had attempted to overthrow the government. Two leaders of the demonstrations were sentenced to death on October 1, but their sentences were later commuted to life imprisonment.

W. R. F.

MALTA

Lying in the Mediterranean Sea about halfway between Gibraltar and Suez, the State of Malta has a total area of 122 square miles, and a population (1961 est.) of 329,000. The state comprises the islands of Malta (95 square miles), Gozo, and Comino. Valetta (pop., 18,287) is the capital and chief port. Maltese and English are the official languages.

Under the constitution promulgated on Oct. 24, 1961, Malta became a self-governing state on March 3, 1962. Concurrent authority over defense and foreign affairs is exercised by Great Britain, acting through its high commissioner (Edward Wakefield, appointed March 6, 1962). The head of state is a British-appointed governor (Sir Maurice Dorman, appointed to succeed Admiral Sir Guy Grantham on April 7, 1962). Executive power is vested in a cabinet, headed by a prime minister (Georgio Borg Olivier), and is responsible to a 50-member Legislative Assembly elected by universal suffrage.

Government revenue for 1962–63 was estimated at £13,198,107; expenditure, £13,018,718. The capital budget was set at £6,881,010. School enrollment, 1961: primary, 61,700; secondary, 9,350; teacher-training, 234; vocational, 1,040; and higher, 320 (1960). Television broadcasting was inaugurated in September 1962.

Malta's economy is dependent to a large measure on British military installations and commercial drydocks. In 1961, exports were valued at £4.64 million; imports, £29.3 million. The principal exports were scrap metal, vegetables and vegetable oil, hides and skins, and flowers and seeds.

After a bitter electoral campaign in which strong pressure was brought against the Labour Party by the Roman Catholic hierarchy, the Nationalist Party, led by Georgio Borg Olivier, emerged in 1962 as Malta's leading party. In the elections of February 17–19, the Nationalist Party won 25 seats; Labour Party, 16; Democratic Nationalist Party, 4; Christian Worker's Party, 4; and the Progressive Constitutional Party, 1.

Following the proclamation of the State of Malta on March 3, 1962, Prime Minister Olivier requested that Britain relinquish control over the police and civil service. The request was granted on April 16, but further negotiations for the amelioration of Malta's economic difficulties resulted in stalemate. On August 20, Olivier announced that the Maltese government would seek complete independence for Malta within the Commonwealth of Nations.

MANCHURIA. A region of northeastern China. See China, People's Republic of.

MANGANESE

World production of manganese ore was estimated at 14,933,000 short tons in 1961, compared with 15,006,000 short tons in 1960. The accompanying table shows data on the United States manganese industry, based on compilations of the U.S. Bureau of Mines.

MANGANESE IN THE UNITED STATES
(Thousands of short tons)

	1958	1959	1960	1961
Mine shipments	327.3	229.2	80.0	46.0
Metallurgical ore	327.3	223.2	70.9	39.2
Battery ore	...[1]	6.0	9.1	6.8
Imports, general	2,452.6	2,397.8	2,543.8[3]	2,098.4
For consumption	1,798.6	1,878.1	2,277.0[3]	2,147.2
Available supply[2]	2,125.9	2,107.3	2,357.0[3]	2,193.2
Consumption	1,497.6	1,605.5	1,946.4	1,717.8
Ferromanganese-made	636.7	629.3	842.8	732.8

[1] Battery and metallurgical ore lumped. [2] Mine shipments plus imports for consumption. [3] Revised.

United States domestic production (shipments) in 1961 totaled 46,088 short tons (ore, concentrate, and nodules containing 35% or more of manganese), more than 42% less than in 1960 and less than 1% of the world output of manganese. The 1961 decrease reflected the expiration in July 1961 of the last government contract for purchase of domestic manganese ore. Consumption of manganese ore in the United States decreased 12% from 1960; domestic sources supplied only 1% of the total. The average grade of imported manganese ore was 47% manganese, compared with 47.7% for 1959 and 1960. Brazil supplied 35% of the total ore received in 1961; Republic of South Af-

rica, 12%; Ghana, 11%; Mexico, 9%; India and Republic of the Congo, 8% each; British Guiana and Morocco, 6% each.

In the first eight months of 1962, general imports of manganese ore totaled 1,515,185 short tons, and of ferromanganese (in terms of ore), 170,510 short tons; exports were 5,912 short tons of ore and 11,374 short tons of ferromanganese (in terms of ore).

(See also MINERAL PRODUCTION.)

MANITOBA

Manitoba, the central province of Canada, is bounded on the east by Ontario, on the west by Saskatchewan, on the south by the states of North Dakota and Minnesota, and on the north by the Northwest Territories and the 440-mile shoreline of Hudson Bay. Its area is 251,000 square miles, including 39,255 square miles of water. The population (1961 census) is 921,686, about 60% of which is urban. (The estimated population on June 1, 1962, was 935,000.) The capital of the province is Winnipeg, with a population of 265,429 (Greater Winnipeg, 474,374). Other cities and their 1961 populations include St. Boniface, 37,600; St. James, 33,977; Brandon, 28,166; East Kildonan, 27,305; St. Vital, 27,000; West Kildonan, 20,077; Transcona, 14,248; Portage la Prairie, 12,388; and Flin Flon, 11,104.

Government.—The British crown is represented by a lieutenant-governor, Errick F. Willis, who took office on Jan. 20, 1960. The provincial government was headed in 1962 by Premier Dufferin Roblin. Parties represented in the provincial Legislative Assembly (following the elections of Dec. 14, 1962) are Roblin's Progressive Conservative, 35 seats; Liberal, 13; New Democratic (the former Co-operative Commonwealth Federation), 8; and Social Credit, 1. Manitoba has 14 members in the federal House of Commons and 6 representatives in the Senate in Ottawa.

Finance.—As of March 31, 1961, surplus over expenditure was $9,388,112.30, from revenue of $103,038,602.24.

Education.—In the 1960–1961 school year there were in the province 1,361 school districts with operating classrooms having 192,747 pupils and 7,622 teachers. Construction of the Manitoba Institute of Technology, to accommodate 2,000 students, was expected to be completed in the spring of 1963. Six colleges are affiliated with the University of Manitoba. There is a teacher-training college, a technical vocational school, a medical college, and a dental college.

Public Health and Welfare.—Under the Manitoba Health Services Act, 14 local health units in 1961 served a total population of 442,216. Laboratory and X-ray units operate with headquarters at Selkirk, Virden, Dauphin, Neepawa, and Portage la Prairie. There are hospitals for mental diseases at Brandon, Selkirk, and Portage la Prairie, and a psychopathic hospital in Winnipeg. The compulsory provincial health insurance covers standard (public) ward care and includes X-rays, operating and laboratory facilities, and nursing services.

A hospital commission was established in 1962 to operate the hospital services plan. The Department of Health outlined a $58,596,000, eight-year hospital construction program with emphasis on chronic care institutions and diversified mental treatment centers.

Transportation and Communications.—The government-owned telephone system had 285,327 subscribers as of March 31, 1962. The province's railroads, exclusive of yard tracks and sidings, comprise 5,005 miles of tracks. Canadian National Railways' new $23 million Symington freight classification yard opened in September 1962 in St. Boniface. It automatically services, sorts, and sends up to 6,000 freight cars a day. Roads include 5,425 miles of all-weather roads (2,927 graveled, 2,289 bituminous, and 209 concrete), 3,848 miles of provincial trunk highways, 252 miles of secondary roads, and 1,990 miles of other roads, not including municipal roads.

Production.—Shipments of grain through the port of Churchill in 1961 totaled 19,400,000 bushels. The value of the province's dairy products amounted to $33,936,000; garden products, $9,090,000; poultry products, $23,093,000; fur farming, $3,000,000; honey, $881,000; field crops, which include only initial payments for wheat, oats, and barley, $108,724,000; and livestock, $82,855,000.

The fish catch amounted to 30,661,550 pounds, with a value to fishermen of $3,173,981 and a marketed value of $5,663,025.

The estimated value of mineral production in 1961 was $99,156,908, $71,928,597 of which was in metals. This total includes about 4,485,000 barrels of crude oil, valued at $10,200,000, and clay products, structural materials, peat moss, and salt.

The estimated value of raw furs exported in 1961 was $7,660,549, and the estimated value of processed furs, $4,357,636.

Events, 1962.—In the provincial elections of December 14, Premier Dufferin Roblin's ruling Progressive Conservative government won 35 seats and increased its majority in the Legislative Assembly by one seat. The Liberal Party gained three seats by electing 13 legislators. The New Democratic Party won 8 seats, a loss of one.

In Manitoba, the 150th anniversary of the arrival of the first agricultural settlers (Selkirk Settlement) was celebrated in 1962. Northern Manitoba centers in August celebrated the 50th anniversary of the extension of the provincial boundaries north to the 60th parallel.

Provincial royal commissions were appointed to study provincial-municipal relations and to review the operations of the metropolitan government of Greater Winnipeg. The Manitoba Labor Relations Act was amended to make labor unions legal entities and to include provision for government-supervised strike votes.

Construction of the 30-mile, $63 million floodway channel of the Greater Winnipeg Floodway began in October. A highway bridge across the Saskatchewan River at Grand Rapids, site of a $140 million hydroelectric power development under construction, was completed in September.

MARINE BIOLOGY

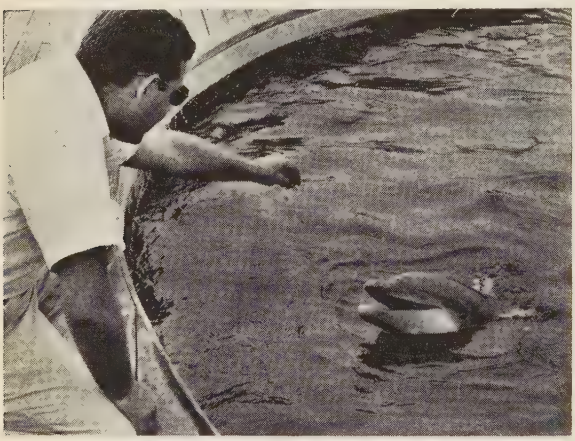
Among the subjects covered by research and publications in marine biology in 1962 were lobsters, dolphins, sharks, and Antarctic biology.

Lobster Development.—Valuable information on the biology and life history of the American lobster, *Homarus americanus*, which ranges along the 1,300 miles of coastline from Delaware to Labrador, was published in 1962, a result of ten years of hatching and rearing lobsters at the Massachusetts State Hatchery on Martha's Vineyard. Over 1.5 million lobsters have been reared to the fourth larval stage—at which they leave the hazards of planktonic life and settle to the bottom—and released along the coast.

From mating until the eggs hatch requires two years. The young molt about ten times during their first year; from two to five times, with decreasing frequency, during the next four years; and once a year thereafter. Hatching of eggs begins in May, when the water temperature rises to about 15°C., and is at its peak during June and July, when the water temperature is about 20°C. Development to the fourth larval stage takes 10 to 30 days, depending on the temperature (it is faster if the temperature is above 18°C.). A lobster must be about five years old before it reaches minimum legal marketable size (in Massachusetts). On the basis of observations at the hatchery, a one-pound lobster has consumed about 15 pounds of food. The lobster catch along the New England coast has been stable for ten years, indicating that the fishery is not depleting the present inshore population.

Dolphins.—The controversy concerning the technique used by dolphins to ride the bow waves of ships has been settled by motion pictures taken through underwater viewing ports installed in the bow of the U.S. Fish and Wildlife vessel *Charles H. Gilbert*. It seems clear in the film that dolphins use the entire body to take advantage of the forward component of bow wave forces, rather than being pushed by their flukes, as had been postulated. In a preliminary report of research in progress on these fascinating animals, Dr. J. C. Lilly expressed the opinion that the cacophony of sounds dolphins make may represent signals to each other. He also said that they can be taught to utter human words and to understand meanings. Dr. W. N. Kellogg of Florida State University discovered in the 1950's their ability to use echo location for catching food and avoiding objects in the dark. He wrote that some of the sounds were used to convey messages to each other. Kellogg summarized his research early in 1962.

Shark Problem.—There were 31 known shark attacks (six in the United States) during 1961, six of which were fatal, according to the Shark Research Panel of the American Institute of Biological Sciences. The sharks involved ranged from a two-foot banjo to a 2,500-pound white pointer and represented 17 different species. Of the six that occurred in the United States, three were in Florida and one each in South Carolina, California, and Hawaii.



LOCKHEED AIRCRAFT CORP.

Tank above was designed to study the sounds emitted by porpoises. Scientists have identified 18 sounds made by the mammals which presumably form a system of communication.

Dr. P. W. Gilbert has been studying shark behavior in special enclosures at the Lerner Marine Laboratory, Bimini, Bahamas. He believes that their highly developed eyes are important in food-seeking at distances of 50 feet or less in clear water, but that their sense of smell is also very important. Dr. R. E. Sheldon, working at Woods Hole, Mass., has shown that they may detect some substances in a concentration of less than one part per million of water by this keen sense, which may function a quarter mile or more from the source. Sharks are attracted by sounds and vibrations at much greater distances by their lateral line sense organ. Despite concerted efforts there is as yet no known practical shark repellant.

Antarctic Biology.—As a result of the work of scientists of several nations, but especially those associated with the U.S. Antarctic Research Program, much has been learned of the unique marine populations around Antarctica. Plant plankton, the basic producers in these fertile waters, support a teeming population of a red shrimplike crustacean (krill) which serves as food for many other animals, including whales, seals, penguins and other sea birds, and fish. Dr. R. C. Murphy warned that a catastrophic destruction of many of the animals of this biologically distinctive area could occur in a short time if predators were accidentally introduced—even escaped sled dogs.

Luminescent Organisms.—Two biologists of the Haskins Laboratory in New York succeeded in culturing the one-celled plankton dinoflagellate, responsible for the famous bioluminescence of Phosphorescent Bay, Puerto Rico. By growing these organisms in the laboratory, much will be learned of their physiology and ecology and why they make the waters of this bay glow so brilliantly. The organisms are close relatives of those causing the destructive red tides that have occurred along the Florida coast and elsewhere.

Octopus That Drills.—Biologists at the Scripps Institution of Oceanography in California have reported that at least two species of octopus are able to drill a hole through the shell of a mollusk, inject a venom, and then eat the mollusk when the muscles relax and the shell gapes.

Indian Ocean Expedition.—Former President Harry S Truman's yacht *Williamsburg* will become the United States biological vessel of the International Indian Ocean Expedition. It will undertake a series of cruises in 1963 and 1964 with scientists representing virtually every aspect of marine biology. Following its conversion for oceanographic research, the vessel was renamed *Anton Bruun* in honor of a noted Danish biological oceanographer.

HAROLD J. HUMM,
Department of Botany, Duke University.

MARINE CORPS, U.S.

Three major events in 1962 highlighted the activities of the U.S. Marine Corps, which, under Gen. David M. Shoup, the corps' 22d commandant, continued to serve as the nation's amphibious force-in-readiness. These were the orbital flight of Marine Lt. Col. John H. Glenn, Jr.; the landing of Marines in Thailand; and the Marines' participation in the Cuban crisis alert.

On February 20, Colonel Glenn completed a three-orbit flight aboard his space capsule, *Friendship 7*. A 20-year veteran of Marine aviation, he became the first American to orbit the earth. (See also SPACE FLIGHT.)

In May, 3,000 combat-ready Marines landed in Thailand after President Kennedy announced the United States decision to assist the Thai in protecting their territorial integrity. The force, composed of the 3d Marine Division and the 1st Marine Aircraft Wing, was withdrawn in July when the crisis abated. Similarly, a Marine helicopter squadron moved into South Vietnam in early 1962 to help meet Communist aggression.

In late October, Marine Corps units were alerted for a possible move into the Caribbean area in connection with the quarantine of Cuba. At the same time, the secretary of the Navy ordered extensions in service of Marines whose tours would have expired before Feb. 28, 1963.

In a reorganization of Marine Corps reserve forces on July 1, a fourth division and air wing were formed within the Organized Reserve structure. The move affected nearly one half of the 45,000 Reservists who stand ready to augment the three Regular divisions and air wings.

Throughout 1962 the Marine Corps maintained its authorized active duty strength of 190,000 of-

ficers and men. Nearly two thirds of this number served in the corps' Atlantic and Pacific Marine Fleet Forces. Principal combat units with the Pacific component included: Force Troops Pacific, based at Twentynine Palms, Calif.; three integrated air-ground teams composed of the 1st Marine Division, Camp Pendleton, Calif., and the 3d Marine Aircraft Wing, El Toro, Calif.; the 3d Marine Division minus one reinforced infantry regiment, Okinawa; the 1st Marine Aircraft Wing minus one air group, Japan; and the 1st Marine Brigade, Kaneohe Bay, Hawaii.

The Fleet Marine Force, Atlantic, based on the east coast of the United States, included Force Troops Atlantic and the 2d Marine Division at Camp Lejeune, N.C., and the 2d Marine Aircraft Wing at Cherry Point, N.C.

In addition, battalion landing teams operated with the Seventh Fleet in the Far East and the Sixth Fleet in the Mediterranean. A battalion landing team and an aircraft squadron were stationed in the Caribbean.

(Information for the foregoing article was furnished by Headquarters, U.S. Marine Corps.)

MARITIME ADMINISTRATION. See MERCHANT MARINE.

MARRIAGE AND DIVORCE

In 1962, for the first time in several years, there was a substantial increase in marriages relative to the increase in population in the United States, according to figures for the first five months. During the previous five years, marriages either declined in proportion to the increase in population or remained static.

Marriage Data.—The marriage rate in the United States in 1962 was little more than half that of the immediate postwar years. In 1946 there were 16.4 marriages per thousand population, compared with 8.6 in 1962. During 18 of the preceding 23 years, the marriage rate was higher than in 1962.

It was expected that during the next few years, barring a severe economic setback, new family formation would increase at a rapid rate. With the new supply of manpower in the productive ages and new family formation, an unprecedented demand for housing and land was expected. Business in the area of household furnishings, appliances, children's clothes, toys, etc., was expected to expand greatly, along with demand for professional services and school and church facilities.

U.S. MARRIAGE AND DIVORCE DATA, 1958–62

	Marriages			Divorces		
Year	Number of marriage licenses[1]	Rate per 1,000 pop.	Percentage change	Number of divorces[1]	Rate per 1,000 pop.	Percentage change
1962	1,603,000[2]	8.6	1.2	401,000[3]	2.2	−4.3
1961	1,547,000	8.5	0.0	420,000	2.3	0.0
1960	1,528,000	8.5	0.0	409,000	2.3	3.3
1959	1,506,000	8.5	1.2	396,000	2.2	4.8
1958	1,451,000	8.4	−5.6	368,000	2.1	−4.5

[1] Based on population excluding armed forces overseas. [2] Estimates based on licenses issued during the first five months. [3] Estimate based on divorces in 34 states for the first five months; divorce figures include annulments.

Divorce.—The divorce rate in the United States fell during the first five months of 1962 by 4.3%. It was only about half as high, in ratio to population, as in 1946, the peak year, when there were 610,000 divorces. It appeared on the basis of available figures that divorces during 1962 would be the lowest in number since 1959.

Canada.—The marriage rate in Canada declined in 1962. Although Canada had a large youth group, many marriages apparently were deferred because of depressed economic conditions. The number of marriages fell from 132,474 in 1959 to 130,338 in 1960 and 128,475 in 1961.

The Canadian divorce rate is only a fraction of that of the United States, and the trend is downward. In 1960 there were 6,870 divorces in Canada, a rate of 0.39 per thousand. In 1961 there were 6,486 divorces, a rate of 0.36 per thousand. The postwar peak in Canada was 0.66, in 1946. Rates in Canada in 1962 ranged from 0.13 in Newfoundland to 1.64 in the Yukon.

PAUL H. LANDIS,
State Professor of Sociology,
Washington State University.

MARS. See Index entry.

MARSHALL ISLANDS. See PACIFIC ISLANDS.

MARTINIQUE

A French overseas department, Martinique is an island in the Caribbean Sea, southeast of Puerto Rico. It has an area of 425 square miles and a population (1961 est.) of 276,000, mainly of Negro-Carib-European descent. Fort-de-France (pop. est., 70,000) is the capital and chief city.

The department is administered by a French-appointed prefect (Michel Grollemund) and a 36-member General Council which is elected by universal suffrage. The 1960 budget was balanced at 6,400 million francs (493.7 francs equal the U.S. dollar). In 1961 there were 215 elementary schools (with 63,470 pupils), 2 secondary schools (3,043 pupils), and a technical college (854 students). The Institute of Juridical Studies had 246 students.

Chief cash crops and 1961 exports (in metric tons): bananas, 137,755; sugar, 74,344; and rum, 11,931. Total exports, 1961: 16,584 million francs; imports, 25,086 million. About 75% of the imports came from France, which bought nearly all of Martinique's exports. There are about 700 miles of roads on the island. Lamentin Airport handles jet aircraft.

MARYLAND

A Middle Atlantic state of the United States, Maryland ranks 42d among the states in area (land, 9,874 square miles; inland water, 703) and 21st in population (3,191,000 on July 1, 1962, a 2.9% increase from the 1960 census figure of 3,100,689). Urban places with populations above 15,000 in 1960:

Annapolis (*capital*)	23,385	Loch Raven[1]	23,278
Arbutus-Halethorpe-Relay[1]	22,402	Parkville-Carney[1]	27,236
Baltimore	939,024	Pikesville[1]	18,737
Bethesda[1]	56,527	Rockville	26,090
Catonsville[1]	37,372	Salisbury	16,302
College Park	18,482	Silver Spring[1]	66,348
Cumberland	33,415	Stoneleigh-Rodgers Forge[1]	15,645
Dundalk[1]	82,428	Takoma Park	16,799
Essex[1]	35,205	Towson[1]	19,090
Frederick	21,744	Wheaton[1]	54,635
Hagerstown	36,660	Woodlawn-Rockdale-Milford Mills[1]	19,254
Hillcrest Heights[1]	15,295		
Hyattsville	15,168		

[1] Unincorporated place.

Government.—Chief executive and judicial officers in 1962 included J. Millard Tawes (Democrat), governor, serving a four-year term; Lloyd L. Simpkins, secretary of state; Hooper S. Miles, treasurer; Leo J. Parr, auditor; Thomas B. Finan, attorney general; Thomas G. Pullen, superintendent of education; and Frederick W. Brune, chief justice of the 7-member Court of Appeals.

The Maryland General Assembly, which convenes annually, comprised 26 Democrats and 3 Republicans in the Senate in 1962 and 116 Democrats and 7 Republicans in the House of Delegates.

Legislation, 1962.—Major bills enacted by the General Assembly in a 30-day session included: a plan to set up a program for insuring accounts in savings and loan associa-

tions; a bill to regulate the home improvement industry; an act providing for more stringent regulations for the sale of stocks and bonds; a tightening of referendum procedures by requiring an increase in the number of signatures; and a $556 million budget, carrying no tax increase.

The legislators voted a pay increase for themselves (a measure rejected at the polls in November), and provided salary increases for circuit judges, teachers, and state classified workers. The legislature voted $5 million in state matching funds to help localities build junior colleges.

Governor Tawes called the General Assembly into special session in late May as a result of a decision of the Court of Appeals on reapportionment in the state. The Assembly enacted a stopgap measure which provided for four additional delegates each for Montgomery and Prince Georges counties, seven for Baltimore County, three for Baltimore City, and one for Anne Arundel County. Unless the General Assembly authorizes and the voters approve a permanent constitutional change by 1966, the House of Delegates will return to its present membership of 123 members in 1970. No provision was made to change the composition of the Senate. (See also below, *Events, 1962.*)

Finance.—In the 1962 fiscal year, revenue of $566,599,000 included $430,643,000 from state taxes and $84,228,000 in federal funds. Chief tax yields were the 3% general sales tax ($90,965,000) and taxes on individual incomes ($99,423,000) and motor fuels ($58,316,000). Spending of $552,135,000 included $156,215,000 for education, $112,351,000 for health, welfare, and safety, and $131,612,000 for highways.

Education.—In the 1960–61 school year, public elementary schools staffed by 12,977 teachers enrolled 357,708 pupils; junior and senior high schools with 11,655 teachers enrolled 249,101; and private and parochial schools with 4,643 teachers enrolled 132,067. College enrollment totaled 54,686 in 44 institutions, including 15 junior colleges and 29 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $346.2 million, including current expenditures of $258.4 million ($443 per pupil) and capital outlays of $70 million. Revenue of $346,150,000 was drawn chiefly from state funds ($105,370,000) and local districts ($162,180,000). Teachers' salaries averaged $5,940 (high school, $6,000; elementary, $5,900). Actual spending for higher education (1961 fiscal year) totaled $45,820,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 71,163 persons totaled $28,625,693. This amount included $16,065,787 for dependent children (exclusive of foster care payments) and $5,760,075 for the aged.

Transportation and Communications.—With 106 miles of highway construction and reconstruction completed during 1961, *highways and roads* on Dec. 31, 1961, totaled 18,973 miles (14,957 surfaced). These served 1,413,400 *motor vehicles* (as registered on Aug. 31, 1962), including 1,016,587 automobiles. Operating in the state in 1962 were 13 *railroads* (using 1,320 line miles of track); 13 regularly scheduled *airlines* and 46 commercial and municipal *airports*.

Communications media included (1962) 40 AM and 23 FM *radio stations;* 1 UHF and 3 VHF *television stations;* (1961) 12 daily *newspapers* (circulation, 749,299); and (Jan. 1, 1962) 362,500 business and 1,029,700 residential *telephones*.

Labor Force.—The state's labor force in June 1962 included 52,300 agricultural workers. Nonagricultural employment totaled 1,057,200, compared with 1,032,500 a year earlier and an average of 1,030,100 for the 12 intervening months. Of nonfarm employees, 24.5% were in manufacturing, 19.2% in trade, and 14.9% in government services. Unemployment in June 1962 stood at 60,700, compared with 71,500 a year earlier.

Manufacturing.—Manufacturing engaged an average of 255,881 persons in 1961 and provided a payroll of $1,387,541,425, according to the Maryland Department of Employment Security.

LEADING MARYLAND MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Totals	*255,224*	*$1,338,814*	*$2,680,887*

Apparel and related products	21,502	73,503	132,478
Nonelectrical machinery	11,219	65,620	130,579
Printing and publishing	13,169	72,456	121,456

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Fisheries.—The commercial fish and shellfish catch in 1961 totaled 66,478,773 pounds, valued at $12,778,189. Leading species were oysters (10,332,040 pounds valued at $7,802,392), crabs (29,350,590; $2,081,013), and clams (5,219,532; $1,453,942).

Mining.—In 1961, Maryland ranked 36th among the states in the value of its mineral output, with 0.34% of the national total. The total value, $62,264,000, was 12% higher than in 1960. Maryland was second in output of marl, and fifth in potassium salts. Leading minerals were stone (valued at $21,153,000) and sand and gravel ($16,894,000).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $204,155,000, compared with $200,177,000 for the corresponding period of 1961. For the full year 1961, income comprised $180,013,000 from livestock, $96,367,000 from crops, and $5,873,000 in government payments. Principal income sources in 1961 were wholesale milk, $70,568,000; broilers, $58,947,000; cattle, $28,955,000; and tobacco, $22,092,000.

The state's 25,000 farms in 1959 had an acreage of 3,457,000 (1,456,000 in harvested cropland). Livestock on farms included (Jan. 1, 1962) 498,000 cattle, 194,000 hogs, 1,770,000 chickens, and (1961) 107,953,000 broilers. An average of 38,000 family and 18,000 hired workers engaged in farming during 1961.

MARYLAND CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	1,270	1,600	1,350
Beans, snap (1,000 cwt.)	96	116	101
Corn for grain (1,000 bu.)	20,892	22,140	21,240
Peaches (1,000 bu.)	469	420	450
Soybeans (1,000 bu.)	3,413	6,168	5,740
Tomatoes (1,000 cwt.)	280	260	270
Tobacco (1,000 lb.)	36,961	38,400	39,425
Wheat (1,000 bu.)	4,637	3,692	3,483

(Source: U.S. Department of Agriculture.)

Events, 1962.—In the general election of November 6, Gov. J. Millard Tawes, Democrat, was reelected and Rep. Daniel B. Brewster, 39-year-old Democrat, won the seat in the U.S. Senate vacated by retiring Republican Sen. John Marshall Butler. Tawes scored easily over former Rep. Frank Small, Jr., and Brewster polled 62% of the vote against Edward T. Miller, also a former congressman. The Democrats also won the state offices of comptroller and attorney general.

Maryland's new seat in the U.S. House of Representatives, run on an at-large basis, was won by Democrat Carlton R. Sickles. The Republicans' only House incumbent, Rep. Charles Mathias, was reelected, and the GOP added another seat when Rogers C. B. Morton ousted Democrat Thomas F. Johnson, who was under federal indictment in connection with the state's savings and loan scandals.

In the General Assembly, the Republicans picked up 4 seats in the Senate and 18 seats in the House of Delegates. Republicans now number 7 in the 29-member Senate and 25 in the 142-seat House of Delegates.

A congressional redistricting plan passed by the General Assembly in 1961, which would have set up a new 8th Congressional District comprising Prince Georges and Howard counties, was defeated by the voters. The General Assembly must now devise a new plan or leave the new seat to be filled on an at-large basis indefinitely. Voters turned down a pay raise for members of the General Assembly, and approved a tightening of insurance

laws and legislation increasing requirements to petition acts of the General Assembly to referendum.

The Maryland Court of Appeals in April ordered the Circuit Court of Anne Arundel County, where a reapportionment suit had been brought, to determine whether the state's urban voters suffered "invidious discrimination" in the apportionment of the General Assembly. This decision paved the way for a special session of the General Assembly which passed legislation reapportioning the House of Delegates (see above, *Legislation, 1962*). In July the Court of Appeals rejected a plea for greater suburban representation in the state Senate, ruling that population does not have to be taken into account in assigning Senate membership. The Maryland Committee for Fair Representation planned to appeal the decision to the U.S. Supreme Court. (See also REAPPORTIONMENT AND REDISTRICTING.)

Governor Tawes named a commission, headed by Professor Franklin L. Burdette of the University of Maryland, to draft a permanent reapportionment plan for submission to the General Assembly at its 1963 session. The permanent measure would be in the form of a constitutional amendment.

Lynn	94,478	Woburn	31,214
Malden	57,676	Worcester	186,587

Government.—Chief executive and judicial officers in 1962 included John A. Volpe (Republican), governor, serving a two-year term; Edward F. McLaughlin, lieutenant governor; Kevin H. White, secretary of state; John T. Driscoll, treasurer; Thomas J. Buckley, auditor; Edward J. McCormack, Jr., attorney general; Owen B. Kiernan, commissioner of education; and Raymond S. Wilkins, chief justice of the 7-member Supreme Judicial Court.

The Massachusetts General Court (legislature), which convenes annually, comprised 25 Democrats and 15 Republicans in the Senate in 1962 and 150 Democrats, 84 Republicans, and 6 vacancies in the House of Representatives.

Legislation, 1962.—The General Court adjourned on July 27 after passing a record budget of $516,048,183. Bond issues amounting to $210,275,000 also were voted.

Some of the most notable bills passed related to public higher education. The University of Massachusetts was given fiscal autonomy from state agency control, and the other educational institutions gained greater freedom in hiring professional staff members. A medical school was established as part of the university, and the authorized enrollment at state institutions was increased from 17,180 to 21,989. On the elementary and secondary schools level, minimum salaries of schoolteachers were increased.

The code-of-ethics legislation passed in 1961 was strengthened, and a recommendation by Governor Volpe that a seven-member crime commission be established was approved. Governor Volpe also secured passage of a bill to audit the books of the Massachusetts Turnpike Authority and the Massachusetts Parking Authority, and vetoed a bill to give the Turnpike Authority control over the leasing of "air space rights" for buildings constructed over the toll-road extension into Boston.

The law covering political contributions and expenditures was revised to require candidates to make periodic reports during the campaign. A compromise was reached on another matter, the reapportionment of congressional districts. The state's delegation to the House of Representatives was reduced from 14 to 12, with one Democratic and one Republican seat being eliminated.

The Commission on Administration and Finance was reorganized into the Executive Office on Administration and Finance, working directly under the governor. Laws governing business activities on Sunday were liberalized, but Sabbatarians lost their fight for the Sunday opening of businesses which are closed for religious reasons on Saturday. Efforts to bring about a popularly elected constitutional convention were defeated, as were bills to legalize "beano," a state lottery, and off-track betting.

The state minimum wage was increased from $1.15 to $1.25 an hour (effective September 1963), and higher workmen's compensation benefits were approved.

Finance.—In the 1962 fiscal year, revenue of $730,878,785 included $399,315,171 from state taxes and $187,172,331 in federal funds. Chief tax yields were from individual incomes ($112,587,188), corporate incomes ($52,900,430), and motor vehicles ($81,850,347). Spending of $720,818,348 included $105,344,229 for education, $263,212,687 for health, welfare, and correction, and $157,103,921 for highways and waterways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 21,190 teachers enrolled 604,000 pupils; secondary schools with 15,350 teachers enrolled 344,000; and parochial schools with 7,080 teachers enrolled 234,166. College enrollment totaled 138,167.

Estimated public school spending in the 1961–62 school year totaled $430.9 million, including current expenditures of $380 million ($450 per pupil) and capital outlays of $48 million. Revenue of $382 million was drawn chiefly from state funds ($93 million) and local districts ($270 million). Teachers' salaries averaged $5,775 (high school, $5,975; elementary, $5,625). Actual spending for higher education (1961 fiscal year) totaled $30,447,000.

Public Assistance.—In the 1961 fiscal year, public assistance payments to a monthly average of 115,185 persons totaled $155,999,924. This amount included $76,182,368 for the aged and $28,542,287 for dependent children.

Transportation and Communications.—With 197 miles of highway construction and reconstruction completed in 1961, *highways and roads* on Dec. 31, 1961, totaled 26,440 miles (24,440 surfaced). These served 1,876,906 *motor vehicles* (as registered on Aug. 31, 1962), including 1,665,020 automobiles. Operating in the state were (1960) 8 *railroads* (using 1,506 line miles of track); (1962) 14 regularly scheduled *airlines;* and 47 commercial and municipal *airports* and 4 seaplane bases.

Communications media included (1962) 59 AM and 39 FM *radio stations;* 4 VHF and 6 UHF *television stations;* (1961) 50 daily *newspapers* (circulation, 2,386,572); and (Jan. 1, 1962) 701,800 business and 1,752,100 residential *telephones.*

Labor Force.—The state's labor force on July 15, 1962, included a total of 1,949,600 nonagricultural

Edward Kennedy (left) and Edward McCormack, rivals for the Massachusetts Democratic senatorial nomination, debate on August 27. Kennedy won nomination and November 6 election.

WIDE WORLD

workers, compared with 1,939,700 a year earlier and an average of 1,936,300 for the 12 intervening months. Of nonfarm employees, 34.4% were in manufacturing, 20.2% in trade, and 16.9% in service industries. Unemployment on June 15, 1962, stood at 122,500, compared with 140,900 a year earlier.

Manufacturing.—Manufacturing engaged an average of 492,002 workers in 1960 and provided a payroll of $2,056,791,692. The value of products manufactured in the state totaled $10,565,422,271.

LEADING MASSACHUSETTS MANUFACTURES, 1960

Industry	Persons employed	Gross wages (in thousands)	Value of product[1] (in thousands)
Electrical machinery	51,562	$223,090	$1,100,846
Foundry & machine-shop products	23,211	113,943	461,438
Boots and shoes (nonrubber)	34,900	112,880	397,365
Women's clothing	25,923	69,978	323,443

Woolen and worsted goods	11,386	42,373	193,343

[1] FOB plant. (Source: Massachusetts Department of Labor and Industries, Division of Statistics.)

Mining.—Massachusetts ranked 42d among the states in the value of its mineral output in 1961, with 0.17% of the national total. It was fourth in production of sheet mica. Nearly all of the total value ($30,234,000) was represented by sand and gravel ($14,958,000) and stone ($13,399,000).

Fisheries.—The commercial fish and shellfish catch at Massachusetts ports in 1961 totaled 431,643,662 pounds valued at $32,900,189. Leading species were haddock (114,412,527 pounds valued at $9,662,241) and scallops (21,034,227; $8,009,852).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $110,482,000, compared with $111,872,000 for the corresponding period of 1961. For the full year 1961, income comprised $94,594,000 from livestock, $57,062,000 from crops, and $638,000 in government payments. Principal income sources in 1961 were wholesale milk, $39,130,000, and eggs, $25,342,000.

The state's 11,000 farms in 1959 had an acreage of 1,142,000 (291,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 153,000 cattle and 3,152,000 chickens.

MASSACHUSETTS CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	2,450	3,150	2,900
Corn for grain (1,000 bu.)	185	124	136
Cranberries (bbl.)	578,900	472,000	770,000
Potatoes (1,000 cwt.)	1,260	1,511	1,408

Tomatoes (1,000 cwt.)	256	209	214

(Source: U.S. Department of Agriculture.)

Events, 1962.—The Massachusetts general elections of 1962 attracted national attention, especially with respect to the contest to fill the U.S. Senate seat vacated by President Kennedy and temporarily filled by Benjamin A. Smith. In the Democratic primary on September 18, the president's brother, Edward M. Kennedy, 30, defeated Attorney General Edward J. McCormack, Jr., nephew of House Speaker John W. McCormack. At the same time, George Cabot Lodge, son of former Senator and UN Ambassador Henry Cabot Lodge, won the Republican nomination from Rep. Laurence Curtis. In the November 6 election, Kennedy defeated Lodge, 1,162,611 to 877,669. An independent candidate, H. Stuart Hughes, Harvard professor who campaigned on a platform of nuclear disarmament, received 50,013 votes.

In the gubernatorial election, the Democratic candidate, Endicott Peabody, won a narrow victory over the Republican incumbent, John A. Volpe. After a recount, Peabody's margin was established at 5,431 votes. Democrats won the other statewide contests, with the exception of that for attorney general, in which Republican Edward W. Brooke became the first Negro elected to state office. The Democrats retained control of both houses of the General Court by wide margins, increasing their Senate seats by 3 (giving them 28 out of 40), but losing 3 House seats to reduce their superiority to 150–90.

The voters also rejected a constitutional amendment which would have permitted graduation of the income tax, and repealed a pay increase for the legislators.

At various times of the year, public attention was focused on charges of corrupt activities. State Rep. Harrison Chadwick was censured by the General Court for asserting on a nationwide television program that some legislators were connected with illegal bookmaking. State Rep. Charles Iannello served four months in jail in connection with the Metropolitan District Commission scandal. Six men were indicted and charged with fraudulent acts in relation to the Massachusetts Parking Authority, which operates the garage under the Boston Common.

Transportation difficulties also made news at times during the year, including a strike against the Metropolitan Transit Authority in March. The Mass Transportation Commission announced an experimental plan costing a total of $10,200,000, three fourths of which was provided by the federal government.

The economy of the state was at a generally prosperous level, with employment in defense-related industries and communications equipment gradually increasing. Some communities, notably in Bristol and Essex counties, participated in programs operated under the Area Redevelopment Act.

Studies of major state problems by special commissions began or were continued, including a survey of the entire educational system in the state and an investigation of the need for revising the state constitution. The Board of Regional Community Colleges opened a two-year college at Greenfield, and the University of Massachusetts announced a ten-year expansion plan with an estimated cost of $121,500,000.

The largest mail robbery in history occurred in Plymouth on August 14 when a mail truck was robbed of $1,551,277.

MATHEMATICS

The quadrennial International Congress of Mathematicians met in 1962 in Stockholm. The 2,400 mathematicians attending represented most of the countries where mathematical research is pursued. At every such congress two young mathematicians are awarded the Fields Medals for research conducted during the preceding four years. In 1962 the medals were awarded to John W. Mil-

nor of the United States and L. Hörmander of Sweden.

For the third successive congress, the new field of topology of differentiable manifolds has been represented—this time by medalist John W. Milnor of the United States. The importance of this field was already clear from the work of the Frenchman Henri Poincaré around 1900. Poincaré was seeking answers to questions about mechanical systems, especially systems of planets interacting by gravitational attraction: Does the system have motions which can repeat indefinitely, that is, which are periodic and stable? If the planets are not moving periodically, are there nevertheless configurations to which they will keep returning?

Despite its long history, this field is thought of as new because its status as a major independent branch of mathematics is recent. Its systematic treatment achieved some quick successes. Thus, all the compact 2-dimensional manifolds (beginning with sphere and doughnut-shaped torus) have long been known. Unexpectedly, even 3-dimensional manifolds proved intractable by methods such as Poincaré's, yet manifolds of 6 and more dimensions are required in analyzing even comparatively simple mechanical systems. The American J. W. Alexander and others produced ingenious counterexamples showing that generalizations which their contemporaries wished to prove were unfortunately false.

The devastating counterexample is also Milnor's hallmark. He showed in 1955 that two differentiable manifolds, though indistinguishable as topological spaces, could be essentially distinct in their differential properties; in 1961 he showed that they could even be decomposed into triangles, tetrahedrons, etc., in essentially irreconcilable ways. His proofs were by explicit description of manifolds of 7 and more dimensions, exhibiting phenomena to which no 3-dimensional intuition could be a guide. Milnor's ease in extra dimensions has been acquired by others, and there were reports at Stockholm on such subjects as knots in space of more than 3 dimensions. The "string" for such knots must be of more than the usual one dimension.

Today the fields of topology and measure theory, after a long period of independent development, are being brought to bear again on the problems of classical mechanics which inspired them. Advances of this sort were reported at Stockholm by S. Smale of the United States and Y. G. Sinai of the USSR.

Similarly, functional analysis, inspired before 1910 by the search for solutions of the differential equations of continuum mechanics and field theory, has returned lately to its starting point. In the past, mathematicians dealt primarily with functions belonging to Banach spaces (named in honor of the Polish mathematician S. Banach). Today the broader classes of generalized functions are utilized, of the kind introduced by the Russian S. L. Sobolev and the Frenchman L. Schwartz. Much new information is obtained concerning the existence and properties of solutions not yet computed, and methods by which to compute them. The second Fields Medal at the Stockholm Congress was awarded to L. Hörmander of Sweden for his leading role in this work.

The welter of new existence proofs created a mood of confidence which was shattered five years ago by the American H. Lewy. He showed that a certain linear partial differential equation—apparently quite innocuous—had no solutions whatever. Among his other contributions, Hörmander has greatly elucidated Lewy's example. Hörmander has set it into the context of a large class of differential equations for which no function, or even generalized function, is a solution.

CHANDLER DAVIS,
Associate Professor of Mathematics, University of Toronto.

MATTEI, Enrico

Italian industrialist and government official: b. Acqualagna, Italy, April 22, 1906; d. (in an airplane crash) near Milan, Oct. 27, 1962.

The son of an officer in the national police, Mattei began working when he was 14, and by the time he had reached his early 30's was operating a successful chemical firm near Milan. He joined the underground in World War II; by 1945 he was in command of the partisan forces in northern Italy. He was elected to Italy's first republican Parliament in 1945 as a member of the Christian Democratic Party. In the same year he was named northern commissioner of the Azienda Generale Italiana Petroli (Italian General Petroleum Agency), and soon headed the organization. Ordered to liquidate its assets, he continued instead to search for a source of fuel; in 1946 large methane deposits were found in Lombardy and near Milan. Appointed president of the newly organized Enze Nationale Idrocarburi (ENI, National Hydrocarbons Authority) in 1953, Mattei began formulating the exclusion of foreign oil companies from Italy, and turned ENI into a monopoly. Italy's oil production increased from 64 million cubic feet in 1946 to 5 billion cubic feet by 1958.

After being excluded (1954) from an Anglo-French-American-Dutch consortium in Iran, Mattei in 1955 obtained a drilling concession in the Sinai Peninsula from Egyptian President Gamal Abdel Nasser. He subsequently extended his operations to Iran, Sudan, Lybia, Tunisia, Somalia, Morocco, and Argentina. All of his agreements were based on a 75–25 division of royalties, with 75% remaining in the country of origin; this was a radical departure from the traditional 50–50 agreements negotiated by other Western powers. Mattei became one of the most powerful oil men in the world.

Wielding enormous political power in Italy, Mattei preferred to remain in relative obscurity. ENI owns gasoline stations, restaurants, an atomic power plant, and various factories, and Mattei had firm control of patronage. Yet he chose never to seek public office, and refused in 1959 to seek the prime ministership after the fall of a government headed by Amintore Fanfani.

MAURITANIA

Situated on the northwestern coast of Africa, the Islamic Republic of Mauritania has an estimated area of 419,229 square miles and a population (1960 est.) of 740,000. The majority of the population are nomadic Moors; a large minority of Negroes (Tukulör, Sarakolle, and Fulani) live in the Senegal Valley. The capital is Nouakchott (1961 est. pop., 6,000), a coastal village which is being reconstructed into a modern city. The national language is Arabic; the official language is French.

Government.—A former French overseas territory of French West Africa, Mauritania became independent on Nov. 28, 1960, and was admitted to the United Nations on Oct. 27, 1961. Executive power is vested in a president (Mokhtar Ould Daddah, elected Aug. 20, 1961); legislative power is in the hands of the unicameral National Assembly, whose 40 members were elected for five-year terms by universal suffrage on May 17, 1959. All the members of the National Assembly were members of the Mauritanian Regroupment Party, which united in Decem-

ber 1961 with all opposition parties to form a national political group known as the Party of the People.

Education and Religion.—School enrollment in 1958 constituted only 7.2% of the school-age population. Number of schools (with enrollments), 1960: 300 primary (9,000); 15 secondary (400). Islam is the state religion, but freedom of worship is guaranteed.

Finance.—Government revenue, 1962 est.: 2,481 million francs CFA; expenditure, 4,281 million; grant-in-aid from France, 1,800 million (246.85 francs CFA equal U.S.$1). In early 1962 the government established a development bank, with an initial capital of $608,000, of which Mauritania subscribed 58% and France 34%. Investment, 1961: authorized, 103 million French francs (31.7 million in 1960); expended, 49.8 million (9.59 million in 1960).

Transportation and Communications.—Transport is mainly by pack caravan, as there are no public railroads. Permanent dirt roads in 1958 aggregated 1,546 miles, including the 850-mile Trans-Mauritanian Highway. Port traffic, 1961: 152,000 tons. Motor vehicles number 1,300 (1957); radio receivers, 5,000 (1959).

Production.—The economy is based on subsistence farming and animal husbandry. Chief crops (with annual production estimates in metric tons): millet (100,000), dates (15,000), gum arabic (3,000), corn, rice, sweet potatoes, and peanuts. Marine products (metric tons, 1960): fresh fish (30,000), lobsters (1,300), lobster tails (700).

Foreign Trade.—Total exports, first 9 months of 1961: 351 million francs CFA; imports, 6,025 million. Chief export (in million francs CFA): fish (217); chief imports: iron and steel products (1,321), other metal products (614), automobiles (468). Principal customers: France and other countries in the franc zone; principal suppliers, France and the United States.

Events, 1962.—Mauritania's relations with neighboring Morocco and Mali remained strained during the year, as both countries continued to press their territorial claims against Mauritania. On May 2, three Mauritanian soldiers were executed and 21 sentenced to prison for an attack on a French officers' club in Nema, in southeastern Mauritania. It was claimed by Mauritania that the attack was inspired by Morocco and launched from a base in Mali.

Work continued during the year on Mauritania's major development projects: the iron deposits at Fort-Gouraud, being developed by Miferma (Société des Mines de Fer de Mauritanie); the copper deposits at Akjoujt, being developed by Micuma (Société des Mines de Cuivre de Mauritania); the 419-mile railroad from Fort-Gouraud to Port Étienne; and port facilities at Port Étienne.

J. L. L.

MAURITIUS

This densely populated British colony lies 500 miles east of Madagascar in the Indian Ocean. It comprises the island of Mauritius (area, 720 square miles) and several widely scattered island dependencies: Rodrigues (42 square miles; 1961 pop. est., 18,000); Diego Garcia (area, 11 square miles; pop. est., 650); and other coral island groups (aggregate area, 34 square miles). The total population (Dec. 31, 1961, est.) numbers 687,000, of whom 454,250 are Indo-Mauritians. Port Louis (pop. est. 113,065, including suburbs) is the capital and chief port. English and French are the official languages; Creole is the principal spoken language.

The colony is administered by a governor (John S. Rennie succeeded Sir Colville M. Deverell in September 1962). He is assisted by a 12-member Executive Council headed by a chief minister (S. Ramgoolam), and a 55-member Legislative Council (40 elected). Government revenue for 1962–63 was estimated at Rs.165,442,700; expenditure, Rs.164,965,460 (the Mauritius rupee equals U.S.$0.21). In 1961 the government conducted 120 primary, 3 secondary, 1 teacher-training, and 3 technical schools and 1 college, and aided 76 primary and 8 secondary schools (totaling 118,740 pupils). There were also 486 unaided primary and secondary schools (with 34,656 pupils). Transportation facilities include 77 miles of railroads, 740 miles of roads, and 15,669 motor vehicles. The airport at Plaisance is served by three foreign airlines.

Production of sugarcane, the principal crop, totaled 553,000 metric tons in 1961 (up 135% over 1960). Other crops include tea, aloe fiber, tobacco, and corn. Rum, soap, and matches are the chief manufactures. Total exports, 1961: £22 million; imports, £24 million. Chief exports: sugar (Rs.272,190,515), molasses (Rs.4,987,507), and tea (Rs.4,904,063).

MEAT INDUSTRY

The meat packing and processing industry in the United States buys the bulk of the livestock produced on nearly 4 million farms and ranches and provides farmers with approximately one third of their annual cash income. The industry includes the following: about 60 large terminal markets and several hundred markets of smaller size at which livestock is sold; approximately 2,800 meat packing plants and 1,500 meat processing plants; about 5,000 wholesale meat distributors; and 230,000 retail food stores at which meat is sold.

Sales of the meat industry in the United States in 1961 reached a new high of nearly $13.6 billion. Industry net earnings totaled $89 million, about six tenths of 1 cent per dollar of sales.

Meat production in the United States in 1962 was about 28.9 billion pounds. This included 15.5 billion pounds of beef (carcass weight), 11.6 billion pounds of pork, 1.0 billion pounds of veal, and 790 million pounds of lamb and mutton. Per capita consumption in 1962 averaged 89.0 pounds of beef, 5.5 pounds of veal, 5.0 pounds of lamb and mutton, and 63.0 pounds of pork, all of which totaled 162.5 pounds.

Generally, the United States does not export or import large quantities of meat. Foreign markets are valued by American meat packers as points of sale for such byproducts as lard, hides, and inedible fats. Additional markets for these byproducts are constantly being sought.

More than three quarters of meat production in the United States is processed in plants operated under federal inspection. The balance of the meat supply comes from plants operated under state or local regulations or is processed by farmers themselves, mainly for their own consumption.

Director, Department of Public Information, American Meat Institute.

MEDICINE

Some progress was made in 1962 toward meeting the increasing need for physicians in the United States. Two new medical schools were accredited, bringing the total in the United States and its possessions to 87. One of these was formed from a college of osteopathy. Five additional universities were said to be proceeding with plans to establish medical schools, and seven other states were listed as probable sites of future schools. It has been estimated that it will be necessary to increase the number of medical graduates by 3,500 per year, by 1970. All of the new facilities mentioned above could be expected to furnish only a fraction of this number of additional doctors.

The proposal to use federal funds for new medical schools has met some opposition for fear that this course would lead to federal domination and regulation. At present, federal funds are available to medical colleges chiefly in the form

of research grants. Some medical educators feel that the use of these plentiful funds for research activities, but not for teaching facilities, leads to excessive diversion of personnel and interests to research, resulting in an anomalous situation in which medical research is interfering with medical education.

Total enrollment in medical schools in the United States and its possessions for the year 1961–62 was 31,078, an increase of 790 students over the preceding year. All schools graduated 7,168 new doctors, 174 more than in 1961. Physicians obtaining licenses for the first time numbered 8,023 (1961), of whom 1,580 were graduates of foreign medical schools. Deaths among doctors were estimated at 3,500, giving a net increase in physicians of approximately 4,500 during 1961.

After declining for four years, the number of applicants to American medical schools was stabilized for the year 1961–62. The American Medical Association (AMA), as well as other agencies, put into operation loan plans to assist students with the heavy expenses of medical education. The AMA also assisted with loans to displaced Cuban physicians now in the United States, to facilitate postgraduate training needed for work in the United States.

The federal administration's health program for the elderly, designed to be financed by compulsory taxation under the Social Security Act, again failed to pass Congress in 1962. It appeared that the limitations of this King-Anderson bill were not well understood by the population at large. The plan came to be known popularly as Medicare, but actually it provided for only limited hospital and nursing-home care for those retired under Social Security—and this without regard to whether or not they might need financial assistance.

Medical and hospital organizations continued to support private voluntary health insurance programs, which have shown such rapid growth in recent years, as the proper means of insuring good medical care. Low-cost programs for persons over age 65 were offered by Blue Cross and Blue Shield associations, as well as by commercial companies.

Further progress was made in various states toward extending programs of medical assistance to the aged under the existing Kerr-Mills amendments of 1960 to the Social Security Act. Under this law federal funds are used to increase benefits through locally administered state plans, based on the need of individuals for financial assistance. A proposed amendment would vary the standards required for demonstration of need according to the length of illness and effect of expenses on the individual's income. (See also OLD AGE; SOCIAL SECURITY; SOCIAL WELFARE.)

Meanwhile other problems of medical care were reported from around the world. Physicians in Saskatchewan, Canada, gave notice that they would not practice under a compulsory government-controlled medical care plan, and many closed their offices for "vacation" when the plan went into effect July 1, 1962, leaving only limited personnel for free emergency medical services in hospitals. After extensive negotiations, a compromise was reached. Provisions were made to permit physicians to practice outside the state program and to allow voluntary nonprofit health insurance plans to operate in conjunction with the government program. By November it was reported that probably one tenth of the physicians of the province had moved elsewhere and that a large majority of those remaining were practicing outside the government-controlled plan. (See also SASKATCHEWAN.)

In Great Britain, as had been anticipated, an "unusually large" increase of 11.5 percent in the cost of operation of the National Health Service plan of socialized medicine in 1961 was reported. This followed an increase of 8.2 percent in 1960 and brought expenditures to $2,265,000,000 for England and Wales, as compared with $967,075,600 in the first year the plan was in operation.

Even more significant was the report in the *British Medical Journal* that for the five years 1955–60, Britain lost 600–700 physicians a year by emigration to other countries. It was said that this represented the loss of one third of the country's yearly production of new doctors, and necessitated filling many hospital appointments with foreign graduates.

The 1962 Nobel Prize in medicine and physiology was awarded jointly to Francis Harry Compton Crick of Cambridge University, Maurice Hugh Frederick Wilkins of Kings College (London), and James Dewey Watson of Harvard University. The award was made for discoveries concerning the molecular structures of nucleic acids, including the demonstration that the deoxyribonucleic acid molecule is composed of a double-strand helix. (See also NOBEL PRIZES.)

Genetics.—The nucleic acids have been in the forefront of news of medical research in genetics, viruses, and cancer for a number of years. Several Nobel prizes have been awarded in medicine and chemistry for studies related to their structure, synthesis, and function. They generally are regarded as the fundamental life substance of living cells. Deoxyribonucleic acid (DNA) is believed to carry in its structure the genetic information of the cell. Ribonucleic acid (RNA) is believed to be synthesized by DNA in such fashion as to act as the messenger and template to carry the genetic directions to the manufacturing components of cells.

In producing the complex compounds, nature begins with relatively small building blocks. Thus, proteins are made up of large numbers of simple amino acids. These are assembled first into chains or groups, which then are joined to form the large molecule. In the Watson-Crick model of the DNA molecule the two strands of the double helix are composed of sugars and phosphate groups, with four organic bases acting as bridges between the strands at intervals. RNA also contains four bases, but one of these is different from those in DNA.

The basic research reported has been described as a breakthrough in the beginning of understanding of the genetic code of cells. In connection with the synthesis of messenger RNA, it was found that a given sequence of bases in the directing DNA molecule would lead to the production of RNA with a related pattern of number and type of bases in its structure. Such synthesis presumably carries the code of directions from DNA to the messenger and template RNA. Other investigators studying the influence of RNA on synthesis of amino-acid chains demonstrated similar control. To a cell-free system containing all 20 of the amino acids, ribosomes, and other raw materials for the synthesis, they added a type of RNA containing only one base, uracil. Under these conditions only one of the 20 available amino acids, phenylalanine, was incorporated into the chain. When another base was substituted in the RNA, a different amino acid was utilized. Reports indicated that it will be possible to learn what arrangement of bases or molecular structure in the coding units of RNA controls the utilization of each amino acid in protein synthesis.

The importance of the exact regulation of incorporation of amino acids is dramatically illus-

PICTORIAL PARADE

trated by genetic "mistakes" which occur in the synthesis of amino-acid chains of the protein hemoglobin of human red blood cells. It is known that when, because of genetic defect, one of the normally present amino acids (glutamic acid) is replaced by another (valine) in its sequence along the chain, abnormal hemoglobin will result and may lead to crippling anemia. This sickle cell anemia was the first such condition identified as a "molecular disease," but more than 20 abnormal human hemoglobins now are recognized.

Fascinating experiments were described during 1962 in which red blood cells from normal individuals were caused to produce abnormal sickle cell hemoglobin when incubated with material containing RNA obtained from the bone marrow of a patient with sickle cell anemia. In the reverse experiment, RNA-containing material from normal bone marrow caused young sickle red cells to make what appeared to be normal hemoglobin. It was presumed that the alteration of hemoglobin synthesis in each case was due to the introduction of a new RNA template.

Another inherited blood disorder (genetic defect) has come to light which involves a hazard of one type, but also a presumed environmental advantage in the form of increased resistance to severe malaria. About 10 percent of Negro troops treated with a new anti-malarial drug during the Korean War became severely anemic. This increased susceptibility to the drug was traced to a deficiency in their red blood cells of an enzyme, glucose-6-phosphate dehydrogenase. In malarial infections the parasites grow inside red blood cells, and they require this enzyme. Its deficiency thus could increase resistance to the disease.

Now studies of populations in malaria-infested areas of Africa have revealed frequent occurrence of the enzyme deficiency, but the trait was rare in other areas. Therefore, by a quirk of nature in generations past, individuals with a mutant genetic defect, which would have made them more susceptible to certain chemicals if they had been exposed, were rendered more resistant to a severe disease to which they were exposed. Thus, they were able to survive the disease and transmit the enzyme deficiency to their progeny. This discovery illustrates the complexity of factors which may influence the selection of "the fittest" for survival in the evolution of a population.

With the perfection of a simple diagnostic test, a new campaign was begun to detect another genetic disease, phenylketonuria, in newborn babies. The condition occurs only rarely, but early detection is imperative. Affected children are unable to metabolize the amino acid phenylalanine, and unless diet free from this substance is instituted, severe brain damage and mental retardation are apt to result. (See also BIOCHEMISTRY; GENETICS.)

Immunity.—One of the most active areas of medical research is the study of immune reactions, auto-immune processes, and auto-immune diseases. "Rheumatoid factor" found in persons with rheumatoid arthritis has been shown to react with various fractions of the gamma globulins of the blood, which carry antibodies. A prepared antiserum against certain hemolytic streptococci was found to react strongly with human heart tissue. (Rheumatic fever follows streptococcal infections and injury to the heart is its most serious effect.) It is assumed that in rheumatic fever the body forms antibodies against components of the streptococci, but because of cross-reaction, the antibodies also damage heart tissue.

Auto-antibodies to colon tissue have been demonstrated in the blood of patients with ulcerative colitis. Experimental production of a similar disease state in dogs by injecting them with prepared colon antiserum now has been reported. Some very severe anemias are due to destruction of red blood cells by auto-immune reactions. Attempts have been made to treat such anemia with 6-mercaptopurine which, like X-ray therapy, suppresses immune reactions. However, as in its application to tumor therapy, the toxicity of the drug limits its usefulness.

One of the significant developments of 1962 was the accumulation of evidence that the thymus gland is closely concerned with mechanisms of immunity. Its function has been a mystery over the years, but it now appears that the thymus, which is active early in life, is responsible for producing lymphoid tissues capable of forming antibodies which will be needed for defense against disease. Animals from which the thymus was removed soon after birth showed "severe depletion in the lymphocyte(s) . . . and serious immunologic defects." This discovery represents another step toward understanding basic immunologic processes such as those concerned in auto-immune diseases and the rejection of tissue grafts.

Cancer.—Much work continues in the study of the possible causative relationship of viruses to human cancer. Such relationship has long been established for malignant tumors in animals. A finding of great interest was the demonstration that an adenovirus, which is known only as a cause of respiratory infection in man, could induce highly malignant tumors when injected into young hamsters. The common herpes simplex virus, which causes "fever blisters," appeared to produce more frequent skin cancers in mice when it was injected at the same time chemical carcinogens were being applied to the skin. This virus alone did not cause tumors, however.

The mouse polyoma virus is known to produce a wide variety of malignant tumors when injected into newborn mice. On the other hand, natural infection with this virus occurs widely in both laboratory and wild mice, without producing the high incidence of tumors which follows its injection into the newborn animals.

New chemicals for treatment of malignant tumors are being developed constantly. However the specific chemical cure for cancer has not been found, and drugs produce only suppression or temporary remission of tumor growth. Among experimental drugs, methyl GAG was reported as promising in the treatment of leukemia, but very toxic. A new member of the actinomycin group of antibiotics, actinomycin X2, was found to have more potent antitumor properties than related compounds, in laboratory trials. New information

also was obtained concerning the reaction of the compound with nucleic acid.

There was renewed attention to the effects of cigarette smoking on health, particularly on the development of lung cancer. A special detailed report by the Royal College of Physicians in Great Britain stated that cigarette smoking is a cause of lung cancer, although not the only cause. Restriction of cigarette advertising was recommended or put into effect in several European countries. In the United States there was pressure for governmental study and action in the matter. A special Advisory Committee on Smoking and Health, consisting of ten physicians and scientists, was appointed by the surgeon general, U.S. Public Health Service. The committee was given the responsibility for reviewing all available evidence concerning smoking and other environmental factors, such as smog, which may affect health. The members were selected to obtain as authoritative, objective, and unbiased opinions as possible. (See also CANCER; PUBLIC HEALTH.)

Drugs.—The year 1962 marked the 20th anniversary of the practical use of penicillin and the beginning of the antibiotic era in medicine. Uncounted millions of lives have been saved through the control of infections by these drugs. An important new semisynthetic penicillin, sodium oxacillin, was introduced during the year. It is the first form of penicillin to be active against resistant staphylococci when given by mouth. Other new experimental antibiotics include cephalothin (a derivative of cephalosporin C) and capromycin. The former was described as much more potent than the parent substance and active against some penicillin-resistant organisms. Capromycin proved to be useful in the treatment of tuberculosis and less toxic than streptomycin.

However, news of drugs during the year is more likely to be remembered by tragedy than by triumph. It was determined that deformities of the extremities (phocomelia) of a number of babies, chiefly in Europe, was related to the use by their mothers of a new sedative drug, thalidomide, during early pregnancy. This represented an hitherto unrecognized type of drug toxicity. Thalidomide had been tested by all standard techniques in animals and seemed to be an almost ideal sedative and sleep-producing compound, much less dangerous than the commonly used barbiturates. Therefore, its tragic effects when taken by expectant mothers were completely unexpected. Fortunately the drug was not marketed in the United States, but it was used in limited clinical trials.

It is hoped that animal studies with thalidomide may yield information concerning the causes of prenatal defects. It was emphasized that as a basic precaution, expectant mothers should take as few drugs as possible, and only on medical advice, especially during early pregnancy. (See also PEDIATRICS.)

Other significant drug reactions were reported. Two fairly widely used drugs were withdrawn from the United States market because of such effects: the anticholesterol drug Triparanol (MER-29) and an antidepressant or psychic energizer known as Monase. The occasional production of abnormal changes in the lungs by excessive exposure to cosmetic hair sprays was confirmed by the report of a larger series of cases, including three fatalities.

Under stimulus of the thalidomide reports, new drug-control legislation, which had been pending for some time, was enacted by Congress. The bill was not as broad as originally advocated, but it does grant important new regulatory powers to

U.P.I.

President Kennedy presents the nation's highest award for government workers to Dr. Frances Kelsey (left) on August 17, as Sen. Hubert Humphrey (center) watches. Dr. Kelsey denied approval for the sale in the United States of thalidomide, a sedative that caused the deformation of babies.

government agencies, aimed at insuring the safety and efficacy of drugs. (See also FOOD AND DRUG ADMINISTRATION.)

Among new drugs is one reported to give protection against migraine headaches in a large percentage of susceptible persons. Methysergide must be administered consistently, however, in order to prevent attacks.

Heart and Circulation.—Diseases of the heart and blood vessels consistently cause more deaths than any other group of diseases. Consequently it is encouraging to witness steady improvement in the treatment of some of these conditions. Unfortunately little progress was made in dealing with the greatest killer of all, coronary heart disease.

However, high blood pressure is one of the important factors contributing to deaths from circulatory diseases. Fortunately there has been steady improvement in drugs for control of blood pressure, with the recent introduction of new compounds which are more reliable and have fewer undesirable effects. An encouraging report has come from one authority in this field who found that at least some hypertensive patients, after well regulated treatment for a period of years, were able to discontinue medication without showing the usual tendency to relapse.

As complex X-ray and radioactive tracer techniques for the study of the kidneys have improved, an unexpectedly large number of cases of hypertension have been found to be due to abnormality of these organs. Restriction of blood supply (by disease or malformation of a kidney artery) or chronic disease of one kidney may produce severe hypertension. Such abnormalities may be relieved surgically in a large proportion of cases.

Arteries elsewhere in the body and the heart are being studied by the injection of radiopaque dyes and then making conventional or cine X-ray pictures. Particular attention now is being paid to the arteries supplying blood to the brain. Severe narrowing or stoppage of one of these vessels is apt to lead to a severe stroke. If a localized zone of narrowing is found in the extracranial portion of such a vessel, the obstruction usually may be relieved by surgery with consequent safeguarding of the blood supply to the brain.

Other spectacular advances in technology have achieved increasing usage during the past year. Accounts of the implantation of artificial pacemakers are carried frequently in the daily press. In such instances the mechanism which normally initiates the heart beat may be blocked or become inoperative. The artificial pacemaker supplies

rhythmic small shocks to the heart through wires which are implanted surgically. Patients have been maintained in reasonably normal activity and relieved of frequent seizures for periods of months by this method. Other types of electric shock are used to regulate the rhythm of the heart or to restart hearts which may have stopped in "cardiac arrest" under emergency conditions.

Less progress has been made in dealing with coronary artery disease, which results in decrease in blood supply to the heart muscle itself. Attempts have been made to improve the blood supply by connecting other small arteries in the chest to the coronary circulation, and an improved operation of this type was described in 1962. (See also HEART DISEASE.)

Infectious Diseases.—A notable achievement during 1962 was the demonstration that the Eaton agent, which had been regarded tentatively as a large virus, is in reality a very small bacterium, one of the pleuropneumonia-like organisms. It also was found to be the cause of a large percentage of puzzling lung infections, the so-called atypical or viral pneumonias.

Another milestone was the successful treatment of a viral infection by an antimetabolite drug of the type used in cancer therapy. The drug interferes with the formation of DNA, on which the virus is dependent for growth. The infection treated was a superficial one, but in the form of ulcers on the cornea which may cause severe loss of vision if not checked. The drug used chiefly was 5-iodo-2'desoxyuridine.

While there was continued decline in the incidence of polio to a new low in 1962, confusion arose concerning the use of oral (Sabin) vaccine for mass inoculation which had been expected to largely eliminate the disease. Oral vaccine for types I and II virus had been licensed in 1961, but approval of type III was withheld until March 1962. All three types then were used until early fall, when it appeared that the more troublesome type III vaccine had caused a few cases of infectious polio in adults. The Public Health Service then advised that this type be restricted to children and that only types I and II be given to adults. Uncertainty caused delay in some community campaigns. By December the Public Health Service had withdrawn its recommended restrictions, but pointed out a small risk for adults.

Further experience was gained with measles vaccines, both live and killed virus types. The former was used successfully in Africa, where measles is a serious disease with comparatively high mortality. Work has continued on vaccines to combat the common cold and other respiratory infections. Considerable protection from such illness in Army recruits, due to adenoviruses, was provided by a vaccine. The majority of respiratory infections are believed to be caused by syncytial virus, parainfluenza viruses, the Eaton agent, and adenoviruses. A vaccine containing all of these, and perhaps other respiratory viruses, was planned.

Miscellaneous.—Unusual uses for very low temperatures in medicine were reported. A supercold needle-like probe was used to freeze small areas deep in the brain, instead of destroying them by other means, in the treatment of Parkinson's disease. Stomach ulcers and hemorrhage from the stomach were treated successfully by circulating a refrigerated solution through a balloon placed in the stomach.

MENZIES, Robert Gordon

Prime minister of Australia: b. Jeparit, Victoria, Australia, Dec. 20, 1894.

Son of a country storekeeper, Menzies was graduated from the University of Melbourne with first-class honors in law and, in 1918, entered on a brief but brilliant legal career. He served in the Victoria legislature from 1928 to 1934 and then was elected to the federal House of Representatives, also becoming attorney general in the cabinet of Prime Minister Joseph Lyons. On Lyons' death in 1939, Menzies became premier and leader of the United Australia Party. In 1941, with his party and administration beset by disunity, he resigned. In eight years out of office during the Labour regime, he reorganized his party and renamed it the Liberal Party; and in December 1949, having formed a coalition with the farm bloc's Country Party, he was returned to office.

After the Liberal-Country Party coalition won the Australian general election by a narrow margin on Dec. 9, 1961, Prime Minister Menzies formed a new cabinet (December 22), relinquishing the portfolio of external affairs to Sir Garfield Barwick. In 1962, Menzies conferred with British Prime Minister Macmillan in London (May 30) and with President Kennedy in Washington (June 18–20), principally on the effects on Australian trade of Britain's projected entry into the European Economic Community (EEC). Menzies called for permanent safeguards of the trade of the Commonwealth nations with Great Britain, rather than the protection until 1970 which was being considered, and warned that Great Britain's ties with the Commonwealth might otherwise be weakened. Menzies and the other Commonwealth prime ministers took the same position at their annual meeting in London, September 10–19.

MERCHANT MARINE

On Sept. 1, 1962, there were 907 vessels of 1,000 gross tons and over in the active oceangoing United States merchant fleet, or 20 less than on Sept. 1, 1961. The total United States merchant fleet (including military types in reserve fleets), active and inactive, consisted of 2,877 vessels, or 41 less than a year earlier. The decrease was accounted for by a drop of 45 ships in the government-owned and an increase of 4 ships in the privately owned fleet.

MERCHANT FLEETS OF THE WORLD[1]

Country	No. ships	Dwt. tons
World total	17,426	177,290,000
United States:		
Privately owned	973	14,097,000
Government owned	1,760[2]	16,878,000
United Kingdom	2,363	25,685,000
Norway	1,360	17,342,000
Liberia	811	16,693,000
Japan	1,133	10,396,000
Greece	726	8,958,000
Italy	646	6,739,000
West Germany	873	6,393,000
France	636	6,196,000
Other countries	6,145	47,913,000

[1] Oceangoing steam and motor ships of 1,000 gross tons and over as of Dec. 31, 1961. [2] Excludes Navy-owned ships in reserve fleets of Maritime Administration.

Government Fleet.—The government fleet numbered 1,889 on Sept. 1, 1962, compared with 1,934 on Sept. 1, 1961. Most of the decrease was caused by scrapping of Liberty ships (built during World War II) from the National Defense Reserve Fleet, which dropped from 1,897 to 1,860

vessels. About 500 of this type of ship are being kept under preservation for emergency use, in addition to the 900 ships previously selected for retention for their potential national defense value.

The net loss in the government fleet of 45 ships resulted from scrapping of 57 reserve fleet ships and transfer of 2 ships to other government agencies, while 7 ships were traded in by private owners, a net of 6 ships were placed in the reserve fleet by the Navy, and the Nuclear Ship *Savannah* was accepted by the Maritime Administration from the builder for experimental operation.

Private Fleet.—The total privately owned fleet increased from 984 to 988 ships during the year. Thirteen ships were returned from foreign to United States registration and 26 new ships were delivered, while 24 ships were transferred to foreign flags, 7 were traded in to the government for credit toward new construction, and 4 were marine casualties. Two ships were exchanged for better types of government-owned reserve fleet ships.

Shipbuilding.—Large oceangoing ships under construction or conversion in United States shipyards on Sept. 1, 1962, numbered 57 vessels with a total deadweight tonnage of 873,163 and an estimated value of $564.6 million. (A year earlier, 81 ships totaling 1,336,573 deadweight tons and valued at $784.9 million were being built or converted.) Of these, 53 were new ships for private owners, comprising 10 tankers, 4 combination passenger-cargo-container ships, and 39 freighters. Three small hydrographic ships were being built for the Coast and Geodetic Survey. The remaining ship was a conversion.

During the year ending Sept. 1, 1962, 40 new ships were completed: 22 freighters, 4 tankers, 2 experimental ships—the Nuclear Ship *Savannah* and the Hydrofoil Ship *Denison*—and 12 conversions. Orders were placed for 16 ships, including 12 new freighters and 1 cargo-passenger-containership, 1 tanker, an oceanographic ship for the Coast and Geodetic Survey, and a conversion.

The long-range replacement program undertaken by United States shipping companies receiving government help, totaling 300 ships to be completed by the late 1970's, had delivered 47 ships by Sept. 1, 1962, and 43 others were under construction at that time.

Research was under way for design of an experimental surface-effect ship for the government which would ride over the surface of sea and land on a cushion of air. Many other research projects were under way to improve the operating efficiency of merchant ships.

Trade.—The 15 lines having contracts with the government to serve essential United States trade routes had a total of 315 ships in subsidized service on Sept. 1, 1962, 12 more than the number a year earlier. The government paid the difference on several principal items of operating expenses between these ships and the costs of their foreign competitors. The share of United States trade carried by United States flag ships continued to decline to 8.8% of total commercial and aid cargoes in 1961.

DONALD W. ALEXANDER,
Maritime Administrator.

MERCURY. See MINERAL PRODUCTION.
MERCURY, Project. See SPACE FLIGHT—*Manned Space Flight.*

METALLURGY

Low-density, high-elastic-modulus materials are needed for missile and spacecraft structures. Magnesium-thorium alloys with a density of 0.065 pounds per cubic inch and an elastic modulus of 6,500,000 pounds per square inch (psi.) are used. A weight saving of 20% is promised by new, lower-density magnesium-lithium alloys.

Beryllium.—Beryllium, with a density of 0.068 pounds per cubic inch and an elastic modulus of 44 million psi., would provide elastic stability at about half the weight. High cost, poor ductility, and fabrication difficulties presently limit the use of beryllium to reentry heat shields, guidance-gyroscope parts, and moderator and reflector materials for nuclear reactors.

Progress is being made in beryllium production and fabrication. Vitro Corporation of America has a pilot plant in operation for processing low-grade beryllium ores in Utah. A new concentration plant has been built by the Mineral Concentrates and Chemical Company in Colorado for treating beryl-bertrandite ore. The Brush Beryllium Company has completed a $6 million expansion increasing the output of its Elmore, Ohio, plant to 30,000 pounds of beryllium per month. Brush also has a new $3 million mill at Cleveland, Ohio, which will double its fabrication capacity, and, it is expected, reduce the price of finished beryllium products.

Beryllium oxide, beryllia, has been produced recently in high-density form. Its unusually high thermal conductivity and strength at high temperatures make it useful in ceramics.

Light, intermetallic compounds with beryllium, known as beryllides, are attracting attention for high-temperature structural use. They are lighter and more resistant to high-temperature oxidation than existing materials. The top-use temperature is said to be 50% higher than cobalt-, nickel-, and columbium-base superalloys.

Columbium.—Recent progress has been made in the production of columbium (niobium) metal and in the development of columbium-base alloys for strength in the 2500°F. temperature range and of columbium alloys for superconductivity.

With a large electron-beam furnace, Temescal Metallurgical Corporation produces columbium ingots directly from semipurified oxide. This new process produces nuclear-grade columbium ingot at $15 a pound and structural-grade alloy ingot at $12 a pound. Temescal estimates that by 1970 a production rate of 800 tons per month will be reached and a price of $4 a pound achieved.

Haynes Stellite Company has announced a new high-strength columbium alloy, Cb-752, containing 10% tungsten and 5% zirconium. It can be fabricated by conventional methods and has a tensile strength of 25,000 psi. at 2400°F. Two other new columbium-base alloys for high-temperature service have been developed and are commercially available from du Pont. They are D-14, an alloy with zirconium, and D-36, an alloy containing titanium and zirconium.

Superconducting materials are needed to produce magnetic fields of high intensity for plasma devices to produce electrical power directly from heat and to compress plasma for controlled thermonuclear-fusion experiments. A columbium-tin compound, Cb_3Sn, has proved a good superconducting material, and Bell Telephone Laboratories has developed a suitable wire by cold drawing and heat-treating a composite of mixed columbium and tin powder in a columbium metal sheath. Superconductivity at an average current density of 150,000 amperes per square centimeter in magnetic fields as strong as 88,000 gauss has been obtained with this wire. Radio Corporation of America, by another method, produces the columbium-tin alloy as a thin coating on fine wire. The Wah Chang Corporation has drawn wires less than

0.01 inch in diameter from zirconium alloys containing 25% columbium. These are said to maintain superconductivity in fields up to 80,000 gauss at current densities of 10,000 amperes per square centimeter.

METEOROLOGY AND CLIMATOLOGY

The seasons from autumn 1961 through summer 1962 brought their usual wide variety of weather.

Autumn 1961.—Very cool weather in the lower Great Plains and Far West brought temperature deficits up to 4°F. In contrast, it was 1–4°F. above the average east of the Mississippi. A noteworthy hot spell occurred in the Northeast in the first 10 days of September, which brought to many places their highest temperatures of the year. In October, southern California had a heat wave which brought record-breaking late-season temperatures to San Diego (107°F.). November was very warm in the East.

Rainfall was above normal in the Rocky Mountains and midcontinent regions, but the Southeast had less than 50% of the average. A heavy belt of rain from Texas to Michigan was caused by hurricane Carla, which killed 46 and injured 500 persons and left property and crop damages in excess of $300 million.

In October, 700 lives were lost in floods in Bihar State, India. November brought flooding in the Ukambani and Tana rivers of Kenya, with disruption of communications. Rains in Uganda raised the level of Lake Victoria to the highest stage since 1917, and the Congo also experienced the worst rains in 50 years.

Winter 1961–62.—Winter temperatures were generally below average over most of the United States. Exceptions were the southernmost districts along the Mexican border and the Gulf coast, where February had excesses above 6°F. Parts of the state of Washington were very warm. The greatest cold centered from northwestern Oklahoma to Lake Superior, with a deficiency of 6°F. in central Iowa. In most other areas, temperatures 2 to 4°F. lower than average were experienced.

Precipitation was particularly heavy in the northern Great Plains, the lower Mississippi Valley, the southern Appalachian region, and southern California where excesses of 50% above average were noted.

In the middle of January, central Australia's 6-year drought was broken by 6 inches of rain north of Alice Spring. On February 17 the worst storm since February 1825 hit the coast of the Netherlands and northwestern Germany, killing 322 persons and leaving about 100,000 homeless. In December a 2-week cold spell caused death by freezing to 600 persons in the Ganges Plains of northern India.

Spring 1962.—April over the United States was a relatively cool month, succeeded by a very warm May with summerly heat in most parts of the nation east of the Rocky Mountains. This compensated for the earlier cool weather and resulted in close to average temperatures everywhere for the season as a whole, with few departures exceeding 2°F.

Precipitation was close to average, except in the northern Great Plains, where up to twice the average amounts were received. This definitely ended the drought conditions in the Dakotas and northern Mountain states. February and March rains also ended a 3-year drought in California, while unprecedented snowfall in Nevada improved water supplies well above the low 1961 levels.

The most spectacular weather event during the season was a late winter storm along the Atlantic seaboard between March 5 and 9. It brought heavy snowfalls from Virginia to New England. Worst damages resulted, however, from the gale-driven storm surge along the coast. Gales with gusts up to 85 miles per hour piled water on 7- to 10-feet-high spring tides, resulting in waves of up to 30 feet high. Thirty-three persons were killed, mostly by drowning, and 1,250 were injured; about 1,800 dwellings were destroyed and 17,000 were damaged. Total damages were estimated at $300 million.

Spring droughts threatened crops in China, Korea, the Philippines, and northeastern Brazil. Drought also struck Lebanon and South Africa. At the same time floods ravaged areas in Cuba, Dahomey, Poland, Iran, and Uzbekistan.

Summer 1962.—In most parts of the United States, especially the East, the summer was cool. In July the northern Great Plains and New England were as much as 2° to 4°F. below average. Only the Gulf coast states had slightly above-average temperatures. Rainfall was near or above average in central and eastern Texas, the Gulf coast, and in the Plains states. Deficiencies were marked in Louisiana and genuine drought developed in some parts of Pennsylvania, New York, New Jersey, and Maryland.

June floods caused serious damage to crops in southern China, and torrential rains in July caused devastation in the Canton area. Downpours from Kyushu to central Japan, where 8 to 10 inches of rain fell the night of July 3–4, killed 19, flooded out 56,800 persons, and caused great damage to roads. Excessive monsoon rains in the Philippines during the middle of July left 360,000 persons homeless. Taiwan was particularly hard hit by typhoon Nora early in August, with 80 persons killed, 1,400 injured, and thousands made homeless.

Storm Statistics.—Complete United States statistics for 1961 showed a total of 682 tornadoes on 169 days, causing 51 deaths and 917 injuries. Other windstorms caused 64 deaths. There were 10 tropical storms in the North Atlantic and Caribbean. Eight of these reached hurricane intensity, causing 299 fatal casualties (46 in the United States). The remarkable thing about the hurricane season was the complete absence of tropical storm activity in July and August; however, there were only three storm-free days in September. On September 11, four hurricanes were in existence simultaneously, the first such occurrence on record.

In the North Pacific there were 41 tropical cy-

clones in 1961, 11 more than the annual average. Of these storms, 23 reached typhoon intensity.

Hurricane Studies.—Television pictures from satellites and reconnaissance flights into the eyes of hurricanes have given a completely new understanding of these storms. The Tiros III satellite alone spotted 50 tropical cyclones in all stages of development. The emerging new model of the hurricane shows that a single major updraft cell in the front right sector of the wall of the eye of the storm is the primary seat of energy conversions. In a typical hurricane, updrafts of 2,100 feet per minute were observed to heights of over 50,000 feet in this cell. Behind it, downdrafts of the same magnitude prevailed. The water within the cloud cell is severely undercooled. Observations of liquid water at −60°C. have been reported. Above this "energizer" cell there is outflow of air which results in a wide cirrus cloud shield.

The subcooled water of the eye wall was the target of a cloud-seeding study of hurricane Esther in 1961. This hurricane had a circular eye 15 to 20 miles in diameter. The experiment involved a single, almost instantaneous, injection of silver iodide in the cloud cell. Seeding took place in cloud tops near the point of maximum wind from 4 miles inside the cloud wall surrounding the eye to 8 miles into the rainy shield. After seeding, radar spotted rapid transition. The water in the northern eye wall froze rapidly. It is estimated that 400 cubic miles of cloud were converted from water to ice in about 40 minutes. This is equivalent of an energy release of heat of fusion of 200 million kw.-hr., or the yield of 8 atomic bombs with 20 kilotons energy release. However, it still represents one tenth of 1% of the total energy released by the hurricane in the same time span. An evaluation of the experiment showed that there was, as had been assumed before, a temporary reduction of 10% in maximum wind speeds, due to an outward diffusion of energy.

The fine-scale structure of the spiral rain bands of tropical storms has also been revealed. These bands, which bring the major amounts of rain, have a zone of low pressure along their front edge. The surface winds converge into this zone, and divergence of air flow takes place to the rear of the bands.

The new findings also throw a light on hurricane formation, which seems to be due to dynamic instability in the air. The sequence appears to be that areas of low-level unorganized convection in easterly waves drift under high-level anticyclonic systems at the 50,000-foot level. These help in outflow of mass over the top of the lower disturbance, causing at the surface a low pressure system which is then maintained by the heat of condensation of water vapor.

Satellite Meteorology.—Three additional Tiros weather satellites were launched during the year. The useful lifetime of Tiros IV extended from February 8 to June 12. In that interval the satellite obtained 836 useful cloud pattern pictures on which 102 storm advisories were based. Tiros V was launched on June 19 to help in the discovery of tropical storms. Its orbit, inclined 58° to the equator, enabled it to obtain cloud pictures from latitudes 65°N. to 65°S. Tiros VI was launched on September 18.

In its pursuit of a space policy devoted to peaceful purposes, the United States started to share Tiros cloud pictures with other countries by radio facsimile. This system started on April 15, 1962, with broadcasts beamed to Europe, South America, Africa, the Far East, and the Southwest Pacific.

The first results of infrared radiation measurements from satellites have become available. Small radiometers composed of black and white thermistors, weighing only a few ounces, receive the dark radiation coming from the earth. The intensity of this radiation is governed by the temperature of the radiating surface. The instruments differentiate primarily between the earth's surface and high upper-cloud surfaces. Cloud covers determine the radiation pattern. Inasmuch as cloud covers of variable vertical development are caused by low-pressure centers and fronts, the radiation pictures indicate these weather features and their motion. The highest radiation readings are found over high pressure systems, where clear sky prevails. Oceans and cloudless vegetated land areas reflect 7% of the incoming radiation; cloud surfaces, 55%; and deserts, 25%.

A special infrared spectrometer has been designed for use in future meteorological satellites. This will measure the outgoing terrestrial radiation in four narrow spectral intervals in the 15-micron carbon dioxide band and will make it possible to infer the mean temperatures of four atmospheric layers above 25,000 feet with an accuracy of 1°C. (See also Space Flight.)

NEWSDAY

At Fire Island, N.Y., barge pumps landfill to repair damage caused by a storm that hit the east coast on March 7.

Cloud Physics.—A new Air Force dispenser permits production of carbon dioxide snow directly from liquid carbon dioxide carried in aircraft. This enables pilots to create holes in supercooled stratus cloud decks when and where required. Another device has been developed which electronically counts and optically measures raindrops. It can automatically handle up to 10,000 drops per minute in each of 13 size classes. It will permit the gathering of better basic data on natural rain formation, ranging from drizzle to cloud bursts.

Continuous measurements of freezing nuclei have shown extreme, and often very rapid, variations in the atmosphere. Changes by several hundred percent in a few hours are not uncommon. Nuclei active at −20 to −30°C. vary from a few to hundreds of thousands per liter.

Hotel swimming pools at Miami Beach, Fla., are inundated by high waves resulting from an Atlantic storm, in March.

WIDE WORLD

Considerable new attention has been paid to lightning processes and their relation to precipitation. New spectral photographs of lightning showed bands of atomic and molecular nitrogen as most prominent features. They also gave evidence of the presence of cyanide. Temperatures within the strokes were estimated at 6,000 to 30,000°K. High-speed photographs also showed in some strokes steady luminosity lasting one fifth of a second. Such a relatively long flow of electricity from cloud to earth can contribute materially to the earth's negative charge. These continuing currents bring charges of about 135 coulombs to earth with a current intensity of 80 amperes.

The old observation of increased rates of rainfall after lightning discharges in thunderstorms has been checked and verified with radar. In the cloud space 2 to 3 miles upward, radar-reflecting droplets form a few seconds after lightning, and 30 to 60 seconds later heavy rain starts at the surface. The evidence points toward a coalescence of the droplets initiated by the electrical phenomena connected with lightning.

A field experiment in Illinois attempted to test the hypothesis that high electric space charges introduced into clouds might enhance precipitation. Energized wires 8½ miles long were charged to a high potential in an area with a dense network of rain gages. Radar observations of clouds also were available. In nine summer storms no changes significantly different from what would have been expected naturally took place.

An evaluation of three seasons of anti-lightning operations in the forests of California by use of ground-based silver iodide dispensers showed neither significant reduction in lightning nor any appreciable increase in rainfall. The number of available freezing nuclei was, however, materially enhanced. The work suggested that seeding from airborne generators might have been more effective.

Upper Atmosphere.—There is good evidence that helium ions are an important constituent of the upper atmosphere above 800 miles. The helium-rich layer is estimated to be 1,200 miles thick; above it, protons prevail.

Atmospheric pressure waves with periods from 20 to 80 seconds and amplitudes of 1 to 8 dynes per square centimeter have been associated with high geomagnetic activity. They are noted several hours after the onset of strong geomagnetic disturbances created by solar corpuscular rays. Their origin is sought in the levels above 60 miles.

A complete new model of atmospheric ozone circulation has been developed. This shows that near the equator the major amounts of ozone are concentrated above 14 miles, whereas in high latitudes the ozone concentration rises rapidly above 6 miles. The differences between high and low latitudes are most pronounced in winter and spring. An ozone transport from lower to higher latitudes takes place above 12 miles. It moves through gaps in the tropopause associated with jet streams into the lower layers, and even to the surface. There the ozone is destroyed by contact with other substances. (See also ATMOSPHERE RESEARCH.)

Numerical Weather Prediction.—The practical operational forecasts of atmospheric flow are now based on a 3-level baroclinic model. Initial data and predicted winds and pressure contours are for the 850-millibar level (about 5,000 ft.), 500-millibar level (about 18,000 ft.), and 200-millibar level (about 35,000 ft.). The model is based on a nongeostrophic vorticity equation, carrying both rotational and irrotational components of the wind. It includes both surface friction and mountain effects. Vertical motions are included in the prediction. Upward motions indicate areas of cloud development and rainfall.

Radar observations are now being digitized and will soon be amenable to incorporation into local prediction schemes using automatic data-processing equipment. Radar echoes of squall lines and of single intense storms which move on a collision course often permit the prediction of tornado development at the point of intersection.

New Observational Techniques.—A new electric hygrometer for radiosondes has been designed. It consists of a thin film of barium fluoride, which has a very rapid response to environmental humidity changes. This substance is much superior to the conventional lithium chloride element.

A useful technique has been demonstrated for measurements of higher atmospheric winds. A solid-propellant sounding rocket produces a smoke trail combination of titanium tetrachloride with atmospheric water vapor. The drift of the highly persistent smoke can be observed with theodolites or photographed for ready calculations of wind speeds and directions. This gives the actual instantaneous motions in the various layers and eliminates the averaging through the layer performed by the usual pilot-balloon procedure.

An automatic isotope-powered weather station installed on Sherwood Head, on Axel Heiberg Island, 750 miles from the North Pole, has operated very satisfactorily for a year. It can report temperatures from −60 to +50°C., pressures from 950 to 1,080 millibars, wind speeds to 150 knots, and wind directions to the nearest 10 degrees. Its 250-watt output sender is put on the air by a precision chronometer every three hours. The signals are clearly received at the manned station at Resolute Bay, 250 miles to the southwest. A similar unit with a 10-watt generator has been placed in operation near Minna Bluff, 54 miles south of McMurdo Sound in the Antarctic.

H. E. LANDSBERG,
Director, Office of Climatology, United States Weather Bureau.

METHODIST CHURCH

Total membership of Methodist churches throughout the world was officially announced as 19.5 million in 1962. The number of Methodist adherents was estimated at 42.5 million. These figures included the various branches of Methodism. In the United States, the denomination known as The Methodist Church reported a membership of 10,153,003 in nearly 40,000 churches. Fourteen of the churches had more than 5,000 members each, but the average Methodist church in the United States had about 250 members.

The Board of Missions of The Methodist Church announced early in 1962 record disbursements during its past fiscal year for mission work in the United States and 44 countries overseas. Expenditures totaled $33,785,000. This was $3,667,000 more than the previous year. The Methodist Church was reported as being vigorously alive in Cuba and still alive and growing in Estonia (now a part of the Soviet Union).

In New York City, a site was being cleared for a Church Peace Center for the United Nations, to be erected by The Methodist Church. The 12-story structure was expected to be occupied in 1963 by Methodist and other offices related to the cause of world peace or the United Nations.

Further steps were taken toward the development of a Methodist center in Washington, D.C., to house national Methodist agencies and other offices. In Evanston, Ill., a new Methodist building housing five national Methodist agencies and other offices was consecrated. The five agencies formerly had their headquarters in Chicago.

Methodist representatives participated in a consultation on church union and had "unity conversations" with representatives of three other Protestant denominations—Protestant Episcopal Church, United Presbyterian Church in the U.S.A., and United Church of Christ. The Methodist Church and the Evangelical United Brethren Church also discussed a possible merger.

Officers of the Council of Bishops of The Methodist Church are Bishop Marshall Reed, Detroit, Mich., president; Bishop Paul N. Garber, Richmond, Va., president-designate (to take office in April, 1963); and Bishop Roy H. Short, Nashville, Tenn., secretary.

The denomination's first television series for children, *Breakthru*, went on the air in 1962, and a second series was begun.

In a year of increasing perplexity concerning church-state relations, the first Methodist-sponsored national institute on church-state relations was held in Washington, D.C.

WILLIAM M. HEARN,
Associate Secretary, Commission on Public Relations and Methodist Information of The Methodist Church.

METROPOLITAN AND REGIONAL PLANNING. See CITY PLANNING; HOUSING.

MEXICO

The third largest republic of Latin America (area, 760,335 square miles), Mexico extends south from the United States to the borders of Guatemala and British Honduras.

Population.—Mexico's population (1960 census) of 34,625,903 is growing at one of the fastest rates in the world (3.4%). Although more than half the population resides in rural areas, the proportion is declining. The largest cities (1960 census) are Mexico City, the national capital, which is located in the Federal District (4,636,075); Guadalajara (703,866); and Monterrey (615,009). Considerably more than half the population is of mixed European-Indian descent; most of the remainder is Indian. Spanish, the official language, is spoken by more than 90% of the population. Persons speaking only Indian languages number fewer than 800,000; a much larger number of persons speak both Spanish and an Indian tongue.

Government.—Although Mexico is a federal republic (29 states, 2 national territories, and a Federal District), the central government exercises much more authority than its counterpart in the United States. President Alfonso López Mateos was elected to a 6-year term beginning Dec. 1, 1958; he cannot be re-elected. The legislature consists of a Senate of 60 members, and a Chamber of Deputies with 178 deputies. The government has been dominated for many years by the Institutional Revolutionary Party (PRI), which is essentially moderate in its policies. All but 6 of the national deputies are members of the PRI. The president appoints the Supreme Court of 21 members for life tenure. The states have elective governors and legislatures; most of these officials are members of the PRI.

Education and Religion.—More than half the population is illiterate, and the rapid growth of population makes it difficult to improve the literacy rate. Of the total 1962 federal budget, the largest allocation—$196 million, or 20% of total expenditure—was for education. The budget provided funds to print 22 million primary textbooks for free distribution (see also below, *Events, 1962*). In 1960 about 40% of the school-age children could not attend school because of the lack of facilities. An estimated 5,583,000 pupils were enrolled in primary schools in 1962. In 1960, 207,732 students attended 693 secondary and vocational schools, and an estimated 30,000 students were enrolled in 79 teacher-training schools. University enrollment at 18 institutions in 1958 was 123,254. Roman Catholicism is the dominant church affiliation.

Finance.—In recent years the government's fiscal position has been strong as the result of a near balance between revenues and expenditures, close control of credit and inflation, and a sound balance of payments situation. Foreign exchange reserves totaled $390.3 million at the end of 1961, or $20 million less than at the end of 1960. Mexico's foreign debt at the end of 1961 stood at $818.7 million (up 23.4% from a year earlier); $115.1 million was paid on the principal and interest of foreign obligations in 1961. Foreign credits totaled about $250 million in 1961 (down $37 million from 1960).

The 1962 federal budget totaled 12,319 million pesos, up 11% from the 1961 budget (12.5 pesos equal U.S.$1). Allocations for 1962 included 39% of total expenditure for economic development, 35% for investment and social services (including education), and 10% for the armed forces. Income taxes were the largest single source of revenue, accounting for 34% of total revenues (compared with 32% in 1961). Authorized investment in the public sector increased to 10.523 billion pesos in 1961 (up 20% from 1960). The two largest investors in the public sector are the government petroleum monopoly, PEMEX, and the Federal Electricity Commission.

Transportation and Communications.—The transportation and communications systems have been much improved and expanded in recent years by governmental actions. The 16,000-mile railway system is a state enterprise. In 1961 the government opened a new railway on the Pacific coast. In 1960 there were 17,940 miles of paved roads, and 10,666 of surfaced roads. The World Bank in 1962 loaned Mexico $30 million for road-building programs. There are 8 Mexican national airlines, 3 of which fly international routes. The government took control of Guest Aerovias de Mexico, the country's third largest airline, on Aug. 1, 1962. In 1960 there were some 545,000 telephones, 4 million radio receivers, and 600,000 television sets.

Economic Conditions.—Since about 1940 the Mexican economic growth rate has been high. Growth has been fastest in industry, but quite rapid in agriculture; mining output has lagged. The annual economic growth rate in real terms averaged 7.5% in the 1940's, and 5.0% in the 1950's. The rate of growth, which was 4.6% in 1959 and 5.7% in 1960, declined drastically to 3.5% in 1961, when the gross national product was estimated at 139.1 billion pesos ($11,128 million). The economy was relatively dormant in 1961; per capita income failed to increase because of the high population growth, and prices remained stable.

Economic growth is closely controlled by the government, and is aided by large public investments. Authorized public investment rose to 10.523 billion pesos in 1961, from 8.73 billion in 1960. In 1961, private investment declined, and total Mexican borrowing abroad decreased in 1961 to $249.9 million, or about $37 million less than in 1960.

Agriculture.—Mexico is virtually self-sufficient in agricultural products, and has a valuable export traffic. About 50% of the economically active population is engaged in agriculture. Agricultural growth was only 3% in 1961, and practically negligible in 1960. In 1961, agricultural and grazing operations accounted for 20.4% of the gross national product, and was valued at $2.27 billion.

WIDE WORLD

Arriving in Mexico for two-day visit, President Kennedy (waving) is shown with President López Mateos being welcomed by an enthusiastic crowd in Mexico City on June 29.

In 1961 about 50% of the cultivated land was allotted to corn production, which totaled about 5.5 million tons (500,000 tons more than in 1960, but 63,000 below the 1959 record), and covered domestic requirements. The bean crop in the 1961–62 crop year was estimated at a record 620,000 tons, which was sufficient for domestic needs. Coffee production in 1961 was 2.1 million sacks (about 132 pounds each). Cotton production in the 1961–62 crop year was some 1.8 million bales (down 10% from 1960–61).

Industry.—In 1961, manufactures accounted for 25.6% (or $2,848 million) of the gross national product. Growth was at a low rate in consumer goods (up 3.5%) and construction (up 1%), but continued at high levels in petroleum (up 15%) and electric power (up 10%), the last two being government monopolies. Chemical production was up 12%. The key iron and steel industry continued to grow; steel ingot production increased to 1,682,000 tons (up 9.3% over 1960).

Mining and Petroleum.—Although mining employs few persons and accounted in 1961 for only 2.5% (or $278 million) of the gross national product, it contributes heavily to exports. In recent years production has stagnated because of low world prices and legislation requiring largely Mexican ownership of mining properties, the effect being to decrease foreign investment in mining. Mineral output by volume was 1.4% higher than in 1960, and metallic mineral production was up 11.8%, largely because of the greater output of iron ore for the steel industry. Production was down for most metallic minerals, which were leading exports. Chief minerals (metric tons, 1961): coal, 1,044,000; iron ore, 687,600; lead, 178,800; zinc (primary), 51,840; and gold, 269,000 ounces.

The petroleum industry grew rapidly again in 1961. Production of crude, distillate, and natural gas liquids increased 8.05 million barrels in 1961; output averaged 320,070 barrels per day (297,190 per day in 1960). Refined oil production in 1961 was 119.9 million barrels, up 11.7 million from 1960. Total operating receipts of PEMEX in 1961 were 6,479 million pesos (up 11.9%), of which domestic sales accounted for 6,004 million.

Foreign Trade.—Exports of agricultural products have grown in recent years; industrial exports have also increased; but mineral exports have lagged. The large imbalance between Mexico's commodity exports and imports is well compensated for by other factors, particularly the large income from foreign tourists and remittances by Mexican workers in the United States. Most imports are production goods, reflecting the government's policy of building industry, and the existence of a consumer goods plant able to supply the national market.

In 1961, exports of goods and services totaled $1.61 billion (of which $802 million was merchandise exports), and imports of goods and services were $1.679 billion. Net return from tourism in 1961 was $386 million ($373 million in 1960). Agricultural and stock exports accounted for 55% of 1961 merchandise exports, and mining contributed 25.5%. Principal exports and 1961 values: cotton, $159.5 million; coffee, $74.6 million; sugar, $68.8 million; and petroleum, $34.7 million. The United States took 57% of Mexican export value in 1961, and supplied 68% of total import value.

Events, 1962.—Conservatives charged that the slowdown in economic growth and the flight of capital were due to government policies damaging to business confidence, including particularly an alleged tendency toward socialization of the economy. The government, in turn, attempted to make further private investment in the country a matter

of patriotic duty. It also devoted much effort to assuring the business community that the latter would retain a permanent and important role in the economy. In July the government announced a list of 500 fields in which it hoped that private enterprise would expand its activities.

The government's conservative opposition continued to charge it with radicalism and dictatorship, and criticized Mexico's noninterventionist stand on Cuba at the meeting of American foreign ministers in January. A quarrel developed between conservatives and the government over a federal program for the compulsory distribution of free school books. Conservatives declared that the books were socialistic and anti-Catholic; the government said that the conservative critics lacked concern for education of the poor, and that they were motivated by economic and political aims. Demonstrations against the textbooks centered in Monterrey. Conservatives were even more unhappy with leftist parties than with the ruling PRI. The Cuban crisis in October brought new demands from the conservative National Action Party (PAN) for government action against Castro.

Ex-president Lázaro Cárdenas remained the government's most prominent leftist critic, even though his position was more ambiguous than usual. As a member of the pro-Castro National Liberation Movement (MLN), he supported more "revolution" for Mexico. On the other hand, Cárdenas held a government position as director of an irrigation project, and in August he praised the social and economic efforts of the administration, but criticized the Roman Catholic Church and private business. In November there were rumors that Cárdenas had left the MLN, but rightists expressed doubts. Rightists also denounced as a Communist maneuver the break with the MLN announced in June by V. Lombardo Toledano, head of the Popular Socialist Party and longtime advocate of Communist policies. Leftist criticism of Lombardo suggested, however, that his position in leftist ranks was weakening.

Opposition to the government also was expressed by persons who staged "hunger marches" on the capital; they were chiefly peasants ostensibly protesting abuses of the agrarian reform program. There also were incidents involving squatters who attempted to seize land. It seemed likely that in many cases both marchers and squatters were in part stimulated by political agitators.

The government and the PRI defended themselves in various ways against leftist charges of "rightism" and insensitivity to the needs of the poor. The refusal to take strong action against Castro was part of this defense; also important was the constant attention paid to social and economic development. President López Mateos stated in his message to Congress in September that in the past 12 months he had distributed 3.37 million hectares (the hectare equals 2.47 acres) through the government's land-reform program, and that total federal distribution during his administration was 10.043 million hectares. (An additional half-million hectares were distributed by the states.) Congress on September 12 completed action on a constitutional amendment granting the government authority to force any company to share its profits with employees. The government continued its efforts to ensure supplies of low-cost food and clothing, partly through the National Company for Popular Subsistence.

The National Border Program for the rehabilitation of nine Mexican cities on the United States border was accelerated in 1962. Construction of a highway, a park, and an area for public buildings in Ciudad Juarez was finished in April, marking completion of the first phase of the program. A three-year plan for economic development was announced by the government in May.

The Mexican people enthusiastically welcomed President and Mrs. Kennedy during their visit to Mexico City from June 29 to July 1. Following his talks with President López Mateos on inter-American affairs and common economic matters, a joint communiqué disclosed that the United States would move to lessen the damage that saline waters from the Colorado River was causing to Mexican agricultural land.

Earthquakes occurred in the Mexico City and Acapulco areas in May. At least three persons were killed, and there was extensive property damage.

MICHIGAN

A North Central state of the United States, Michigan ranks 23d among the states in area (land, 57,019 square miles; inland water, 1,197) and 7th in population (7,991,000 on July 1, 1962, a 2.1% increase from the 1960 census figure of 7,823,194). Urban places with populations above 25,000 in 1960:

Allen Park	37,494	Lansing (*capital*)	107,807
Ann Arbor	67,340	Lincoln Park	53,933
Battle Creek	44,169	Livonia	66,702
Bay City	53,604	Madison Heights	33,343
Birmingham	25,525	Midland	27,779
Dearborn	112,007	Muskegon	46,485
Detroit	1,670,144	Oak Park	36,632
East Detroit	45,756	Pontiac	82,233
East Lansing	30,198	Port Huron	36,084
Ferndale	31,347	Roseville	50,195
Flint	196,940	Royal Oak	80,612
Garden City	38,017	Saginaw	98,265
Grand Rapids	177,313	St. Clair Shores	76,657

Inkster	39,097	Wyandotte	43,519
Jackson	50,720	Wyoming	45,829
Kalamazoo	82,089		

Government.—Chief executive and judicial officers in 1962 included John B. Swainson (Democrat), governor, serving a two-year term; T. John Lesinski, lieutenant governor; James M. Hare, secretary of state; Sanford A. Brown, treasurer; Billie S. Farnum, auditor general; Frank J. Kelley, attorney general; Lynn M. Bartlett, superintendent of public instruction; and Leland W. Carr, chief justice of the 8-member Supreme Court.

The Michigan Legislature, which convenes annually, comprised 23 Republicans and 10 Democrats (with 1 vacancy) in the Senate in 1962, and 56 Republicans and 53 Democrats (with 1 vacancy) in the House of Representatives.

Legislation, 1962.—The 1962 session was marked by a continuation of the struggle between the Democratic governor and the Republican-controlled Legislature. The principal achievement was a compromise agreement on a tax program. New "nuisance taxes" increased levies on beer, cigarettes, and liquor; the corporation franchise tax was increased; and a use tax was placed on telephones, telegraph, and leased wires. One of the principal reasons for raising new state revenue was to provide increased state aid to schools, but a rider on one bill raised the pay of legislators by $2,000 annually.

As in the past, numerous measures approved by the Legislature were vetoed by the governor. Two bills providing for a 19th Congressional District, granted as a result of the 1960 census, met this fate, making it necessary to elect a congressman-at-large.

The Legislature did not adjourn at the close of its deliberations in midsummer as had been customary in other years, but recessed on June 28 and again on July 26 until December 27. By recessing instead of adjourning the senators and representatives could call themselves back into session for any emergency that might develop. This was done because the U.S. Supreme Court had taken no action on a suit seeking reapportionment of state senatorial districts. By this strategy, the Republican legislators could block any move by the governor to call

them back into special session for the purpose of redistricting the Senate. (See also below, *Events, 1962.*)

Toward the year's end it was feared that a quorum could not be secured during the holidays and that therefore the effective date of 162 bills which can not become law until 90 days after official adjournment would be delayed. Among the most controversial of these was legislation dealing with the Sunday closing of retail stores. However, both houses met as scheduled and adjourned.

Finance.—In the 1962 fiscal year, revenue of $1,228,346,845 included $980,462,974 from state taxes and $146,576,902 in federal funds. Chief tax yields were the 4% general sales tax ($426,308,466) and taxes on corporate incomes ($60,331,084) and motor fuels ($152,630,517). Spending of $1,243,830,930 included $491,949,382 for education, $343,877,807 for health, welfare, safety, defense, and adult correction, and $232,130,634 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 36,918 teachers enrolled 1,055,186 pupils; junior and senior high schools with 26,353 teachers enrolled 621,210; and private and parochial schools with 8,353 teachers enrolled 314,770. College enrollment totaled 177,045 in 92 institutions, including 16 junior colleges and 76 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $922,401,000, including current expenditures of $699,078,000 ($440.13 per pupil) and capital outlays of $175,240,000. Revenue of $1,114,569,000 was drawn chiefly from state funds ($355,709,000) and local districts (461,230,000). Teachers' salaries averaged $6,162 (high school, $6,300; elementary, $6,065). Actual spending for higher education (1961 fiscal year) amounted to $231,537,000.

Public Assistance.—In the 1962 fiscal year, public assistance to a monthly average of 324,251 persons totaled $169,053,043. This amount included $69,504,546 to the aged (including medical payments) and $53,817,935 for dependent children.

Transportation and Communications.—A total of 479 miles of highway construction and reconstruction was completed in the 1962 fiscal year; *highways and roads* on Jan. 1, 1962, totaled 111,209 miles (90,581 surfaced). These served 3,616,816 *motor vehicles* (as registered on June 30, 1962), including 2,846,028 automobiles. Operating in the state were (1961) 28 *railroads* (using 6,593 line miles of track); (1962) 11 regularly scheduled *airlines;* and 85 commercial and municipal *airports.*

Communications media included (1962) 108 AM and 36 FM *radio stations;* 1 UHF and 16 VHF *television stations;* 54 daily *newspapers* (circulation, 2,346,730) and 292 other newspapers; and (January 1) 853,300 business and 2,530,500 residential *telephones.*

Labor Force.—The state's labor force in July 1962 included 169,000 agricultural workers. Nonagricultural employment totaled 2,551,300, compared with 2,519,900 a year earlier and an average of 2,514,300 for 1961. Of nonfarm employees, 36% were in manufacturing, 16.3% in trade, and 13% in government services. Unemployment in July 1962 had dropped to 177,000 from 297,000 a year earlier.

Manufacturing.—Manufacturing engaged 964,043 workers in 1960, including 691,109 in production, and provided a payroll of $6,086,853,000. Adjusted value added by manufacture amounted to $10,864,688,000.

LEADING MICHIGAN MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Transportation equipment	289,563	$1,927,288	$3,945,457
Nonelectrical machinery	130,032	869,043	1,458,986
Primary metals	80,505	526,052	999,258
Fabricated metals	86,012	506,670	838,154
Food and kindred products	58,394	306,429	712,516
Chemicals and products	35,135	234,612	676,656
Electrical machinery	32,644	182,227	355,453
Paper and allied products	28,553	167,501	331,350
Printing and publishing	28,934	172,726	294,798
Stone, clay, glass products	18,265	102,207	221,430

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Michigan ranked 12th among the states in the value of its mineral output, with 2.44% of the national total. It was first in output of bromine, calcium-magnesium chloride, magnesium compounds, and peat; second in gypsum, iodine, iron ore, lime, and sand and gravel; and third in manganiferous ore.

MICHIGAN MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Cement:		
Portland (376 lb. bbl.)	21,948,000	$ 75,172,000
Masonry (280 lb. bbl.)	1,515,000	4,467,000
Clays	1,817,000	1,975,000
Coke	2,958,342	51,460,000[1]
Copper (recoverable content of ores)	70,245	42,147,000
Gypsum	1,295,000	5,095,000
Iron ore, usable (long tons)	9,384,000	87,604,000
Lime	1,211,000	15,960,000
Natural gas (1,000 cu. ft.)	27,697,000	5,844,000
Peat	209,266	2,002,000
Petroleum (1,000 bbl.)	18,898[2]	55,182,000[2]
Salt, common	3,885,000	31,284,000
Sand and gravel	54,603,000	47,790,000
Stone	28,731,000	30,103,000
Other minerals	...	46,186,000
Total	...	$442,696,000[1,3]

[1] Value for processed materials is not included in total. [2] Preliminary. [3] Total adjusted to eliminate duplication of value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $540,704,000, compared with $522,881,000 for the corresponding period of 1961. For the full year 1961, income comprised $394,273,000 from livestock, $339,674,000 from crops, and $37,178,000 in government payments. Principal income sources in 1961 were wholesale milk, $202,922,000; cattle, $85,144,000; and wheat, $59,893,000.

The state's 112,000 farms in 1959 had an acreage of 14,783,000 (7,155,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,752,000 cattle, 747,000 hogs, and 7,196,000 chickens. An average of 175,000 family and 42,000 hired workers engaged in farming in 1961.

MICHIGAN CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	10,520	16,000	12,000
Beans, dry edible (1,000 bags)	4,586	7,358	7,527
Cherries (tons)	81,100	103,500	138,000
Corn for grain (1,000 bu.)	76,879	101,864	91,520
Maple sirup (1,000 gal.)	83	82	73
Potatoes (1,000 cwt.)	7,077	9,116	8,585
Soybeans (1,000 bu.)	3,876	7,410	7,898
Sugar beets (1,000 short tons)	832	1,178	1,077
Wheat (1,000 bu.)	33,969	39,996	29,965

Events, 1962.—The financial crisis which had plagued the state government for six years eased somewhat in 1962. Late in the year there were in-

Republican George W. Romney and his wife (right) hail his victory in Michigan's gubernatorial election, November 6.

UPI

dications that tax revenues would be some $30 million more than had been expected and that the state deficit could be reduced from $85 million to about $55 million. The increase in revenue resulted in part from larger sales tax collections and from income derived from newly passed "nuisance" taxes (see above, *Legislation, 1962*).

Increased spending was partly accounted for by the fact that unemployment in mid-September had dropped to its lowest point in seven years. The automobile industry had another prosperous year; new car sales for the nation exceeded the 1961 total by early November, and all indications were that the final figure would be the highest since the 1955 boom.

In the November elections, Republican George Romney, former president of American Motors, defeated incumbent John B. Swainson for governor (1,419,046 to 1,340,549), ending the 14-year hold on that office by the Democratic Party. Other state offices were captured by the Democrats. In congressional races, the 10 Republican and 7 Democratic incumbents were reelected. The Republicans gained a seat in the 4th District, and in the race for congressman-at-large former Democratic National Committeeman Neil Stabler defeated former Rep. Alvin M. Bentley.

Political observers attributed the defeat of Swainson to his veto of the Bowman bill and to the belief that the governor's office had become the symbol of voter frustration over the impasse on tax and fiscal reform. The governor's veto of the Bowman bill, which would have exempted nonresidents from Detroit's new 1% income tax, turned many suburban residents against him. Dissatisfaction over the relationships between the governor and the Legislature also was expressed by the voters in outstate areas when several Republican leaders were defeated in the spring primary elections.

The state Constitutional Convention which convened in October 1961 completed its work in mid-May. The new constitution, which will be presented to the voters in April 1963, was the result of compromise and was completely satisfactory to neither the Republicans nor the Democrats. The vote for acceptance by the convention was split almost exactly on party lines, with the majority Republicans supporting the document. The new constitution increases the governor's term from two to four years, and empowers him to reorganize executive agencies and reduce the number from the present 100-plus to 20. It provides for the election of some state administrative offices which are at present appointive, and also for a Court of Appeals to assist the state Supreme Court. A major issue in the document are its provisions for the apportionment of legislative districts. It calls for the establishment of 38 senatorial districts and for future apportionment based on a formula crediting 80% to population and 20% to area. Such apportionment was charged as being unconstitutional in a case pending before the U.S. Supreme Court.

The issue of redistricting the Senate was raised in a suit filed by State AFL-CIO President August Scholle, who charged that the existing apportionment, because of the disparity in population of the districts, violated the 14th Amendment to the federal Constitution. The Michigan Supreme Court's Democratic majority supported Scholle on July 18 and ordered a new reapportionment based on population. Failure by the Legislature to do this would have required senatorial candidates to run on a statewide basis in the fall elections. Republican leaders appealed the decision to the U.S. Supreme Court, and on July 27 won a stay from Justice Potter Stewart (pending a decision by the full court. (See also REAPPORTIONMENT AND REDISTRICTING.)

MICROBIOLOGY. See Index entry.

MIDDLE EAST

Among the most important contemporary factors in the Arab part of the Middle East (that is, the Middle East excluding the "northern tier" countries of Turkey, Iran, Pakistan, and Afghanistan) is the fundamental and irreconcilable opposition between two forces, neither of which is in truth very congenial to the United States and its allies.

Monarchies versus Socialist Revolutions.—On the one side in this clash are the traditional regimes, conservative in the extreme, patriarchal and autocratic, where all power is in the hands of the ruling family. In many cases these ruling families now derive fantastically high incomes from oil royalties. The kingdom of Saudi Arabia and the tiny sheikhdom of Kuwait both exemplify such traditional states. Opposed to them, and threatening them, are leftward programs aiming at the end of traditional regimes and the redistribution of property, and basing themselves on the stirring up of the masses. Such movements find inspiration and support in the "Arab Socialism" of President Nasser of the United Arab Republic (a grandiose title that disguises Egypt, which since the secession of Syria in September 1961 is no longer united with anything else). Nasser's measures against property owners in the fall of 1961, which precipitated the Syrian revolt, amounted to a declaration of war on his part against both the middle classes and the ruling sheikhs of the whole Arab world.

This basic antagonism was brought into sharp focus in September–October 1962 by events in the monarchy of Yemen, in southwestern Arabia. The death of the imam of Yemen was immediately followed by a pro-Nasser revolt in the Yemenite Army, which overthrew his successor, embarked on a purge of his supporters, hailed Nasser as the leader of Pan-Arabism, and promised the country a "socialist future." As was to be expected, Nasser undertook to give the new regime any military assistance which it required, while the cause of the overturned but ancient dynasty was taken up by Prince Hassan, who proclaimed himself the new imam and tried to organize a counterrevolution. He had support among many of the tribal chiefs, and also was promised the support of Saudi Arabia and Jordan.

Events in this rather minor state thus immediately conjured up, almost automatically, opposing forces throughout much of the Arab world, and led to the possibility of widespread involvement. King Hussein of Jordan, on October 21, declared his readiness to send support of every kind to the royalist cause in Yemen.

Whether ultimately successful in Yemen or not, the threat of leftward revolution was likely to push the more intelligent of the traditional Arab rulers in the direction of modernization. It appeared significant that in mid-October King Saud of Arabia, who had been acting as his own prime minister, dissolved his cabinet and appointed Prince Faisal, one of his numerous half-

A crowd in Ta'izz, Yemen, hails a speech by General al-Sallal, leader of a republican coup after the death of the old imam on September 19. The soldiers on the wall are Egyptians; President Nasser of the UAR gave his support to al-Sallal.

PICTORIAL PARADE

brothers, to head the new government. Prince Faisal is said to be an able administrator interested in saving the monarchy through introducing timely reforms.

Position of Nasser.—Insofar as Nasser of Egypt was concerned, events in Yemen meant an increment of prestige which was all the more welcome because it was rather obviously necessary. It has been noted that Nasser's political aims over the past year or two seem to have been concerned less with the Arab world and more with Africa, where indeed he is the most important political figure in the "Casablanca group" of states (see AFRICA). The erosion of the tremendous prestige which Nasser enjoyed in 1956 appears to be due chiefly to his desire to dominate rather than accept the position of working with equal partners.

Inherent in the situation in 1962 was the likelihood of ideological and political cooperation between Egypt and newly independent Algeria, another Islamic state. If Nasser was prepared to have such an alliance on equal terms (something he has not hitherto accepted with any Arab state), it would be a formidable left-wing threat to the remaining feudal monarchies of the Middle East. Nothing else but equality, however, would be acceptable to the momentarily disorganized but politically sophisticated Algerians.

Arab Disunity.—Basic dissensions within the Arab world brought its fragile political organization, the Arab League, to the very verge of final dissolution in 1962. Already boycotted by Premier Kassem of Iraq for its support of Kuwait in 1961, the league suffered a walkout by Egypt on Aug. 28, 1962. The incident took place at a meeting of the league convoked at Shtōra, Lebanon, at the request of Syria, to discuss its complaint against Egypt of interference in Syrian internal affairs. (The Syrian government in question was one which took office in March 1962 after a military coup d'état. The new regime was further to the left than the six-month-old government which it replaced, but not far enough to be willing to tolerate Nasser's habitual subversive attempts.)

The Egyptian delegation walked out of the league meeting in protest against the consideration of the Syrian complaint. The embarrassed remaining members, seeking a compromise, then arrived at the convenient conclusion that since Egypt had no representatives present it was impossible to consider the question. Nasser thus escaped censure, but his ambitions to lead the Pan-Arab movement seemed even further from realization. Events in the ambiguous political forum of Syria seemed likely to provide the clue to future trends in the Arab Middle East.

The Lebanon meeting had another interesting consequence in the announcement a few days later, after a meeting between King Hussein and King Saud, that the kingdoms of Jordan and Saudi Arabia would place their armed forces under a joint command, and would take measures to advance economic unity. It is difficult to assess the significance of such plans, of which there has been a plethora of late. However, the two kingdoms might well complement and strengthen each other against the chill threat of revolution; for Saudi Arabia is wealthy and Jordan poor, but Jordan has a bountiful supply of the trained military and civilian talent that Saudi Arabia lacks. If the *rapprochement* between Saudi Arabia and Jordan is real and permanent, it will put an end to an era of hostility between them.

South Arabian Federation.—At the very time when traditional rule was being challenged in Yemen, in the neighboring Aden Protectorate and Aden Colony the British government was engaged in an interesting piece of political construction based largely on cooperation with a considerable number of traditional native rulers. Negotiations in London in July resulted in the publication (August 20) of a White Paper outlining the government's plan to fuse Aden Colony with 11 of the emirates of the much larger Aden Protectorate (which have banded together as the Federation of South Arabia) to form a new political entity.

The first stage of this plan does not go beyond the setting up of a new federal capital city across the bay from the existing city of Aden and the creation of a federal parliament. It was hoped that Aden Colony and all the remaining emirates (there are 23 in all) would join later, and so create a new country about the size of Italy and with a population of just over 1 million, which would achieve full internal self-government by stages and, later, sovereignty and Commonwealth membership. A threat to this plan arose from the existence of two nationalist parties in the 75-square-mile Aden Colony, which could put up effective

Prince Talal of Saudi Arabia (right center), who rebelled against his brother, King Saud, meets President Nasser of the United Arab Republic (left center) in Cairo after he had publicly aligned himself with the policies of Nasser.

UPI

opposition to a political union with the totally autocratic emirates of the Protectorate.

If the plan succeeded, however, it would provide a secure political setting into the indefinite future for the British military base of Aden, which is, outside Cyprus, the one remaining British base in the Middle East. On it depends the defense of British oil interests in Kuwait and Trucial Oman and throughout the Middle East, as well as the discharge of Western treaty obligations to Iran and Pakistan.

The British plans for southern Arabia formed a parallel and complement to what that government was doing in the Far East in trying to create a new Federation of Malaysia (see FAR EAST). Both were attempts to integrate a vulnerable collection of small states into a viable and stable larger unit. If both attempts succeeded they would provide linchpins of security at the two ends of the Indian Ocean, from which British and other Western forces could operate as necessary. Throughout the 19th century, after their acquisition by Britain (Singapore in 1819, Aden in 1839), these two British bases were the twin foundations on which was secured the peace and stability of the whole vast Indian Ocean area. The two proposed federations were an ingenious attempt to enable that function still to be discharged in the widely changed circumstances of the later 20th century.

British oil interests in the Middle East were enhanced in 1962, and anxiety over possibly vulnerable Kuwait to some extent lessened, by a rich oil strike in the Persian Gulf sheikhdom of Abu Dhabi, in Trucial Oman. Oil production, which began in July, soon reached 30,000 barrels a day and was expected to go much higher.

The Non-Arab Middle East.—There was a paucity of major developments in the non-Arab countries of the Middle East. The new regime in Turkey completed two years in power in May, but the country was in a state of comparative stagnation and disillusionment. Israel continued to experience the unremitting hostility of her Arab neighbors, but their mutual enmities were such that not even her start in diverting Jordan River water to the Negev could unite them in action to prevent it. At a meeting of the Central Treaty Organization's Military Committee in London in April, Pakistan pressed for a unified command structure analogous to that of the North Atlantic Treaty Organization, but was unable to obtain progress in that direction. In a speech on August 6 at Quetta, President Ayub Khan of Pakistan advocated the fusion of the three Muslim states, Afghanistan, Iran, and Pakistan, into a greater political entity—a prospect remote as long as Pakistan and Afghanistan are not even on a basis of normal friendly relations. Between Pakistan and Iran, however, relations were indeed very close.

Perhaps the most interesting development, from the long-term point of view, was the proposal by the United States to furnish funds to develop the small south Iranian port of Bandar Abbas on the Indian Ocean into a first-class harbor having good communications with the north and east of Iran and also with Afghanistan. The beneficial possibilities of the project were so far-reaching that it could alter the whole economic and political pattern of that part of the Middle East.

MILWAUKEE

Wisconsin's largest city, Milwaukee had a population in 1960 of 741,324 (1962 est., 752,000), making it the 11th most populous city in the nation. The city's land area (1962) is 96.5 square miles. The Milwaukee metropolitan area, comprising Milwaukee and Waukesha counties (795 square miles), had a 1960 population of 1,194,290, 17th largest in the United States. Milwaukee city and county has a population (1962 est.) of 1,147,880.

Milwaukee has a long-standing reputation for clean, conservative government, with emphasis on high-quality services. Every four years (the next time in 1964) voters elect on a nonpartisan basis a mayor, attorney, comptroller, treasurer, and Common Council of 20 aldermen, 1 from each ward.

The total budget under control of the Common Council for 1963 was $114,421,881, including $10,023,117 for capital improvements. In addition, the city issued $18,895,000 in general obligation bonds and $2,000,000 in water revenue bonds for capital improvements.

The six-year capital improvements program called for expenditures of $215,782,292 through 1967. The city's bonded indebtedness in 1962 was $127,782,292.

Public school enrollment in 1962 was 112,647. For 1963, the public school budget was $53,525,744, in addition to $6,250,000 in school construction bonds. Parochial school enrollment in the area was 119,000.

Assessed value of real estate in Milwaukee in 1962 was $2,053,559,230, up $67,862,165 over 1961. Combined city and school taxes for 1963 rose for the 11th consecutive time. The rate was $47.42 per $1,000 of assessed valuation, compared with $45.73 in 1962. Assessments are made at about 53% of true value.

In mid-1962, 499,100 persons were employed, 2,100 over 1961, and 16,700 were unemployed in the two-county metropolitan area. The total value of manufactured products in Milwaukee County was about $3.14 billion. Primary products included engines, turbines, castings, heavy machinery, metal products, metal working machinery, and beer. Retail sales totaled $1.38 billion.

Seaway tonnage handled through the Great Lakes port of Milwaukee during 1962 was slightly lower than in 1961, the port's biggest year.

In 1962, Milwaukee won a six-year court fight with the village of Brown Deer for undisputed possession of most of the old town of Granville, an area potentially rich in industrial uses. The state Supreme Court transferred 4.5 square miles of the town from Brown Deer to Milwaukee, and permitted Milwaukee to keep an additional 11.5 square miles which the city had annexed.

The city's new South Side water plant was put into operation in 1962. Part of a $58 million expansion program, it increased productive capacity 25% and permitted unrestricted lawn sprinkling for the first time in years.

In May, the Hearst-owned Milwaukee *Sentinel* was shut down by a strike for the first time in its 125-year history. Publication resumed in July after the newspaper was purchased by the city's other daily, the Milwaukee *Journal.*

LAWRENCE C. LOHMANN,
City Hall Reporter, The Milwaukee "Journal."

MINERAL PRODUCTION

World mineral production again reached new peaks in 1961, in response to an ever-expanding demand for raw materials. According to the U.S. Bureau of Mines *Minerals Yearbook*, 43 of the 65 world and free world totals were higher in 1961 than 1960. Percentage gains ranged from a 1% gain in pig iron to an almost 40% gain in production of lithium minerals. There were 37 new

records established, 30 in the world group and 7 in the free world group.[1]

The United States was the leading producer of 29 of the 52 commodities for which totals for the entire world were compiled. Other free world countries led in 16 items, namely: Canada (asbestos, nickel, and platinum), Brazil (beryl), France (byproduct elemental sulfur), Republic of the Congo (industrial diamonds), Italy (mercury), Republic of Korea (graphite), Jamaica (bauxite), Japan (pyrites), Malaya (tin, mine and smelter), Mexico (fluorspar and silfur), Peru (bismuth), and Republic of South Africa (gold). The Sino-Soviet bloc ranked first in 13 items—the USSR in chromite, coal (all grades), coke (metallurgical), corundum, iron ore, lead (mine), magnesite, manganese ore, and peat; China in antimony and tungsten; and East Germany in coke (low-temperature) and fuel briquettes.

Africa continued in 1961 as the world's major source of mineral supply for over 97% of the world's industrial diamonds and over 99% of lithium minerals, and remained the chief source of columbite-tantalite minerals (82%) and cobalt (77%). It produced 52% of the world's gold in 1960. These contributions, together with 40% of the beryl and 34% of the chromite, clearly establish Africa's position as a major source of space- and nuclear-age metals. Africa also accounted for 21% to 31% of the 1961 supply of manganese ore, vanadium, antimony, copper, and platinum-group metals. In addition to its leading position in diamonds and lithium minerals, Africa produced important quantities of other nonmetallics: corundum (38%), vermiculite (26%), and phosphate rock (26%).

Because the United States imports well over half of its requirements of diamonds, lithium, flake graphite, columbite-tantalite minerals, strategic-grade long-fiber asbestos, cobalt, chromite, manganese ore, beryl, and antimony, the importance of Africa to the United States as a source of raw materials is apparent.

Latin America accounts for almost all of the free world's quartz crystal of piezoelectric quality. In 1961 the following percentages of United States imports came from Latin America: bauxite, 100; piezoelectric quartz crystal, 99; natural amorphous graphite, 77; bismuth, 80; crude petroleum and petroleum products, 68; cadmium, 66; iron ore, 59; copper, 74; antimony content of ore, 60; fluorspar, 68; beryl, 44; zinc, 61; and manganese ore, 51.

According to the Bureau of Mines, the value of all minerals produced in the United States in 1961 was $18,131,000,000, an increase of $17,896,000,000 over 1960. Natural gas and petroleum were chiefly responsible for the gain.

Since the United States government suspended Treasury sales of nonmonetary silver to domestic consumers in November 1961, the price of silver has advanced almost 40%. Consumption of silver continues to be greater than production. A preliminary estimate placed 1962 production at 235,200,000 fine ounces.

The USSR and Communist China release a few official statistics on mineral production. They provide a helpful base for the Bureau of Mines to estimate other facets of the mineral industry, and the bureau believes the data presented herein correctly reflect production trends and give a reasonably accurate picture of the order of magnitude and of the physical volume of production.

The following tables show the trend of production of the more important mineral commodities in the major producing countries during recent years. Totals include output of minor countries not listed. In some cases production data are too incomplete to justify showing a total. Listing usually includes countries that have produced more than 1% of the total at any time since 1939. (These tables are based largely on data supplied by the Foreign Activities Staff of the U.S. Bureau of Mines, with gaps filled from other sources.)

Figures in parentheses are for the preceding year, as a substitute for those lacking for the year indicated. A figure with fewer decimal places indicated than others in the same table is an estimate. A question (?) means unknown or an estimate; a dash (—) means no production reported.

BERENICE B. MITCHELL,
Commodity Industry Analyst, Division of Foreign Activities, U.S. Bureau of Mines.

MINERALOGY. See Index entry.

MINING

The laboratories and research centers of the U.S. Bureau of Mines made important contributions to the nation's growing demands for minerals and mineral fuels in 1962. New ground was gained in programs to develop improved mining techniques and to find better ways of producing conventional metals as well as high-purity materials for electronics, nuclear energy, and space exploration. Marked advances occurred in the mining, processing, and utilization of coal; in the making of iron and steel; and in the large-scale conservation of America's resources of essential helium.

Minerals Development.—Outstanding success was achieved during the year in one phase of the Bureau of Mines' iron ore program when a new blast-furnace feed, averaging about 80% iron, was tested in an experimental blast furnace operated by the bureau at Bruceton, Pa. Made from Lake Superior taconite and prereduced with North Dakota lignite, the pelletized feed made possible the highest productivity and lowest fuel-consumption rates ever recorded in operating the experimental furnace. Even more promising is the fact that the experimental methods used in preparing the pellets may ultimately contribute to economic processing of the nation's vast reserves of nonmagnetic taconite.

Another significant event occurred when Blast Furnace Research, Inc., an organization representing 22 major steel- and iron-producing companies in the United States and Canada, joined the bureau in a cooperative agreement under which ex-

BUCYRUS ERIE COMPANY

The dipper of the world's largest stripping shovel, used to mine coal in Kentucky, is bigger than a two-car garage.

tensive studies will be conducted utilizing the bureau's experimental furnace. This work, to continue for two years, will be directed toward further increasing efficiency and economy in blast-furnace operation and also improving the quality of the pig iron such furnaces produce.

Research on metallic tungsten and chromium was concerned mainly with developing fundamental scientific data, improving processing techniques, and broadening utilization of low-grade ores. The bureau's basic studies in vapor deposition of tungsten led more than 20 industrial firms to engage actively during the year in developing applications for its vapor-deposition process. Meanwhile, the bureau pursued new and promising methods for using domestic low-grade ores of tungsten and chrome. In addition, a successful laboratory technique was developed for making high-purity ductile molybdenum, a metal whose

heat resistance has won it consideration as a structural material for missiles and space vehicles.

Other metallurgical achievements of the year included development of processes for making vanadium alloys, vanadium, and high-purity nickel.

In the field of mining, research on mine-systems analysis advanced as industrial engineering principles were applied to operational problems. Studies to develop permissible angles for slopes of open-pit copper mines continued, and progress was made in devising mathematical and statistical techniques to indicate probability and cost of mineral discovery. Explosive anchorage of rock bolts for underground support in soft rocks showed promise, and a new series of tests was begun with bureau-developed precast concrete support sets of improved design.

Helium.—Large-scale conservation of irreplaceable helium resources began during the year with deliveries of the first helium to be conserved under helium-purchase contracts awarded by the government to four private companies. The contracts, providing for federal purchases of up to $47.5 million worth of helium annually for 22 years, were negotiated under authority of legislation that became effective in March 1961. On the basis of the purchase agreements, private firms are financing and building and will operate five plants in the Southwest that ultimately will recover some 62 billion cubic feet of the helium, which has many essential uses in industry and defense. The first installation built under the conservation program began operating late in 1962 near Bushton, Kans., and four others were scheduled to be on stream by the spring of 1963.

Helium purchased under the program will be transported through a 430-mile pipeline—constructed and operated by the government—to the federally owned Cliffside gasfield near Amarillo, Texas, where it will be stored underground until needed in the future. Wastage of helium—formerly at the rate of 4 billion cubic feet a year when natural gases containing the element were burned as fuel—will be drastically curbed.

In response to continued increase in demand during fiscal 1962, the Bureau of Mines shipped nearly 600 million cubic feet of helium, about three fourths of it to federal agencies.

A helium plant with a capacity of 65 million cubic feet a year, built by Kerr-McGee Oil Industries, Inc., Oklahoma City, Okla., began producing and marketing helium from the Pinta Dome field in eastern Arizona in November 1961. This operation, not a part of the government helium conservation program, is the first private venture into helium production since the 1930's.

A helium research program is an integral part of the helium conservation effort. Besides conducting studies to develop and improve techniques for extracting and saving helium, scientists at the bureau's new center in Amarillo perform fundamental investigations to learn more about the properties and uses of helium. Such research helps assure that the conserved helium will be used wisely and effectively to further scientific progress and to advance the national economy.

Fuels Research.—Bureau studies continued to stress improved methods of extracting, preparing, processing, and using mineral fuels.

During test demonstrations in Pennsylvania and Washington, jets of water under high pressure were used successfully in mining both anthracite and bituminous coal. Other experiments were conducted in which the explosive gas methane was removed by two different methods in advance of mining a bituminous coal seam in West Virginia.

Research to determine the feasibility of transporting relatively large sizes of coal hydraulically was aimed at combining hydraulic mining with coal pipelines and thereby making coal available to some markets at lower cost.

Development progressed on a coal-fired gas turbine for central-station power plants. Operated in conjunction with a standard steam boiler, such a turbine promises an increase of 4% to 8% in overall efficiency.

In other coal research, process development continued on converting bituminous coal to high-Btu. gas, on producing metallurgical coke from coals presently considered unsuitable, on irradiating coal and reacting it with superhot (30,000°C.) gases, and on obtaining jet aircraft fuel and other valuable products from coal carbon disulfide.

In petroleum research, 12 additional sulfur compounds were identified in crude oil from Wasson, Texas, and 8 in crude oil from Wilmington, Calif. More than 90 identifications have now been made of such compounds, which create costly problems in petroleum refining.

Health and Safety.—Highlighting bureau research in health and safety during the year were experiments and field tests demonstrating the versatility of rigid polyurethane foam in sealing and maintaining the stability of mine openings, controlling ventilation, combating mine fires, and insulating combustible material from heat. Made by combining two readily available chemicals which expand in seconds to many times their volume, this foam becomes rigid in a few minutes. It promises to be useful in many phases of mining.

In the effort to devise a practical methane-monitoring system for gassy mechanized coal mines, three prototypes were tested extensively in the bureau's Experimental Coal Mine near Bruceton, Pa. Results were so promising that two units are scheduled for further testing in an active mine.

After rigorous testing, bureau approvals were issued covering new types or models of many varieties of mining accessories, including electrical-mechanical equipment, coalmine roof drills with integral dust collectors, respiratory-protective devices, and fire-resistant hydraulic fluids. For the first time, the bureau approved diesel-powered equipment for use underground in gassy noncoal mines and tunnels.

MARLING J. ANKENY,
Director, U.S. Bureau of Mines.

MINISTRY, Canadian. See CANADA.

MINNESOTA

A North Central state of the United States, Minnesota ranks 12th among the states in area (land, 80,009 square miles; inland water, 4,059) and 18th in population (3,475,000 on July 1, 1962, a 1.8% increase from the 1960 census figure of 3,413,864). Urban places with populations above 15,000 in 1960:

Albert Lea	17,108	Minneapolis	482,872
Austin	27,908	Minnetonka	25,037
Bloomington	50,498	Moorhead	22,934
Brooklyn Center	24,356	Richfield	42,523
Columbia Heights	17,533	Robbinsdale	16,381
Crystal	24,283	Rochester	40,663
Duluth	106,884	Roseville	23,997
Edina	28,501	St. Cloud	33,815
Faribault	16,926	St. Louis Park	43,310
Fridley	15,173	St. Paul (*capital*)	313,411
Hibbing	17,731	South St. Paul	22,032
Mankato	23,797	Winona	24,895
Maplewood	18,519		

Government.—Chief executive and judicial officers in 1962 included Elmer L. Andersen (Republican), governor, serving a two-year term; Karl F. Rolvaag, lieutenant governor; Joseph L. Donovan, secretary of state; Val Bjornson, treasurer; Stafford King, auditor; Walter F.

Mondale, attorney general; Erling Johnson, commissioner of education; and Oscar R. Knutson, chief justice of the 7-member Supreme Court.

The Minnesota Legislature, which convenes in odd-numbered years, comprised a 67-member (nonpartisan) Senate in 1962 and a 135-member (nonpartisan) House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $922,252,640 included $408,971,511 from state taxes and $125,463,341 in federal funds. Chief tax yields were from selective sales and gross receipts ($209,932,619), individual incomes ($129,337,381), and property ($23,777,520). Spending of $935,504,655 included $215,066,487 for education, $217,494,846 for health, welfare, and safety, and $242,171,396 for highways.

Education.—In the 1960–61 school year, public elementary schools staffed by 14,990 teachers enrolled 359,459 pupils; junior-senior high schools with 15,134 teachers enrolled 280,038; and private and parochial schools with 5,631 teachers enrolled 163,253. College enrollment totaled 83,174.

Estimated public school spending in the 1961–62 school year totaled $392 million, including current expenditures of $295 million ($442 per pupil) and capital outlay of $75 million. Revenue of $450.5 million was drawn chiefly from state funds ($145 million) and local districts ($230 million). Teachers' salaries averaged $5,450 (high school, $5,700; elementary, $5,225). Actual spending for higher education (1961 fiscal year) amounted to $92,036,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 122,465 persons totaled $97,416,546. This amount included $50,721,927 for the aged and $21,841,852 for dependent children.

Transportation and Communications.—A total of 507 miles of highway construction and reconstruction was completed in 1961. *Highways and roads* on Jan. 1, 1962, totaled 124,588 miles (105,929 surfaced). These served 1,825,907 *motor vehicles* (as registered on Sept. 1, 1962), including 1,324,964 automobiles. Operating in the state were (1961) 23 *railroads* (using 8,150 line miles of track); 7 regularly scheduled *airlines;* and 129 commercial and municipal *airports* and 21 seaplane bases.

Communications media included (1962) 69 AM and 8 FM *radio stations;* 10 *television stations;* 25 daily *newspapers* (circulation, 2,011,289) and 364 other newspapers (750,158); and (January 1) 364,300 business and 1,101,300 residential *telephones.*

Labor Force.—The state's labor force in August 1962 included 315,000 agricultural workers. Nonagricultural employment totaled 1,003,986, compared with 978,000 a year earlier and an average of 958,400 during 1961. Of nonfarm workers, 24.7% were in manufacturing, 24.2% in trade, and 15.2% in government services. Unemployment in August 1962 was down to 53,600 from the 72,400 of the previous August. (See also below, *Events, 1962.*)

Manufacturing.—Manufacturing establishments in the state employed during 1961 an average of 228,400 persons who received $1,315,000,000 in wages. Adjusted value added by manufacture (1960) totaled $2,362,883,000.

LEADING MINNESOTA MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1] (in thousands)
Food and kindred products	50,316	$265,789	$558,148
Nonelectrical machinery	29,896	167,343	310,260
Printing and publishing	20,106	121,116	193,630
Paper and allied products	12,692	69,005	165,565
Instruments and related products	13,230	81,561	153,907
Chemicals and allied products	5,124	28,724	142,037
Stone, clay, glass products	9,360	51,477	137,396
Fabricated metals	14,252	76,515	127,818
Transportation equipment	9,101	53,143	109,423

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—Minnesota ranked 11th among the states in 1961 in the value of its mineral output, with 2.48% of the national total. The state ranked first in iron ore and in manganiferous ore production. Because of the drop in iron ore output, the state's total mineral value declined 13% from 1960.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $1,075,307,000, compared with $1,054,641,000 for the corresponding period of 1961. For the full year 1961, income comprised

MINNESOTA MINERAL PRODUCTION, 1961

(In short tons, except as noted)

Mineral	Quantity	Value
Clays	176,000	$ 241,000
Coke	...[1]	...[1]
Iron ore, usable (long tons)	44,699,000	407,152,000
Manganiferous ore (5 to 35% Mn.)	181,835	...[3]
Sand and gravel	30,690,000	24,143,000
Stone	3,957,000	9,975,000
Other minerals	...	9,404,000
Total	...	$450,509,000[3]

$1,070,671,000 from livestock, $439,249,000 from crops, and $78,710,000 in government payments. Principal income sources in 1961 were cattle, $335,523,000; wholesale milk, $304,180,000; hogs, $231,449,000; soybeans, $123,571,000; and corn, $118,956,000.

The state's 146,000 farms in 1959 had an acreage of 30,796,000 (18,918,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 4,258,000 cattle, 3,519,000 hogs, 1,024,000 sheep, and 17,957,000 chickens. An average of 225,000 family and 37,000 hired workers engaged in farming in 1961.

MINNESOTA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	282	370	325
Barley (1,000 bu.)	28,807	27,300	19,864
Corn for grain (1,000 bu.)	260,873	324,242	275,188
Flaxseed (1,000 bu.)	8,078	6,444	5,480
Oats (1,000 bu.)	185,386	159,988	147,192
Soybeans (1,000 bu.)	39,894	53,843	44,733
Wheat (1,000 bu.)	18,234	24,560	17,982

Events, 1962.—In the closest gubernatorial election in the state's history, only 142 votes in a total of more than 1.2 million separated Gov. Elmer L. Andersen, Republican, and Lt. Gov. Karl F. Rolvaag, Democrat–Farmer Laborite (DFL), when the returns were certified by the State Canvassing Board on November 29. The board declared Andersen the victor, 619,722 votes to 619,580; but the District Court granted Rolvaag's petition for a recount, which was in process at year's end.

A. M. Keith, DFL, was elected lieutenant governor, and four incumbents (two Republican and two DFL) were returned to the other state executive offices. Conservatives won control of both houses of the officially nonpartisan legislature for the first time since 1952. Four Republicans and four Democrat-Farmer Laborites were certified elected to the U.S. House of Representatives.

The biggest upset was recorded in the 5th District (Minneapolis) where state Sen. Donald M. Fraser, DFL, unseated Republican Walter H. Judd, a 10-term veteran of the House. Another long-time congressman, H. Carl Andersen, who had served in the House for 24 years, had lost his bid for renomination in the Republican primary after his name was linked with Texas financial manipulator Billie Sol Estes.

Three amendments to the state constitution were approved by the voters. The new laws permit investment of state funds in corporate securities as well as government bonds, abolish a state debt limitation of $250,000, and extend the biennial legislative session from 90 to 120 days.

Mayor George J. Vavoulis won a second term in the St. Paul municipal election on April 24, and three labor-endorsed candidates and three conservatives were elected to the City Council. Public housing and urban renewal were the major campaign issues. A plan presented to the council in

August for redevelopment of the St. Paul loop, proposing about $63 million in new construction, had widespread support from civic and business leaders.

On January 13 a new $8.5 million terminal for the Minneapolis–St. Paul International Airport was dedicated at Wold-Chamberlain Field. It is estimated that by the early 1970's, 4 million airline passengers will pass through the terminal each year.

In August the number of nonfarm workers employed in the state exceeded a million for the first time (1,003,986). However, employment in mining and related industries on the Iron Range remained below normal. General cargo shipping at Duluth, totaling 75,755 tons through September, was almost 50,000 tons under that for the same period of 1961. In this fourth season since the opening of the St. Lawrence Seaway, grave concern was being expressed about the failure of shipping to develop to the level expected for the Minnesota port city.

The Minneapolis *Star* and *Tribune* suspended publication for 116 days from April 12 to August 7 as the result of a strike by the Teamsters Union, which was later joined by four other unions.

MISSILES

The Cuban crisis of late 1962 emphasized the fact that the United States lacked an adequate defense against ballistic missiles. It also revealed that the Soviet Union had probably surpassed the United States in the development of mobile medium-range missiles. The deterrent effects of the U.S. Strategic Air Command and of the many intercontinental ballistic missiles (ICBM's) known to be operational at the time were seemingly sufficient, nonetheless, to force the Soviet Union to order dismemberment of its Cuban-based strategic missiles. (See also CUBA; INTER-AMERICAN AFFAIRS; UNITED STATES.)

By the end of 1962, the United States had 200 nuclear-tipped ICBM's in operational readiness and assigned targets in the Soviet Union. Emplaced in bases spanning the nation, these missiles—126 Atlases, 54 Titans, and 20 Minutemen—reportedly gave the United States at least twice the ICBM strength of the Soviet Union.

Antimissile Missiles.—Top defense officials admitted early in the Cuban crisis that the United States had no military defense against the ballistic missiles deployed in Cuba, 90 miles south of the United States mainland. Advocates of the Army's three-stage Nike-Zeus missile pointed out that if the U.S. Department of Defense had properly encouraged development of this antimissile missile system it could have been placed in operation in a matter of months instead of years.

This opinion was reinforced by an earlier spectacular success of the Nike-Zeus in intercepting an Atlas ICBM nose cone re-entering the earth's atmosphere in a test on July 19, 1962. An Atlas was launched from Vandenberg Air Force Base, Calif., across the Pacific Missile Range. On Kwajalein Atoll, about 4,700 miles away, Nike-Zeus acquisition radar detected the approaching target, computers calculated its trajectory, and a launcher fired a Zeus to intercept it. The "kill" reportedly was made at an altitude of between 100,000 and 200,000 feet, the first time a reentering body was known to have been intercepted by an antimissile missile. Although the Zeus did not physically contact the Atlas nose cone, its approach was within the lethal radius of a nuclear warhead—a sufficient condition for destruction.

Despite this success, the Defense Department did not approve eventual Nike-Zeus production by the Army; but money was available for continued development work. The main objections to the Zeus weapons system were that it could not distinguish between warheads and decoys, and could not satisfactorily handle a saturation attack of many warheads. Army proponents of Zeus disputed these criticisms.

DIRECTORY OF MAJOR U.S. MISSILES

Missile	Status[1]	Service	Approx. range (miles)[2]	Engine type
		Surface-to-Surface		
Atlas	O	Air Force	5,500–9,000	Liquid rocket
Corporal	O	Army	75	Liquid rocket
Davy Crockett	O	Army	Short	Solid rocket
Honest John	O	Army	12	Solid rocket
Jupiter	O	Air Force	1,500+	Liquid rocket

Astor	D	Navy	11	Solid rocket
Subroc	O	Navy	25–30	Solid rocket

[1] Status code: O, operational; D, under development; P, in production; S, under study; T, under test; C, cancelled. [2] Nautical miles unless otherwise indicated; 1 nautical mile equals 1.15 statute miles. [3] Range in yards.

Three days before the Zeus test, Soviet Premier Nikita Khrushchev claimed that his country had an antimissile system that could "hit a fly in the sky." Defense Secretary Robert S. McNamara subsequently answered the Russian boast by pointing out that the Zeus shot "evidences the extensive and continuing nature of the United States program to understand the capabilities and limitations of antimissile systems."

The Nike-Zeus scored two more Atlas intercepts in late 1962, one on December 12 and a most remarkable one ten days later. In the last test the antimissile missile made the first known "kill" of an ICBM deploying decoys, thereby showing that the Nike-Zeus in at least one instance was able to discriminate between false targets and a true one.

The Army, because of recognized Zeus limitations, began studying an advanced Zeus concept called Sprint. At the same time, the Air Force began studies of an antimissile missile that could intercept unfriendly ICBM's in the launch or "coast" phase rather than during re-entry.

Strategic Missiles. *MMRBM.*—The Defense Department's search for a mobile medium-range ballistic missile (MMRBM) seemingly ended in 1962 when the Air Force obtained congressional approval to proceed with the missile's development. Air Force officials testified that development of the MMRBM was well within United States technical capacity, and that it could be built mostly with easily available components, thereby saving much time and money. The new missile would have a range of about 1,500 nautical miles, filling the gap between the 400-nautical-mile Pershing and the ICBM's. It could be transported on secondary as well as primary roads and readied for firing in a few minutes. Unlike the Pershing, it would not need a presurveyed site; unlike the cancelled railroad-borne Minuteman ICBM, it would not be confined to routes along railway tracks.

The Navy agreed to take part in the program to develop a version that could be mounted on warships, merchant ships, and barges. One MMRBM design called for a two-stage, solid-propellant rocket about four feet in diameter and roughly one half to one third the length of existing IRBM's.

The MMRBM concept was supported by Gen. Lauris Norstad, North Atlantic Treaty Organization (NATO) commander (retired effective Jan. 2, 1963), who said that it had to be developed shortly if NATO was to retain a powerful, up-to-date missile deterrent.

By the end of 1962, MMRBM development had fallen many months behind the original Defense Department schedule. One reason was the Pentagon's difficulty in making final decisions about requirements. Another was NATO's apparent disinclination to share an estimated cost of at least $2 billion for research, development, and deployment of an undetermined number of missiles. Unless the NATO nations helped pay for developing the MMRBM, the United States said, the weapons system would be used solely for unilateral development.

Polaris.—The long lead of the United States over the Soviet Union in missile-carrying submarines increased even further in 1962 when the Defense Department revealed plans to increase the Navy's Polaris-armed fleet from 29 craft to 41.

Fired from underground silos, the Air Force's Minuteman missile, seen in flight (*center*), became operational December 11. (*Top*) Two-man launch crew works 70 feet underground. (*Bottom*) An Air Force technician emerges from deep silo.

WIDE WORLD; "THE AIRMAN," USAF; UPI

By November 1962, six of the nuclear submarines —each carrying 16 Polaris missiles tipped with thermonuclear warheads—had been deployed in the North Atlantic, and three others were in commission awaiting assignments.

To give the Polaris fleet added power, the Navy announced late in 1962 that it would establish a base on Guam to service nuclear submarines on long patrols in the Pacific. The strategic location of the base would help the missile submarines maintain constant surveillance of the coasts of mainland China and Siberia. It would also put nearly all of China and the eastern third of the Soviet Union within reach of the 1,500-nautical-mile Polaris A-2 missile, which was placed in service in 1962. In mid-1964, when the 2,500-nautical-mile Polaris A-3 will become operational, no part of these countries would be out of range very long, particularly when navigation under the North Pole becomes routine. (The Polaris A-3 exploded in a test flight in the Atlantic Ocean on December 6, its sixth misfire in six test flights.)

The versatility of the Polaris submarines was ensured not only by the combination of the planned base on Guam, a similar operating one at Holy Loch, Scotland, and several others on both ocean coasts of the United States, but also by a projected supporting fleet of five tenders and six resupply ships, plus a number of floating drydocks and other support ships. The first tender specifically designed to serve Polaris submarines, the U.S.S. *Hunley,* was commissioned in the summer of 1962; effectively a floating missile base, it had 52 repair shops, room for about 1,400 officers and men, and sufficient stores and spare parts to fill a supply center.

The United States on May 6, 1962, fired its first missile-carried nuclear warhead when a Polaris was launched on a test flight from the nuclear submarine *Ethan Allen.* Although few details were announced, the missile reportedly was launched while the submarine was submerged; it was propelled to the target area 1,400 nautical miles away, and the warhead was detonated high over the Pacific.

Minuteman.—The Minuteman, the United States' first solid-fueled second-generation ICBM, was successfully launched on a short flight from Vandenberg AFB late in 1962 in the first test of the complete weapons system, including ground-support equipment. In October the Air Force disclosed some details of an advanced Minuteman, purportedly a vastly improved model scheduled for operation in 1965 or 1966.

The new Minuteman was described as a "quantum jump" better than the old one—not merely a slight improvement. Most of the improvements would be in the second stage; the missile would have higher specific impulse, a lighter motor case, and increased diameter. The changes were designed to build more range and payload into the Minuteman so that it could be dispersed almost anywhere and still be able to hit targets as distant as those in the Soviet Union. The original Minuteman designs were not optimum because military conditions at the time called for relatively inexpensive ICBM's, highly invulnerable and quickly operational. The advanced version was expected to cost about the same as the older one—$3.5 million.

In April 1962 the Minuteman assembly plant at Ogden, Utah, began turning out the first production missiles of the early design for test flights at Vandenberg AFB and for installation in underground silos at Malmstrom AFB, Mont.

Congress approved the Defense Department's recommendations for the fiscal year 1963 to increase the number of Minuteman units from 600 to 800. During the appropriation hearings, Gen. Curtis LeMay, Air Force chief of staff, said that in operational squadrons the Minuteman missile can react in about 30 seconds. On another occasion, Gen. Thomas S. Power, commander of the Strategic Air Command (SAC), pointed out that Minuteman units are extremely difficult to destroy; when emplaced in silos, it would take separate bomb blasts, even of 50-megaton weapons, to destroy each Minuteman unit.

The first Minuteman site went operational on Dec. 11, 1962, at Malmstrom AFB. Containing 10 missiles, the complex was the first of a full-strength total of 15 similar sites scheduled to be operational at Malmstrom by late spring or early summer of 1963.

Titan.—Titan II, the most powerful ICBM under United States development, on its first flight (March 16, 1962) roared 5,000 miles down the Atlantic Missile Range. This remarkably long maiden trip gave the United States a missile able to send nuclear warheads nearly halfway around the world, and a new booster vehicle for military and civilian spacecraft.

Deployed in hardened underground silos, this 103-foot, 430,000-pound-thrust missile can fire within a minute after the command is given. The first Titan II squadron was scheduled to be operational in 1963.

Titan II's first space mission—also starting in 1963—is to boost Gemini spacecraft into orbit to test men and equipment for the Apollo lunar program.

Titan III—Titan II with two strapped-on 1-million-pound-thrust solid rockets—will be built for civilian space missions and to launch the Air Force's Dyna-Soar (X-20) manned orbital spacecraft, which was scheduled to be operational in 1965.

SAC took delivery of the first operational Titan I squadron of nine missiles at Lowry AFB, Colo., on April 18, 1962, and of the second squadron, also at Lowry, on May 8, 1962. The completed base will hold six squadrons of this liquid-fueled missile in combat readiness. Titan II uses storable, hypergolic fuel—propellants that ignite on contact and produce a glowing hot-gas exhaust instead of flame.

Atlas.—The first squadron of 9,000-nautical-mile Atlas F's, the latest and most powerful version of the Atlas series, was turned over to SAC at Schilling AFB, Kans., on Sept. 13, 1962. A SAC crew at Vandenberg AFB had fired an Atlas F on its first launch from an operational prototype silo on Aug. 1, 1962; the missile was raised to the surface and sent on a 5,000-nautical-mile flight.

The United States arsenal of Atlas ICBM's reached full planned strength on Dec. 19, 1962, when SAC took over a 12-missile squadron of Atlas F's at Plattsburgh AFB, N.Y. This gave the nation a total of 13 squadrons of D, E, and F Atlas ICBM's dispersed at 11 bases, each holding between six and 12 missiles, and making up a total force of 126 operational Atlases.

To guard against the accidental firing of an Atlas missile, the Air Force set up a control requiring each of two persons to perform separate operations within three seconds of the other before an Atlas F could be launched.

Skybolt.—The cancellation by President Kennedy of plans to produce Skybolt—a 1,000-nautical-mile, air-launched ballistic missile—was announced on Dec. 21, 1962, in a joint communiqué issued at the end of a four-day meeting between the president and British Prime Minister Macmillan

at Nassau, the Bahamas. The reasons given for the cancellation were excessive costs and technical difficulties. By scrapping the program the United States stood to save about $2.5 billion, according to administration estimates. The Skybolt's job, it was said, could be done more efficiently by other proved missiles now in operation, particularly the Polaris and Minuteman.

Several congressmen, however, maintained that the president was endangering the country by putting "all of our eggs in the long-range missile basket." Many British critics, too, were bitter with the administration for ending a program on which Great Britain had based her nuclear deterrence. The nuclear-tipped Skybolt had been planned to be operational in 1964, but Secretary of Defense McNamara and a few military scientists said it could not be ready before late 1966. The B-52G and H were expected to carry four of the missiles in addition to a normal bomb load; British Vulcan bombers were to carry two. In effect, then, Skybolt had been intended to extend the useful life of the bomber fleets of both the United States and Great Britain.

Tactical Missiles.—The first tactical firing of the Sergeant missile by U.S. Army artillerymen on Oct. 24, 1962, at Ft. Sill, Okla., opened the way for the missile's deployment in Europe early in 1963. The Sergeant was to replace the cumbersome and slower-acting Corporal, which is liquid-fueled and radio-controlled. The newer missile uses solid fuel and has all-inertial guidance, and it can be transported by air.

Operationally, the Sergeant lies between the short-range Honest John or Lacrosse and the longer-range Redstone and Pershing. The 34-foot missile will be used to support a field army corps, and will be able to deliver a nuclear, chemical, or biological warhead 75 nautical miles away. West Germany bought the system late in 1962, and other nations were expected to follow; the nuclear warheads, however, will remain under United States control.

The Davy Crockett, a jeep-mounted nuclear-tipped missile for close support of combat troops, reportedly was sent to units of the United States Seventh Army in Germany in 1962. The Army said that the weapon, which has a fractional nuclear yield and negligible radiation, could be used against targets such as pillboxes, artillery positions, bunkers, troop and armor concentrations, command posts, and supply dumps. Its effective blast radius is believed to be from 200 to 500 yards. Other military units in Germany, and perhaps some in Korea, were due to receive Davy Crocketts; their nuclear warheads, for security reasons, will be kept at ordnance depots.

The Army's Nike-Zeus antimissile missile, shown on test flight from Pt. Mugu, Calif., twice intercepted missiles over the Pacific Ocean in 1962 test firings.

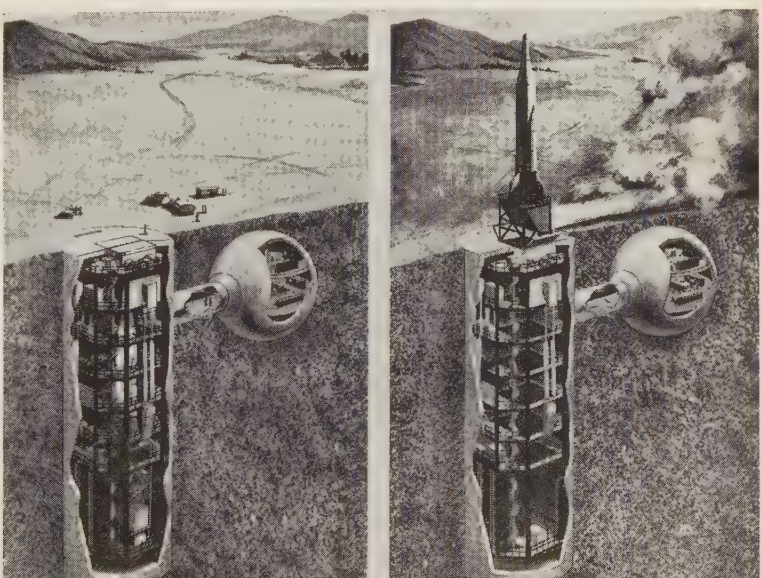
UPI

A Navy Sparrow III air-to-air missile fired from an F4H Phantom II jet fighter hit a Regulus II target missile head-on and destroyed it in a test over the Pacific in August 1962. Both missiles were flying at supersonic speeds. Described as the first time that an air-launched missile had made such an intercept of a surface-launched missile, the event was particularly significant because it showed the high accuracy of Sparrow III's semi-active radar homing device.

The Army in 1962 contracted for studies of a new tactical weapons system at first called "Missile B" and then "Lance" to replace the shorter-range Honest John and Lacrosse. Intended to significantly increase both nuclear and non-nuclear supporting fire on the battlefield, Lance is to be highly mobile, rugged, and reliable. Possibly jeep-mounted, the weapon will mark the Army's first use of a prepackaged liquid propellant.

Missile Technology.—Most of the missile research in 1962, as in previous years, was concentrated on the development of high-temperature materials to withstand the stress of the rocket environment, and of high-energy propellants which would permit a reduction in rocket sizes.

The National Aeronautics and Space Administration (NASA) disclosed that it was considering



Artist's conception of an underground silo for the Atlas ICBM shows (*left*) the missile being checked and fueled for a flight and (*right*) the Atlas raised and ready for firing. Control room is housed in spherical structure to the right of the silo itself.

U.S. AIR FORCE

supporting development of a fluorine-hydrogen upper-stage rocket engine. NASA and the Air Force said that they had been working with the potent mixture for a decade and that the basic engine design was already nearly complete. The first experimental engine was expected to take at least three years to produce.

The Navy reported that it had successfully tested a hybrid propulsion system in free flight, using a combination liquid and solid propellant in a single motor.

Illustrating how long prepackaged liquid propellants could be stored, Thiokol Chemical Corp. successfully fired two packaged liquid-fuel rocket engines after they had been stored for three years.

The Air Force, Aerojet-General, and United Technology Corp. reported highly promising methods for steering large solid-propellant rockets. The system involves injecting a gas or liquid into the rocket exhaust to create a shock wave which deflects the exhaust in the desired direction. The method was also successfully used in 1961 by the Lockheed Aircraft Corp. on test-flight versions of the Polaris. (See also CHEMISTRY.)

Missile Developments in Other Countries. *Soviet Missiles in Cuba.*—The United States probably learned more about strategic Soviet missiles during the Cuban crisis than through earlier intelligence efforts. United States photographic reconnaissance planes flying over Cuba in late October 1962 obtained evidence of more than 30 operational Soviet medium-range ballistic missiles (MRBM's) and of fixed-site bases for IRBM's. Military experts tried unsuccessfully to identify these missiles with known ones (such as those the Soviet had demonstrated at May Day parades) or as derivatives of known ones. Defense Department photo interpreters described the MRBM's as mobile, apparently liquid-fueled, and with a range of 1,000 nautical miles. Secretary of Defense McNamara said they were "planned to have a capability to be deactivated, moved, reactivated on a new site, and ready for operations within a period of about six days." Other observers set this figure at less than a day.

The United States in 1962 had no missile comparable to these Soviet MRBM's, although Congress had appropriated money for development of the MMRBM—a missile presumably far superior to the Soviet model. The United States did have the Pershing mobile missile, which was nearing the end of its flight-test program, however; but the weapon would not be operational until the close of 1963, and its range was only about 400 nautical miles.

In discussing warheads for the Soviet strategic missiles on Cuban soil, Secretary McNamara said that it was extremely difficult to specifically identify nuclear warheads. But, he added, it was fair to assume that such warheads were on the island. He added that the missiles could carry medium-size nuclear warheads. (By this the military usually means the warhead yield is somewhere between 20,000 and 1 million tons of TNT.)

No IRBM's appeared in the reconnaissance photographs released by the Defense Department, although sites for the missiles were seen in various stages of construction. Judging from the IRBM sites, and possibly other information, defense officials said the missiles to be fired from these sites would have a range of 2,200 nautical miles and would probably be liquid-fueled.

Two other types of missiles were delivered by the Soviet Union to Cuba: surface-to-air missiles for air defense, and sea surface-to-surface missiles mounted on patrol boats and used for coastal defense against naval attack. The naval missiles, a Defense Department spokesman said, were ship-directed short-range missiles, of the type that would not be used against a land target under anything but the most extreme circumstances. Mounted on Komar motor patrol boats, these missiles carried non-nuclear warheads.

By November 10, United States surveillance operations reported that all of the 42 offensive missiles which the Soviet Union had said were on the island had been dismantled and were on ships outward bound from Cuba.

Great Britain.—In a sweeping economy drive in August 1962, Great Britain canceled development of its Blue Water surface-to-surface tactical missile and announced that all long-range missile bases would be closed down by the end of 1963. The end of the Blue Water program would leave the Royal Artillery without direct control over a tactical nuclear weapon in the field; the United States nuclear-tipped Corporal and Honest John were to go out of British service in 1966. This meant that more emphasis would be placed on improving the mobility and conventional firepower of the army so that it could more effectively fight limited wars—a position that the United States had long urged Great Britain to take. The Royal Air Force, however, had won a clear-cut victory over the army; its spokesmen had been insisting that tactical missiles should be air-launched.

Britain in 1958 had signed a five-year agreement with the United States to build long-range missile bases in England; these were eventually filled with sixty 1,500-nautical-mile Thors. The arrangement could be terminated by either party, however, on six months' notice—which England gave, effective by the end of 1963. The most important reason for this termination was that maintenance of the bases is expensive. Thors are also highly vulnerable to enemy attack, since they are deployed above ground, and, moreover, they have been regarded only as interim weapons. Finally, the bases were vigorously opposed by pacifist groups, an important faction in England.

Nevertheless, Britain expected to arm itself with United States Skybolts mounted on Vulcan bombers. These missiles were to provide a strategic weapon as well as the nuclear prerogative for the British, who were to design and produce their own nuclear warheads for Skybolts. Thus Britain's cry of anguish was profound when in December 1962 the country learned that Skybolt had been cancelled.

The prime result of the Kennedy-Macmillan conference in mid-December was the Pact of Nassau, which laid the groundwork for a NATO nuclear force equipped with British-built Polaris submarines. Instead of Skybolts, the United States agreed to provide Polaris missiles (less their warheads) for British submarines. Britain, in turn, would develop the warheads and the underseas craft for integration into what would then become a "multilateral NATO nuclear force." The British, however, do not expect to have Polaris submarines operational until 1969 or 1970.

UAR.—The United Arab Republic publicly fired its first missiles—four single-stage rockets—on July 21, 1962. UAR President Gamal Nasser said they could reach "a little south of Beirut"—or Israel. Although he did not admit having foreign technical advisers, it was assumed that Dr. Eugen Saenger, a German rocket scientist who had been discharged as director of the Stuttgart Institute of Jet Propulsion Techniques, was the scientific leader of the Arab effort. (West German authorities reportedly dismissed Saenger because of his role in the UAR's rocket work.) Nasser maintained these were not the first UAR-launched rockets; he said that others had been fired in May 1961, two months before Israel had sent its "weather rocket" 50 miles into the sky.

Israel.—The Kennedy administration in September 1962 agreed to send Hawk ground-to-air missiles to Israel to correct a growing imbalance in the Middle East caused by the Soviet Union's furnishing missiles and jet military aircraft to Israel's enemies, the UAR and Iraq. The Hawks were described as purely defensive, short-range weapons to be used to protect key Israeli installations.

WILLIAM BELLER,
Senior Editor, "Missiles and Rockets."

MISSISSIPPI

A South Central state of the United States, Mississippi ranks 32d among the states in area (land, 47,223 square miles; inland water, 493) and 28th in population (2,248,000 on July 1, 1962, a 3.2% increase from the 1960 census figure of 2,178,141). Urban places with populations above 15,000 in 1960:

Biloxi	44,053	Jackson (*capital*)	144,422
Clarksdale	21,105	Laurel	27,889
Columbus	24,771	Meridian	49,374
Greenville	41,502	Natchez	23,791
Greenwood	20,436	Pascagoula	17,155
Gulfport	30,204	Tupelo	17,221
Hattiesburg	34,989	Vicksburg	29,143

Government.—Chief executive and judicial officers in 1962 included Ross R. Barnett (Democrat), governor, serving a four-year term; Paul B. Johnson, lieutenant governor; Heber A. Ladner, secretary of state; E. Evelyn Gandy, treasurer; William D. Neal, auditor; Joseph T. Patterson, attorney general; Jackson M. Tubb, superintendent of public education; and E. Harvey McGehee, chief justice of the 9-member Supreme Court.

The Mississippi Legislature, which convenes in even-numbered years, comprised a 49-member Senate in 1962 (all Democrats) and a 140-member House of Representatives (all Democrats).

Legislation, 1962.—The Legislature held one regular and two special sessions during the year. Among the more important measures enacted at the regular session (January 2–June 2) was the congressional redistricting law which reduced the number of districts from six to five by combining the 2d and 3d districts.

General fund appropriations for the 1962–64 biennium amounted to $289,065,545, an increase of $20,461,973 over the previous biennium. Of the appropriations, $180,316,614 was for schools, colleges, and other educational

activities. Revenue laws to provide additional funds of approximately $18 million to offset the increase included higher taxes on tobacco products, liquor sales, ginning of cotton, and contractors.

An important reform in state administration was effected by a law abolishing the office of state tax collector, whose duties were transferred to the State Tax Commission. A board was created to provide state supervision of savings and loan institutions; an additional circuit court district was created; and the name of Mississippi Southern College was changed to University of Southern Mississippi. Another law implemented the 1960 constitutional amendment making "good moral character" a qualification for voting by requiring county voter registrars to determine whether applicants are qualified after publishing their names in the county newspaper and permitting challenges as to moral character by affidavit of any qualified elector.

The two special sessions (September 18–October 6 and November 13–December 21) were concerned largely with plans for reapportionment of the Legislature. Reapportionment had been ordered on a basis of population in both houses by a state chancery court in Hinds County on June 7, but the order was held in abeyance until November 24 (later extended to December 19) pending reapportionment efforts by the Legislature.

A legislative reapportionment measure enacted on October 6 was defeated by the voters in November. The second special session thereupon proposed another constitutional amendment which would lessen rural control by rearranging seats and reducing membership of the House from 140 to 122 while increasing that of the Senate from 49 to 52. The new plan was to be voted on at a special election scheduled for Feb. 5, 1963. The second session also appropriated an additional $4,750,000 for raising teachers' salaries and $1,000,000 for increasing welfare payments. (See also below, *Events, 1962.*)

Finance.—In the 1961 fiscal year, revenue of $334,455,078 included $187,413,259 from state taxes and $106,335,452 in federal funds. Chief tax yields were the 3% general sales tax ($71,727,000) and taxes on corporate incomes ($12,518,000) and motor fuels ($46,822,000). Spending of $355,107,689 included $90,970,685 for education, $69,545,700 for health, welfare, and safety, and $78,771,945 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 11,085 teachers enrolled 358,430 pupils; junior-senior high schools with 7,521 teachers enrolled 227,077; and private and parochial schools with 932 teachers enrolled 19,050. College enrollment totaled 41,480 in 47 institutions, including 30 junior colleges and 17 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $148,522,000, including current expenditures of $110,500,000 ($220 per pupil) and capital outlays of $30 million. Revenue of $144 million was drawn chiefly from state funds ($87.5 million) and local districts ($35.5 million). The state reported teachers' salaries as averaging $3,531.58 (high school, $3,745.72; elementary, $3,386.28). Actual spending for higher education (1961 fiscal year) amounted to $41,042,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 160,434 persons totaled $48,503,950. This amount included $32,415,281 for the aged and $8,838,908 for dependent children.

Transportation and Communications.—A total of 313 miles of highway construction and reconstruction were completed in the 1962 fiscal year. *Highways and roads* on Dec. 31, 1961, totaled 63,993 miles (18,055 surfaced). These served 823,305 *motor vehicles* (as registered on Oct. 31, 1961), including 583,868 automobiles. Operating in the state were (1961) 18 *railroads* (using 3,668 line miles of track); (1962) 3 regularly scheduled *airlines;* and 51 public *airfields.*

Communications media included (1962) 76 AM and 2 FM *radio stations;* 6 VHF *television stations;* 18 daily *newspapers* (1961 circulation, 266,010) and 120 other newspapers; and (January 1) 126,100 business and 354,900 residential *telephones.*

Labor Force.—The state's labor force on July 15, 1962, included 208,180 agricultural workers. Nonagricultural employment totaled 419,200, compared with 405,800 a year earlier and an average of 415,950 for the 12 intervening months. Of nonfarm employees, 30.5% were in manufacturing, 20.9% in government services, and 20.3% in trade. Unemployment on July 15, 1962, was down to 34,500 from 55,700 a year earlier.

Manufacturing.—Manufacturing engaged 108,728 workers in 1960, including 90,961 in production, and provided a payroll of $357,893,000. Adjusted value added by manufacture totaled $702,318,000.

LEADING MISSISSIPPI MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1]
Food and kindred products	14,480	$46,224	$102,406
Paper and allied products	8,067	41,348	88,290
Apparel and related products	23,499	53,683	75,439
Lumber and wood products	18,621	46,056	74,989
Chemicals and allied products	3,890	17,846	67,645

Mining.—Mississippi ranked 21st among the states in the value of its minerals in 1961, with 1.16% of the national total. The value, up 7% from 1960, showed an increase for the 10th consecutive year. Mineral fuels constituted 90% of the total.

MISSISSIPPI MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	1,104,000	$ 5,034,000
Natural gas (1,000 cu. ft.)	172,543,000	32,093,000
Natural gasoline (1,000 gal.)	25,135	1,625,000
Petroleum (1,000 bbl.)	54,492[1]	153,667,000[1]
Petroleum gases (1,000 gal.)	15,510	700,000
Sand and gravel	5,920,000	5,903,000
Stone	913,000	1,044,000
Other minerals	...	11,070,000
Total	...	$210,242,000[2]

[1] Preliminary. [2] Total adjusted to avoid duplication in value of raw materials used in manufacturing cement or lime. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $371,635,000, compared with $284,452,000 for the corresponding period of 1961. For the full year 1961, income comprised $267,313,000 from livestock, $401,050,000 from crops, and $16,910,000 in government payments. Prin-

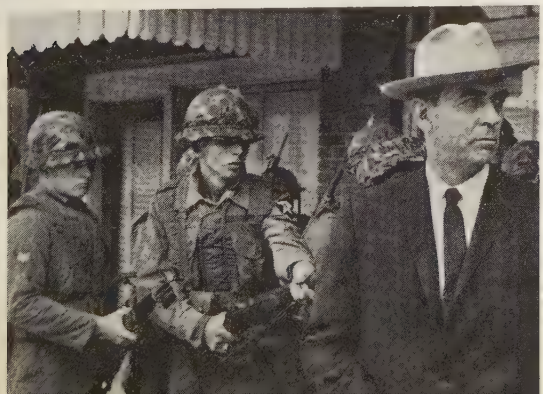
UPI - WIDE WORLD



cipal income sources in 1961 were cotton lint, $274,448,000; cattle, $97,246,000; broilers, $57,806,000; and soybeans, $51,224,000.

The state's 138,000 farms in 1959 had an acreage of 18,630,000 (4,565,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 2,107,000 cattle, 553,000 hogs, and 8,981,000 chickens, and (1961) 135,683,000 broilers. An average of 182,000 family and 64,000 hired workers engaged in farming in 1961.

MISSISSIPPI CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Corn for grain (1,000 bu.)	34,234	34,515	20,628
Cotton lint (1,000 bales)	1,600	1,625	1,700
Cottonseed (1,000 tons)	655	671	707
Oats (1,000 bu.)	9,059	7,697	5,148
Pecans (1,000 lb.)	10,965	25,500	8,000
Rice (1,000 bags)	1,219[1]	1,452[1]	1,568[1]
Soybeans (1,000 bu.)	11,824	23,490	22,560
Tung nuts (tons)	29,000	62,200	11,000

Events, 1962.—The year's major story concerned the admission of James H. Meredith, a Negro, to the University of Mississippi, thus breaking the color barrier in public education in the state. The case provoked a bitter clash between state and federal authorities—a struggle which finally erupted in violence—and attracted keen interest throughout the nation and the world.

Meredith, a resident of Kosciusko, first applied for admission in January 1961. Denied entrance by the university, he brought suit in the federal district court, beginning a series of legal actions which were brought to a climax on Sept. 10, 1962, when Justice Hugo L. Black of the U.S. Supreme Court, after consultation with his colleagues, refused to review a lower court decision favorable to Meredith. The district court then issued an injunction on September 14 designed to protect Meredith's admission.

On his appearance at the university on September 20, however, Meredith was refused admission by Gov. Ross R. Barnett, acting as admissions officer by authorization of the governing board of the institution. After the U.S. Court of Appeals issued an injunction on September 25 restraining the governor, lieutenant governor, and other state officials from interference, Meredith was again rejected by Barnett in Jackson that day and by Lt. Gov. Paul B. Johnson in Oxford the following day. Meanwhile, officials of the university and members of the governing board had appeared before the district and appellate courts on contempt charges and had been acquitted after agreeing to admit Meredith.

On Sunday afternoon, September 30, Meredith, accompanied by federal marshals, was escorted onto the campus by Mississippi highway patrolmen. About 8 P.M. a riot broke out between federal officers and a large crowd of students and others, many of whom were not residents of the state. Later, state highway patrolmen were withdrawn from the campus, but the arrival of National Guard troops around midnight alleviated the situation. The subsequent arrival of Army units brought the rioting to an end on the university campus just before dawn and in the town of Oxford by noon on October 1. The night's fighting resulted in the deaths of a French newspaperman and a local citizen, and caused scores of injuries.

Meredith was enrolled on October 1, and began attending classes under protection of federal officers. A large number of troops in Oxford and vicinity maintained a modified type of martial law for several days, but this force was gradually reduced to approximately 500 by November. By December, Meredith was leading a relatively normal student life, though living in a dormitory under military guard and protected by a small contingent of federal marshals.

Following the activities connected with Meredith's admission, both Barnett and Johnson were found guilty of civil contempt by the Court of Appeals, though sentence was delayed. On November 15 the court ordered their prosecution for criminal contempt. (See also EDUCATION.)

During the early months of the year considerable interest was shown in the investigative activities of the Legislature, particularly those involving the state penitentiary where there were charges of corruption and mismanagement. Four bills designed to effect penitentiary reforms eventually were passed, but all were vetoed by the governor.

The chief political contest was the Democratic primary on June 5 in the new 2d Congressional District, where, because of the state's loss of one House seat, two veteran congressmen, Frank E. Smith and Jamie L. Whitten, ran in opposition. Whitten won by polling about 60 percent of the 57,000 votes cast. At the same election the voters approved a constitutional amendment authorizing the Legislature to separate the office of county sheriff and tax collector.

At the general election on November 6 no Democratic candidates were opposed. A constitutional amendment allowing the Legislature to prescribe additional qualifications for public officers was approved. The voters rejected an amendment which provided for an appointive State Board of Education. Voters also refused to ratify an amendment which would have reapportioned the Legislature by enlarging the Senate to 82 members and the House to 142, with some rearrangement of seats. (See also above, *Legislature, 1962.*)

A world-famed Mississippian, novelist William Faulkner (q.v.), died at Oxford on July 6.

The University of Mississippi.

MISSOURI

A Central state of the United States, Missouri ranks 19th among the states in area (land, 69,138 square miles; inland water, 548) and 13th in population (4,346,000 on July 1, 1962, an 0.6% increase from the 1960 census figure of 4,319,813). Urban places with populations above 15,000 in 1960:

Berkeley	18,676	Kirkwood	29,421
Cape Girardeau	24,947	Overland	22,763
Clayton	15,245	Poplar Bluff	15,926
Columbia	36,650	Raytown	17,083
Ferguson	22,149	Richmond Heights	15,622
Florissant	38,166	St. Charles	21,189
Hannibal	20,028	St. Joseph	79,673
Independence	62,328	St. Louis	750,026
Jefferson City (*capital*)	28,228	Sedalia	23,874
Jennings	19,965	Springfield	95,865
Joplin	38,958	University City	51,249
Kansas City	475,539	Webster Groves	28,990

Government.—Chief executive and judicial officers in 1962 included John M. Dalton (Democrat), governor, serving a four-year term; Hilary A. Bush, lieutenant governor; Warren E. Hearnes, secretary of state; Milton Carpenter, treasurer; Haskell Holman, auditor; Thomas F. Eagleton, attorney general; Hubert Wheeler, superintendent of education; and Laurance M. Hyde, chief justice of the 7-member Supreme Court.

The Missouri General Assembly, which convenes in odd-numbered years, comprised 28 Democrats and 6 Republicans in the Senate in 1962 and 100 Democrats and 57 Republicans in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $607,388,062 included $395,190,646 from state taxes and $195,614,174 in federal funds. Chief tax yields were the 2% general sales tax ($126,719,393) and taxes on individual and corporate incomes ($77,385,347) and motor

fuels ($67,963,097). Spending of $593,638,600 included $165,803,064 for education, $178,724,045 for health, welfare, and safety, and $171,594,066 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 19,969 teachers enrolled 639,000 pupils; secondary schools with 10,866 teachers enrolled 213,000; and parochial schools with 4,628 teachers enrolled 149,901. College enrollment totaled 88,790.

Estimated public school spending in the 1961–62 school year totaled $349,000,000, including current expenditures of $285,380,000 ($386.17 per pupil) and capital outlays of $50 million. Revenue of $375 million was drawn chiefly from state funds ($117,795,000) and local districts ($203,832,000). The state reported teachers' salaries as averaging $5,019 (high school, $5,243; elementary, $4,908). Actual spending for higher education (1961 fiscal year) totaled $44,395,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 246,148 persons totaled $131,132,340. This amount included $79,222,358 for the aged and $29,534,494 for dependent children.

Transportation and Communications.—A total of 1,799 miles of highway construction and reconstruction was completed in the 1960 fiscal year. *Highways and roads* on Jan. 1, 1961, totaled 111,872 miles (101,071 surfaced). These served 1,763,000 *motor vehicles* (as registered in 1960), including 1,415,000 automobiles. Operating in the state were (1962) 37 *railroads* (using, on Jan. 1, 1961, 5,194 line miles of track); (1961) 9 regularly scheduled *airlines;* and 106 commercial and municipal *airports.*

Communications media included (1961) 77 AM and 9 FM *radio stations;* 16 *television stations;* 54 daily *newspapers* (circulation, 1,826,492); and (Jan. 1, 1962) 484,500 business and 1,334,700 residential *telephones.*

Labor Force.—The state's labor force in June 1962 included 255,316 agricultural workers. Nonagricultural employment totaled 1,348,000, compared with 1,333,500 a year earlier and an average of 1,322,600 for the 12 intervening months. Of nonfarm employees, 29% were in manufacturing, 22.6% in trade, and 15% in government services. Unemployment in June 1962 stood at 98,800, compared with 118,700 a year earlier.

Manufacturing.—Manufacturing engaged 391,912 workers in 1960, including 279,659 in production, and provided a payroll of $1,966,805,000. Adjusted value added by manufacture totaled $3,877,863,000.

[1] For definition, see footnote 1 in the article *Industrial Production.*
(Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Missouri ranked 27th among the states in the value of its mineral output, with 0.80% of the national total. It was first in output of lead (54th successive year); second in barite, cobalt, and nickel; and third in lime. Accounting for over half of the total value of $145,365,000 were stone ($36,577,000), lead ($20,350,000), lime ($13,873,000), and coal ($12,567,000).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $706,785,000, compared with $718,233,000 for the corresponding period of 1961. For the full year 1961, income comprised $733,925,000 from livestock, $394,826,000 from crops, and $96,131,000 in government payments. Principal income sources in 1961 were cattle, $286,747,000; hogs, $226,868,000; soybeans, $143,621,000; and wholesale milk, $122,622,000.

The state's 169,000 farms in 1959 had an acreage of 33,153,000 (12,178,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 4,304,000 cattle, 3,932,000 hogs, and 11,013,000 chickens. An average of 232,000 family and 37,000 hired workers engaged in farming in 1961.

MISSOURI CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	933	1,400	1,250
Corn for grain (1,000 bu.)	153,228	182,900	176,204
Cotton lint (1,000 bales)	389	377	465
Cottonseed (1,000 tons)	166	160	198
Hay (1,000 tons)	4,158	4,949	4,286
Peaches (1,000 bu.)	420	500	350
Sorghum grain (1,000 bu.)	10,242	9,776	7,965
Soybeans (1,000 bu.)	37,254	62,448	62,640
Wheat (1,000 bu.)	38,475	41,907	26,352

(Source: U.S. Department of Agriculture.)

Events, 1962.—Gov. John M. Dalton, who in 1961 concentrated attention on the need to attract more industries to Missouri, used his position in 1962 to focus public opinion on the need for expanding higher education facilities in the state. He urged the 1963 legislature to establish branches of the state university in Kansas City and St. Louis, and received backing from a report issued in November by a special legislative interim committee. A gift to the state university of a large warehouse building in St. Louis by J. C. Penney was expected to stimulate action on the governor's recommendations. Additional college facilities were made available when the voters of the city of St. Louis and St. Louis County approved the creation of a public junior college district. The district enrolled its first classes in December.

The 1962 off-year elections again demonstrated the dominance of the Democratic Party in the state. In the most significant contest, U.S. Sen. Edward V. Long, Democrat, defeated Crosby Kemper, his Republican opponent. Only two Republicans (Durward G. Hall of Springfield and Thomas B. Curtis of St. Louis) were successful in the ten congressional district races. In the only contest for a major state office, State Auditor Haskell Holman, Democrat, was easily reelected. Substantial Democratic majorities were returned to both houses of the state legislature.

Dissatisfaction with prices of livestock and grain in the Middle West prompted the National Farmers Organization to mount an effort to keep livestock off the market, beginning September 1. Considerable activity and some violence occurred in Missouri, since the large markets at St. Louis, Kansas City, and St. Joseph were affected.

The state was host to President Kennedy and Secretary of the Interior Stewart L. Udall in August when they visited the site of Oahe Dam in southeastern Missouri (see also DAMS) and the McDonnell Aircraft Corporation, where the Mercury space capsules are produced and where work on the Gemini two-man space vehicle is in progress.

Efforts to make significant changes in Missouri's 17-year-old constitution failed when the voters rejected a proposition to call a constitutional convention to revise the document. Four proposed amendments also were defeated.

MONACO

An enclave in France on the Mediterranean Sea, the Principality of Monaco has an area of 368 acres, and a population (1961 est.) of 22,000, of

whom about 2,500 are citizens. Monaco is ruled by Prince Rainier III (b. 1923; acceded 1949), assisted by an elected 18-member National Council. Government revenue for 1962 was estimated at 80,950,570 francs; expenditure, 80,850,815. The principality is under the protection of France.

Relations between Monaco and France in 1962 were greatly strained over the question of foreign corporations registered in Monaco. France contended that such corporations were in a competitive position which was unfair to companies registered in France, due to the fact that Monaco does not levy income taxes on foreign corporations having headquarters in the principality. France in April renounced several conventions with Monaco relating to postal services, telecommunications, road transport, and banking. In October, France instituted custom checks at the border, an act of harassment that threatened to damage Monaco's economy. Negotiations between the two countries failed to resolve the dispute.

In an apparent effort to rally popular support, Prince Rainier on March 28 restored the constitution which he had suspended in January 1959, and on December 17 he announced a new constitution which granted additional rights to all citizens. A major article of the new constitution stated that it can be suspended or altered only by the approval of both the ruler and the National Council.

MONEY. See Index entry.

MONGOLIAN PEOPLE'S REPUBLIC

The Mongolian People's Republic (Outer Mongolia) is a Communist state situated in east-central Asia, between Soviet Siberia and China. The vast, sparsely populated country has an estimated area of 600,000 square miles. The population of 998,000 (mid-1962 est.) consists chiefly of Khalkhas, with some Mongols, Kazakhs, and other groups. The capital and principal city is Ulan Bator (est. 160,000).

Government.—The republic's third constitution of 1960 provided for a Great People's Khural, or People's Assembly, elected by universal suffrage to a three-year term. In single-list elections on June 19, 1960, 267 government-sponsored delegates were elected to the Assembly, which elects its own 7-member Presidium. The chairman of the Presidium, Zhamsarangin Sambu, is the titular head of the state. A ministry is responsible to the Assembly, and is headed by Premier Yumzhagiyn Tsedenbal, who is also first secretary of the ruling People's Revolutionary Party (Communist).

Soviet influence has been predominant in the country since the 1920's, although Communist China's role in recent years has been important (see below, *Events, 1962*). The Soviet Union has agreed to provide the equivalent of $350 million for Outer Mongolia's five-year economic plan (1961–65), and China has agreed to contribute $50 million. Outer Mongolia was admitted to the United Nations on Oct. 27, 1961.

Education and Religion.—The Communist regime claims that illiteracy has been eliminated. Compulsory schooling for 7 years is planned for all school-age children by the year 1965. School enrollment, 1961: 124,200, including 15,500 secondary students. National Choi-Balsan University at Ulan Bator enrolled 2,500 students in 1959. Buddhism is the principal religion, but the government closely restricts the formerly powerful clerical elements.

Finance.—The state budget for 1961 estimated revenue at 1,222.9 million tughrik; expenditure, 1,217.8 million. The tughrik is officially valued at 4.55 tughrik to the U.S. dollar, and is equivalent in value to the Soviet ruble.

Economy.— Most of the population are nomadic stock raisers who have been organized by the Communist regime into producers' cooperatives and state farms. The country's vast herds of sheep, goats, cattle, and other livestock number about 25 million head. Grain production totaled 256,000 metric tons in 1960, but declined drastically in 1961 because of drought. Under the successive economic plans, some 1.5 million acres of virgin grassland were converted to agricultural production. New industrial plants built since 1960 include a tanning plant, shoe factory, textile plant, flour mill, metalworking plant, cement works, glass factory, printing plant, and electric power generators. Chief manufactures are meat and dairy products, leather goods, sheepskin coats, woolen garments, and felt. Minerals include gold, tungsten, uranium, coal, and petroleum. About 75% of foreign trade is with the Soviet Union; most of the remainder is with Communist China. Chief exports are animal products; imports are mainly equipment and other manufactures.

Transportation.—Railways (totaling 857 miles in 1961) include the important Trans-Mongolian Railway connecting the Trans-Siberian Railroad in the USSR with Peking, China, via Ulan Bator. Motor roads aggregated about 5,350 miles in 1960. A Mongolian and a Soviet airline provide services to the Soviet Union and Communist China.

Events, 1962.—Outer Mongolia's Communist government, which previously had displayed a conciliatory or neutral attitude on questions of difference between the Soviet Union and Communist China, officially approved Soviet ideological policy early in the year. The Central Committee of the Mongolian People's Revolutionary Party ended a four-day meeting on January 29 by adopting a resolution calling for "decisive measures" to abolish all remaining manifestations of the "cult of personality" fostered by the late Mongolian Communist leader Khorloin Choibalsan (1895–1952).

At the same meeting Premier Tsedenbal declared his disagreement with the Chinese Communists for having defended Albania's ideological differences with the Soviet Union. The successful efforts of the Soviet Union in obtaining United Nations membership for Outer Mongolia in 1961 was probably a principal factor in causing the Mongolian Communists to espouse Soviet de-Stalinization and peaceful coexistence policies.

It was announced on June 9, 1962, that Outer Mongolia had joined the Soviet-bloc Council for Mutual Economic Assistance.

A treaty demarcating the previously undefined border between Outer Mongolia and Communist China was signed by Tsedenbal and Premier Chou En-lai in Peking on December 26. The announcement of the new border alignment aroused speculation that Mongolian Communist leaders may be trying to play an intermediary role in the Sino-Soviet ideological conflict, and that Communist China was attempting to influence India to negotiate their own border dispute.

W. R. F.

MONROE, Marilyn

U.S. film star: b. Los Angeles, Calif., June 1, 1926; d. (apparent suicide from an overdose of sleeping pills) Aug. 5, 1962.

She was filmdom's reigning beauty queen—the "sheer sex symbolization" of her time. She was the star of motion pictures that grossed millions and made her the idol of countless fans, both men and women. She was a token of the "rags to riches" American dream. She was also, according to director Joshua Logan, "one of the most unappreciated people in the world."

Marilyn Monroe's life reads like a Hollywood script—pathetic childhood, early professional struggle, lightning-fast success, and inevitable decline. She was born out of wedlock, and variously used her father's surname, Mortenson, and her mother's, Baker. Her original given name was Norma Jean. Most of her childhood was spent in foster homes and, for a time, in an orphanage. (Her mother suffered from mental illness and was frequently confined to institutions.) At 16 she was married to James Dougherty, an aircraft worker, but they soon separated, and were divorced in 1946. She worked as a photographer's model for a while, and had bit parts in several motion pictures. It was not, however, until she appeared in a minor role in *The*

Asphalt Jungle (1950) that her value as a glamorous star was fully realized.

By 1952, after other small roles, notably in *All About Eve* (1950), her public image was firmly established. She subsequently starred in a number of films, including *Gentlemen Prefer Blondes* (1953), *How to Marry a Millionaire* (1953), *The Seven-Year Itch* (1955), *The Prince and the Show Girl* (with Sir Laurence Olivier, 1957), and *Let's Make Love* (with Yves Montand, 1960). Beneath the sensual veneer of her typical "dumb blonde" roles, a certain, if limited, acting talent was discernible. In *Bus Stop* (1956) she showed herself capable of genuine pathos; in *Some Like It Hot* (1959) she proved to be a fine comedienne. In her last-released picture, *The Misfits* (with Clark Gable, 1961), there was evidence that she might develop into an actress of some ability.

Marilyn Monroe's private life was as public as her career. Her later marriages—in 1954 to former baseball player Joe Dimaggio, from whom she was divorced that same year, and in 1956 to playwright

Marilyn Monroe (1926–1962)

WIDE WORLD

Arthur Miller, from whom she was divorced in 1960—were the subject of endless publicity.

After her last divorce it became apparent that the world's most talked-of actress was treading a downhill path. Her chronic lateness and general professional instability were more pronounced. In 1961 she was twice admitted to hospitals for psychiatric observation, and finally was under constant psychiatric care. At last, in 1962, because of continued absences from the studio, she was suspended from the cast of *Something's Got to Give*. According to a team of psychiatrists investigating the star's death, as reported by the *Medical Tribune* (Sept. 17, 1962), she was a long-time sufferer from "psychiatric disturbances," who "experienced severe fears and frequent depressions." Her "probable suicide" (the coroner's verdict) was but one of several attempts to take her own life.

MONTANA

A Northwestern state of the United States, Montana ranks 4th among the states in area (land, 145,736 square miles; inland water, 1,402) and 41st in population (709,000 on July 1, 1962, a 5.1% increase from the 1960 census figure of 674,767). Urban places with populations above 7,500 in 1960:

Anaconda	12,054	Helena (*capital*)	20,227
Billings	52,851	Kalispell	10,151
Bozeman	13,361	Livingston	8,229
Butte	27,877	Miles City	9,665
Great Falls	55,357	Missoula	27,090
Havre	10,740		

Government.—Chief executive and judicial officers in 1962 were Tim M. Babcock (Republican), governor; Frank Murray, secretary of state; Edna J. Hinman, treasurer; E. V. Omholt, auditor; Forrest H. Anderson, attorney general; Harriet Miller, superintendent of public instruction; and James T. Harrison, chief justice of the 5-member Supreme Court. (See also below, *Events, 1962.*)

The Montana Legislative Assembly, which convenes in odd-numbered years, comprised 38 Democrats, 17 Republicans, and 1 Independent in the Senate in 1962 and 54 Republicans and 40 Democrats in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $196,538,419 included $69,709,449 from state taxes and $55,973,951 in federal funds. Chief tax yields were from individual incomes ($13,354,007) and motor fuels ($20,808,949). Spending of $164,602,546 included $40,551,068 for education, $13,343,030 for health, welfare, and safety, and $52,735,173 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 4,800 teachers enrolled 102,500 pupils; public secondary schools with 2,175 teachers enrolled 48,600; and parochial schools with 627 teachers enrolled 18,445. College enrollment totaled 13,869.

Estimated public school spending in the 1961–62 school year totaled $75,025,000, including current expenditures of $61,500,000 ($445 per pupil) and capital outlays of $10,700,000. Revenue of $88,900,000 was drawn chiefly from state funds ($20,500,000) and local districts ($53,000,000). Teachers' salaries averaged $4,760 (high school, $5,360; elementary, $4,490). Actual spending for higher education (1961 fiscal year) amounted to $22,230,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 20,288 persons totaled $10,343,473. This amount included $4,935,759 for the aged and $2,981,567 for dependent children.

Transportation and Communications.—With 392 miles of highway construction and reconstruction completed in 1961, *highways and roads* on Dec. 31, 1961, totaled 75,309 miles (30,140 surfaced). These served 423,881 *motor vehicles* (as registered on Dec. 31, 1961), including 265,537 *automobiles*. Operating in the state were (1961) 9 *railroads* (using 4,940 line miles of track); (1962) 4 regularly scheduled *airlines;* and 113 commercial and municipal *airports*.

Communications media included (1962) 36 AM *radio stations;* 8 VHF *television stations;* (1961) 16 daily *newspapers* (circulation, 169,511); and (Jan. 1, 1962) 72,300 business and 188,300 residential *telephones*.

Labor Force.—In July 1962 there were 176,600 employees in nonagricultural establishments, compared with 175,200 a year earlier and an average of 166,200 during 1961. Of nonfarm workers, 23.2% were in government services, 23.1% in trade, and 14% in service industries. The state paid $11,292,650 in unemployment compensation during 1961.

Manufacturing.—Manufacturing engaged 19,826 workers in 1960, including 15,915 in production, and provided a payroll of $97,250,000. Adjusted value added by manufacture totaled $203,894,000.

In 1960 the two leading industries in the state were lumber and wood products (7,040 workers; $31,855,000 in wages; and $52,810,000 in adjusted value added by manufacture) and petroleum and coal products (1,012; $7,216,000; $28,432,000).

Mining.—In 1961, Montana ranked 24th among the states in the value of its mineral output, with 1.01% of the national total. It was first in output of chromite (sole producer) and vermiculite, second in manganese ore, and third in copper, production of which was the largest since 1944.

MONTANA MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Chromite[1]	82,000	$ 2,939,000
Coal	371,000	1,207,000
Copper (recoverable content of ores)	104,000	62,400,000
Gold (fine ounces)	35,377	1,238,000
Lead (recoverable content of ores)	2,643	544,000
Lime	118,000	986,000
Manganese (35% and over)	17,515	1,412,000
Natural gas (1,000 cu. ft.)	33,901,000	2,509,000
Petroleum, crude (1,000 bbl.)	30,907[2]	74,795,000[2]
Sand and gravel	14,702,000	13,506,000
Silver (fine ounces)	3,490,000	3,227,000
Stone	1,512,000	1,849,000
Zinc (recoverable content of ores)	10,262	2,360,000
Other minerals	...	15,294,000
Total	...	$183,354,000[3]

[1] Excludes quantity consumed by American Chrome Co. [2] Preliminary figure. [3] Total adjusted to eliminate duplication in value of raw materials used in manufacturing cement and lime. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $286,751,000, compared with $238,101,000 for the corresponding period of 1961. For the full year 1961 income comprised $215,215,000 from livestock, $150,079,000 from crops, and $17,041,000 in government payments. Principal income sources in 1961 were cattle, $166,048,000, and wheat, $103,615,000.

MONTANA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Barley (1,000 bu.)	33,338	26,370	54,961
Beans, dry edible (1,000 bags)	197	222	225
Cherries (tons)	1,704	2,570	2,440
Corn for Grain (1,000 bu.)	192	174	200
Flaxseed (1,000 bu.)	347	36	210
Hay (1,000 tons)	2,898	2,528	3,488
Oats (1,000 bu.)	8,452	5,032	10,783
Potatoes (1,000 cwt.)	1,222	1,440	1,248
Rye (1,000 bu.)	262	555	666
Sugar beets (1,000 short tons)	720	893	843
Wheat (1,000 bu.)	91,566	54,048	78,297

(Source: U.S. Department of Agriculture.)

The state's 29,000 farms in 1959 had an acreage of 64,081,000 (8,159,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 2,112,000 cattle, 1,576,000 sheep, and 1,163,000 chickens. An average of 37,000 family and 11,000 hired workers engaged in farming in 1961.

Events, 1962.—The state was shocked on January 25 by the death of Gov. Donald G. Nutter, 46, in an airplane accident near Helena. Five other men lost their lives in the crash, including state Agriculture Commissioner Edward C. Wren. Lt. Gov. Tim M. Babcock succeeded Nutter, who was entering the second year of a four-year term. On May 12, death came also to state Auditor John J. Holmes, who had held the office continuously since 1932.

Politically, the elections of the year produced few changes. Incumbents Arnold Olsen, Democrat, of the 1st District, and James F. Battin, Republican, 2d District, were returned to Congress. A turn-out of 76% of the registered voters returned a Democratic majority to the state Senate, 35 (a decrease of 3) to 21, and a Republican majority of 56 (an increase of 2) to 38 to the House. A constitutional amendment extending the term of county attorneys from two to four years was approved. The election centered chiefly on personalities, but ill-focused issues included: financing a balanced budget; the difficult conditions at the State Training School at Boulder, reportedly caused by conservative appropriations; and federal aid, particularly to water and power development, such as the proposed Knowles Dam on the Flathead River, a tributary of the Clark Fork of the Columbia.

Montreal's Place Ville Marie, climaxed by the 42-story Royal Bank of Canada Building, was finished in September 1962.

DWIGHT E. DOLAN

An uncertain economic climate prevailed in 1962, despite favorable weather conditions and considerable construction activity, including the erection of a $7.5 million ferrochrome plant in Butte, work on the Big Horn Dam (see DAMS), completion of the Minuteman missile sites near Great Falls, expansion of air facilities at Great Falls and Glasgow, and continuation of important state and interstate highway construction.

A prolonged strike in the Butte mining complex contributed to the bankruptcy of Silver Bow County finances. Loans from state agencies covered current payrolls until the county could collect some of its $3.5 million in delinquent taxes, curb welfare expenditures, and trim costs of its hospital for the aged and the Butte Civic Center.

The office of bishop of the Diocese of Helena, left vacant by the death in April of Bishop Joseph M. Gilmore, was filled on August 30 by the consecration of Msgr. Raymond G. Hunthausen, president of Carroll College.

The derailment of a speeding Northern Pacific train on June 10 near Missoula killed 1 person and injured 243 others.

"Events" by: M. G. BURLINGAME,
Professor of History, Montana State College.

MONTREAL

The largest city in Canada, and the world's largest inland port, Montreal is located on the St. Lawrence River in the Province of Quebec. Montreal's population, according to the 1961 census, was 1,191,062, a slight increase from the 1956 census total of 1,109,439. The city is the center of a metropolitan area that increased in total population from 1,745,001 in 1956 to 2,109,509 in 1961. This metropolitan area population growth is concentrated in some 50 suburban municipalities, which now have a total population of more than 900,000.

Approximately 70% of the residents of the city are Canadians whose native language is French. Montreal is the largest French-speaking city in the world after Paris. It supports two English-language daily newspapers and three French language dailies. A fourth French-language daily, which commenced operations in September 1961, ceased publication in the summer of 1962. The city supports four television stations and 10 radio broadcasting stations. Two television and three radio stations conduct their broadcasting schedules entirely in French.

In civic elections, held on October 28, the Civic Party captured 41 of the 45 seats in the City Council. In the previous administration, it held 44 out of 66 seats (reduced to 45 by an amendment to the city charter). Jean Drapeau was returned to another term as mayor by an overwhelming majority. Voters also approved the extension of the term of office of the City Council from two years to four years, and the issuing of identity cards to all citizens eligible to vote.

Like most metropolitan areas in North America, Montreal is confronted with the problem of finding a satisfactory method of coordinating intermunicipal planning and other governmental activities on a metropolitan basis. In 1958 the Montreal Metropolitan Corporation was established with very limited authority. The question of an expanded role for the Metropolitan Corporation became the subject of considerable public debate early in 1962 when the City of Montreal bill was considered by the Provincial Legislature. No action was taken to expand the powers of the corporation, however, and its role in the intermunicipal affairs of the Montreal area remained relatively small.

Construction of a 20.8-mile underground transit system to meet the city's desperate need for adequate mass transportation facilities commenced in the spring of 1962.

The city's skyline underwent a drastic change with the completion of four major projects on Dorchester Boulevard. Of particular interest among

these projects, which were officially opened during the summer of 1962, were the 42-story cruciform-style skyscraper complex known as Place Ville Marie and the 42-story office building of the Canadian Imperial Bank of Commerce.

Pressure for additional university facilities in the city continued. McGill University announced a long-term capital building program to make major additions to its main campus facilities in Montreal, as well as important extensions to its Macdonald College campus near St. Anne de Bellevue. Sir George Williams University, which caters primarily to evening students, also announced plans for a major building expansion program.

Inmates of St. Vincent de Paul Penitentiary rioted on June 17 and set fires causing destruction estimated as high as $3 million. One convict was killed and 30 convicts and guards were injured in the rioting.

Champlain Bridge, Montreal's fourth span over the St. Lawrence River, was opened in July.

MOROCCO

The Kingdom of Morocco is situated in northwestern Africa, with coastlines on both the Atlantic Ocean and the Mediterranean Sea. The area of 171,305 square miles comprises coastal plains and plateaus, the central Atlas Mountains system, and part of the Sahara Desert in the east and south. The population of 11,626,470 (1960 census) consists mainly of Berbers and Arabs, and includes about 400,000 Europeans (mainly French and Spanish) and 200,000 native Jews. Arabic is the official language; French is widely used in commerce, education, and other spheres. Principal cities: Rabat (est. pop., 225,000), the capital; Casablanca (965,277); Marrakech (243,134); Fez (216,000), and Tangier (142,000).

Government.—Morocco attained independence in 1956, after being formerly divided into the French and Spanish protectorate zones and the Tangier International Zone. King Hassan II, who acceded on Feb. 26, 1961, to the throne held by his late father, Mohamed V, appoints the ministry and also serves as premier (since June 2, 1961). There is an advisory National Consultative Assembly, whose 76 members are appointed by the king. A Fundamental Law sealed by the king on June 7, 1961, declared Morocco to be progressing toward a "constitutional monarchy." The only elections which have taken place thus far were those of May 29, 1960, for the local councils of the country's 798 communes.

Education and Religion.—Over three fourths of the population is illiterate. The government has begun a program to expand education on all levels, but only 21% of the school-age population attended school in 1960. School enrollment, 1960: primary, 795,893; secondary, 58,978; technical, 25,973; higher, 4,665. The chief higher institutions are the University of Rabat (3,218 students in 1960) and Qarawiyyin University in Fez (3,500). The majority of Moroccans are Sunni Muslims of the Malikite rite. The Europeans are mostly Roman Catholics under the archbishop of Rabat.

Finance.—Morocco's ordinary budget for 1962 was estimated at DH1,823 million, or 12% above that for 1961 (the dirham has a par value of DH5.06 to the U.S. dollar). Expenditure under the country's third five-year development plan (1961–65) was estimated at DH505.6 million in 1962 (DH451.1 million in 1961). United States economic aid totaled about $40 million in 1961, or nearly half of Morocco's development budget. Foreign exchange holdings: DH1,017 million in October 1961 (DH1,295 million a year earlier).

Transportation and Communications.—Transport networks (miles, 1961): railways, 1,093; surfaced roads, 6,835; other roads, 23,000. Moroccan ports handled 19,015 vessels, aggregating 26.6 million net tons, in 1960. Royal Air Maroc and international airlines operating mainly out of Casablanca flew 2,738,000 route miles in 1960. Other data for 1960: passenger cars, 124,900; commercial vehicles, 47,000; telephones, 128,704; radio receiver licenses, 532,000. Morocco's first television station began operations in early 1962.

Agriculture.—Most of the population is engaged in agriculture and stock raising. In 1960 the government instituted a program to improve the low agricultural productivity by introducing modern farm equipment and techniques, and initiating irrigation and reclamation projects to reclaim unused desert land. The important cereal crop (chiefly wheat, barley, and corn) amounted to only 1.2 million tons in 1961 because of drought (2.6 million tons in 1960). Other agricultural products and estimated 1961 output: grapes, 250,000 metric tons (1961–62); olive oil, 18,000 short tons (1961–62); oranges, 14,220,000 boxes (70 pounds each); flaxseed, 169,000 bushels; leaf tobacco, 5,290,000 pounds; soybean oil, 13,500 metric tons (exported); almonds, 4,000 short tons. Herds of sheep and goats yield meat, wool, hides, and milk products.

Manufactures and Minerals.—In 1960 some 90,000 persons were engaged in manufacturing, which provides less than one fifth of the gross domestic product. Another 45,000 persons were employed in mining; mineral production in 1960 was valued at 82.6 billion French francs. Chief industrial products (metric tons, 1961): iron ore, 1,464,000 (down 7% from 1960); crude petroleum, 800,000 (down 13%); cement, 630,000 (up 8%); manganese ore (Mn content), 174,600 (1960); lead, 24,500 (down 20%); electricity, 1,030 million kw.-hr. (up 4%). Other manufactures include foodstuffs, textiles, chemicals, metallurgical products, footwear, carpets, and leather goods.

Foreign Trade.—Total exports, 1961: DH1,734 million (up 3% from 1960); imports: DH2,288 million (up 8%). Chief exports and values (in million dirhams): phosphates, 411; other raw materials, 824; and foods and beverages, 748. Chief imports are sugar and other foodstuffs, fuels, textiles, machinery, vehicles, and other manufactures. France and other countries in the franc zone took 47% of Morocco's total exports in 1961, and supplied 52% of total imports. Other main trading partners are the United States, West Germany, Great Britain, and Italy.

Events, 1962.—King Hassan II completed his first year as reigning monarch on February 26 after having consolidated his powers as absolute ruler of the kingdom. The young king, in a speech from the throne on March 3, pledged that his government would progress toward a "representative regime" and would nationalize certain vital economic sectors, specifically electric power and railways, while continuing to uphold the principles of democracy, social justice, economic progress, and a policy of nonalignment in foreign affairs. Following criticism by leftist opposition groups to the effect that King Hassan had failed to take significant steps to establish democratic government at the expense of lessening his autocratic powers, the government ordered that a constitutional referendum be held by the end of 1962.

The referendum was held on December 7 and resulted in a victory for King Hassan. The voters largely defied demands by the political opposition to boycott the balloting, and a substantial majority approved the draft constitution that had been prepared by the government. The new constitution establishes a popularly elected Chamber of Deputies, which is to be formed from five to ten months after promulgation of the constitution. It also includes a bill of rights and measures that reinforce the executive authority of the king, who is empowered to submit any bill rejected by the Chamber to a national referendum.

The king paid a private visit to France on May 10–11, and discussed with President Charles de Gaulle possible measures to strengthen cooperation between their two nations. Further negotiations resulted in the economic and cultural agreements of July 7 that provided for French financial assistance (estimated at $70 million) for Morocco's economic development, and for an increase in the number of French technicians and teachers working in the kingdom.

Morocco also concluded similar agreements with Italy, following the visit of Premier Amintore Fanfani to Morocco on January 8–12. At that time King Hassan officially opened the oil refinery at

Mohommedia which had been built with technical and financial help from Italy.

In foreign affairs King Hassan continued to press for Arab unity. He announced on January 23 that a commission of Moroccan and Algerian ministers had been established to create the political structure for a United Arab Maghrib (North Africa). The proposed political union between Morocco and Algeria would also be open to membership for Libya and Tunisia at a later date. Hassan declared that economic union between Algeria and Morocco was a first step, and that the commission would draft a charter for "progressive union on all planes." A treaty of friendship and cooperation was concluded with Libya in early November.

Despite official protestations concerning Arab unity, however, Morocco continued to engage in territorial disputes with neighboring Arab states. In early July, after Algeria had attained independence from France, the Moroccan and Algerian governments exchanged protests over alleged territorial violations by each other's armed forces. Morocco charged that Algerian troops had occupied three Moroccan military outposts in the Sahara, and Algeria protested that Moroccan troops had seized an Algerian outpost in the same region. Neither nation removed their alleged occupying forces from the disputed border areas, and further border clashes occurred late in the year. Algerian rebel troops and refugees who had lived in Morocco during the Algerian rebellion returned to Algeria in the latter half of the year.

Morocco continued to press her claims to independent Mauritania, which the Moroccan government describes as its "southern province." It was reported on April 7 that Moroccans supporting Mauritania's unification with Morocco had attacked a French military post at Nema in southwest Mauritania. In May a Moroccan minister claimed that a "general rebellion" by pro-Moroccan forces had broken out in Mauritania, but the claim was apparently exaggerated and was not confirmed.

Spanish possessions on the Moroccan coast are also claimed by Morocco as an "integral part" of her kingdom, and in May the government initiated economic pressures against the enclaves. Persons working in Morocco were prohibited from living in the Spanish free port of Melilla, and increased efforts were made to stop the smuggling of contraband goods into Morocco from Melilla and Ceuta. Spain reacted to the economic pressure by building up its military defenses in the enclaves. As Spanish troops stationed in the two ports reportedly outnumber the Moroccan 35,000-man army, Morocco was apparently reluctant to attempt to seize the Spanish possessions by the use of force. It was announced on October 28 that the two countries had agreed to negotiate their territorial differences.

Morocco's armed forces were strengthened by further shipments of MIG jet fighters and other military equipment from the Soviet Union. Soviet Deputy Premier Anastas I. Mikoyan, during a visit to Morocco in late January, had discussed with King Hassan new Soviet offers of arms aid and economic assistance for the kingdom.

After the government lifted restrictions on travel by Jews from Morocco, effective as of November 1961, about 7,500 Jews left the country for Marseille, France, by March 1962. Although Morocco, as a member of the Arab League, had previously banned Jewish immigration to Israel, a government official stated that Moroccan Jews had the same travel rights as other Moroccan citizens, but that they would not be allowed to return if they emigrated to Israel.

The economy continued to suffer from the effects of the devastating drought in 1961. The poor crop harvest of that year resulted in a lack of purchasing power that contributed to stagnant economic conditions in the first half of 1962. The lack of new industrial construction was also a factor in keeping the economy relatively dormant. Conditions were improved somewhat by abundant rainfall in March and the resultant improved crop harvest later in the year. Increased imports of grains under the United States aid program had helped to ease serious food shortages, but American aid was reduced by 25% to $30 million for the fiscal year 1962, and the development reportedly caused great concern among Moroccan officials.

Tangier's former status as a free port, which had been ended in 1960, was revived on Feb. 5, 1962, when the city was officially granted "privileged integration" with the kingdom.

MOTION PICTURES

When Hollywood and members of the film industry turned out en masse on Aug. 26, 1962, to honor producer Samuel Goldwyn's 80th birthday, they were reminded that Goldwyn's first movie, *The Squaw Man,* was also the first movie made in Hollywood—in 1913. They realized that Hollywood had come—and gone—a long way since then. The studios, no longer all-powerful, made fewer films and were content to finance and distribute the pictures of independent producers. Hollywood had lost much of its glamor and prestige.

The film makers gave a variety of reasons for the decline: the rise of television; the current trend of producers to make films abroad; the many "sick" movies being turned out about neurotic characters—movies that revolted some viewers but continued to attract large audiences and show profits; the financial insecurity of producers who, when production costs rose, were hesitant to gamble several million dollars on films that might or might not come out ahead at the box offices (some estimates showed that only one out of five films was now profitable); the lack of daring and enthusiasm in producers who were afraid to take a chance and make offbeat movies; and the ridiculously high salaries demanded by stars who insisted on exorbitant compensation as well as profit-sharing contracts.

Major Studios.—Whatever the reasons for a waning Hollywood, some of them were not so much an indication of decline as of change. By 1962, all the major studios (except Twentieth Century-Fox) were headed not by movie makers but by businessmen who were more concerned with quotas, taxes, and balance sheets than with artistic productions. Following the lead of United Artists, the only important company that showed increasing profits for ten consecutive years, the big studios left most of the movie making to independents (those producers, directors, writers, or actors who presided over their own companies and usually made only one film at a time). The major studios then distributed the independent productions with their own.

Twentieth Century-Fox, which was closed for most of 1962 and lost $25 million, elected producer Darryl F. Zanuck as president. Its future

depended mainly on two costly films: *The Longest Day,* the $10 million production about D-Day that was released in October 1962; and *Cleopatra,* the problem-ridden motion picture that had cost $35 million but was still not finished by the end of 1962. It was estimated that *Cleopatra* would have to gross $75 million to show a profit; but the studio hoped that this film could be reissued again and again in future years, like *Gone With the Wind,* which has been reissued four times since its original release in 1939 and has grossed more than $75 million.

"Runaway" Films.—During 1962, the rising costs of American films made abroad (such as *Cleopatra* and the $20 million *Mutiny on the Bounty*) gave producers pause. Samuel Goldwyn, the most famous of the independents (and perhaps the only genuine one, because he financed his own films), has long deplored the trend of American producers to make films abroad in order to take advantage of tax dodges, cheap labor, and foreign subsidies. The unions and guilds also have objected to this trend and have even picketed a few of the "runaway" films. Some of these films were made in foreign countries not to save money, but for authenticity of locale: *Light in the Piazza,* with its beautiful shots of Florence; *Romè Adventure; Tarzan Goes to India;* and *Hatari!,* with its stunning scenes of hunting in Tanganyika.

The unions, having cause to be concerned about the decrease in Hollywood production, granted concessions to producer George Stevens, who consequently started making his $10 million production of *The Greatest Story Ever Told* in the United States instead of abroad as planned. It was hoped this action would set a pattern for other producers. But several of the independents, annoyed at the high costs and inefficiency of foreign production, were already returning to Hollywood's superior technical facilities. The Screen Actors Guild helped the situation by announcing that it would not seek a wage increase for motion picture actors.

Television.—Although there was some increase in unemployment in 1962 in the motion picture industry, many of the craftsmen turned to television for work. Eric Johnston, president of the Motion Picture Association of America, succinctly summed up the association's attitude toward television, once considered a competitor: "We are no longer a feature motion picture industry. We are a television *and* movies industry." Many artists moved back and forth in the two mediums, and some audiences who watched both mediums did not distinguish between them.

During 1962, motion pictures played an increasingly important role on TV programs. All the movie studios, except Universal and Paramount, had sold or leased some of their post-1948 films to TV stations. In New York City alone, 25% of the broadcasting hours were devoted to replays of old movies. Some of these were very mediocre; and the stations were often forced to buy packages of films, taking the bad to get the good. (The U.S. Supreme Court ruled against these package sales on November 5.) Some film makers produced movies expressly for TV, and all film makers, concerned with a possible new source of income, watched the experiments in pay-TV with interest and were willing to supply new movies for pay-TV tests, even before these first-run films were shown in theaters.

Theaters.—It was the motion picture theaters in the United States that were most concerned about the TV competition, and especially the likely success of pay-TV, which would bring first-run films into the home. Would theaters then be able to attract audiences? Although many theaters were torn down or converted into supermarkets or bowling alleys during the past ten years, the total number of theaters in the United States has remained about the same (17,000) since 1948, because drive-ins and new small movie houses replaced the outmoded "palaces." The movie makers, although not entirely content with business as it now stands, are anxious to keep theaters going. Most of the major studios buy foreign films, which they release throughout the United States; and most of them reissue their most popular old movies, some of which do well even though they have appeared on television (*Pride and Prejudice, Anna Karenina, Captains Courageous, Rear Window, Pal Joey, North by Northwest*). The studios, exhibitors, and distributors also launched a radio campaign with the jingle, "Go *out* to a movie tonight." But the most successful scheme to help theaters (and themselves) was the companies' saturation booking: Some new films, instead of opening at a single first-run theater, started in many theaters, suburban as well as city, on the same day. Particularly popular among the saturation bookings were *The Manchurian Candidate,* with Frank Sinatra, and *What Ever Happened to Baby Jane?* with Bette Davis and Joan Crawford.

The 1962 Films.—Exhibitors, always pleased to get whatever assistance they could from the studios to satisfy the 44 million people who attend theaters weekly, were glad that the American companies supplemented their own productions with foreign films. Many of these pictures were popular in the United States. Some had sound tracks in English; some used subtitles to translate the foreign language. Many films were produced internationally, with their directors, actors, writers, staffs, and even financial support coming from various countries. This was especially true of the spectacles, such as *Taras Bulba, Barabbas,* and *Damon and Pythias.*

The spectacular film that won most attention, though not the best reviews, was *The Wonderful World of the Brothers Grimm,* which was the first dramatic picture in Cinerama. Although Cinerama, with its wide, curved screen and three projectors, first appeared in 1952 and has been improved continually since then, critics were disappointed that it still had flaws and that *Grimm* told a pallid story hardly worthy of the elaborate production.

The year saw the release of many dramas with frank, adult themes. Some came from abroad: the French *Jules and Jim, The Girl with Golden Eyes,* and *Sundays and Cybèle;* the Swedish *Through a Glass Darkly;* the Mexican *Viridiana;* the Russian *The Lady with the Dog;* the English *Victim, A Kind of Loving,* and *A Taste of Honey;* the Italian *Boccaccio '70,* and *Divorce—Italian Style;* and the international *A View from the Bridge.* Others were Hollywood films: *The Children's Hour, Something Wild, Lolita, Walk on the Wild Side, Sweet Bird of Youth, The Chapman Report,* and *Two Weeks in Another Town.*

Some of the frank films aroused the censors' ire; and Hollywood has always been concerned when movies attracted attention that might lead to censorship. The Production Code, voluntarily set up by the industry in 1930 and administered rather strictly for 25 years, was revised in 1956 to meet the competition of foreign films that had no restrictions—and to meet the interests of audiences who had tired of pat soap operas. As long as producers handled adult subjects intelligently and without sensationalism, the new freedom met with general approval, but when too many pictures appeared with flashy or lurid themes, Hollywood again feared government interference. Some producers labeled their films with "Adults Only" no-

tices. Some theaters rated the movies they showed. Some states and cities had their own censor boards, whose decisions movie makers often successfully challenged in court (as in the case of *The Connection*). By the year's end, the only conclusion reached was that no one wanted complete government censorship.

Among the other dramas released in 1962, *Requiem for a Heavyweight, Long Day's Journey into Night,* and *To Kill a Mockingbird* won praise. Those that were admired more for their aims than for their success in attaining them included *All Fall Down, Tender Is the Night, Adventures of a Young Man,* and *Five Finger Exercise.*

There was no shortage of films featuring popular comedians, or of flashy, slightly risqué comedies, such as *Jessica, Notorious Landlady, Boys' Night Out,* and *That Touch of Mink;* but there were few family comedies like *Mr. Hobbs Takes a Vacation, Gigot,* and *Bon Voyage.* This last was made by Walt Disney's studio, which also turned out such animal pictures as *Big Red* and *The Legend of Lobo,* and the lively adventure movie, *In Search of the Castaways.* The year's only feature-length cartoon was *Gay Purr-ee,* which disappointed admirers of UPA's fine cartoon shorts. While there were no musical comedies of the outstanding calibre of *West Side Story* (1961), which continued to be popular in 1962, audiences enjoyed *The Music Man, Billy Rose's Jumbo,* and the biographical *Gypsy* (about Gypsy Rose Lee and her mother). Other biographical films included *The Reluctant Saint* (St. Joseph of Cupertino), *The Miracle Worker* (Helen Keller and Annie Sullivan), *The Outsider* (Ira Hamilton Hayes), *Birdman of Alcatraz* (Robert Stroud), *Freud,* and the magnificently photographed *Lawrence of Arabia.*

Most of the year's war films were comedies, such as *The Pigeon That Took Rome* and *The Horizontal Lieutenant,* but a few were thoughtful pictures stressing bravery and the horrors of war: *Hell Is for Heroes, War Hunt, No Man Is an Island, The Counterfeit Traitor,* and *Merrill's Marauders.* The outstanding war film was *The Longest Day.* Sea pictures included the long-awaited and somewhat disappointing remake of *Mutiny on the Bounty; Damn the Defiant;* and the first-rate *Billy Budd.*

Too few films dwelled on timely social themes. *A Majority of One* was a thin racial comedy. *The Intruder, Pressure Point,* and *Flame in the Streets* considered Negro-white conflicts. Politics and ideologies dominated *Advise and Consent* and were mixed with adventure in *The Manchurian Candidate, Guns of Darkness,* and *Escape from East Berlin.*

On the whole, except for the really outstanding films, the 1962 fare of about 200 releases was mediocre. There were the usual Westerns, adventure movies, and mystery thrillers. But there were too few top-notch movies—entirely too few, in fact, to warrant the suggestion made by one producer that a cure for ailing Hollywood should be assistance in the form of government subsidies. Actually the cure for Hollywood and the American movie business is some really good movies.

(See also PRIZES AND AWARDS.)

(Top to Bottom): (1) *The Miracle Worker*, based on the life of Helen Keller, starred Anne Bancroft and Patty Duke. (2) Hardy Kruger and Nicole Courcel in a scene from the French film *Sundays and Cybèle*. (3) Montgomery Clift, seen here with Susannah York, played the title role in *Freud*. (4) In his first motion picture, Peter O'Toole (left) played T. E. Lawrence in *Lawrence of Arabia*. (5) Marcello Mastroiani and Daniela Rocca in the Italian comedy *Divorce, Italian Style*.

UNITED ARTISTS; DAVIS-ROYAL FILMS; UNIVERSAL PICTURES CO., INC.; COLUMBIA PICTURES CORP.; EMBASSY PICTURES CORP.

Motion Pictures of 1962

This selection from the films released in the United States in 1962 represents a cross section of the best, most typical, most popular, and most widely discussed motion pictures produced throughout the world.

Adventures of a Young Man (20th Century-Fox). Producer, Jerry Wald; director, Martin Ritt. From stories by Ernest Hemingway. With Richard Beymer, Arthur Kennedy, Jessica Tandy, Paul Newman, Ricardo Montalban, Eli Wallach, Susan Strasberg.

Advise and Consent (Columbia). Producer-director, Otto Preminger. From the novel by Allen Drury. With Walter Pidgeon, Charles Laughton, Franchot Tone, Don Murray, Henry Fonda, Lew Ayres, Burgess Meredith, Gene Tierney.

All Fall Down (MGM). Producer, John Houseman; director, John Frankenheimer; screenplay by William Inge, from the novel by James Leo Herlihy. With Warren Beatty, Angela Lansbury, Brandon de Wilde, Eva Marie Saint, Karl Malden.

Barabbas (Columbia). Producer, Dino De Laurentiis; director, Richard Fleischer; screenplay by Christopher Fry, from the novel by Pär Lagerkvist. With Anthony Quinn, Vittorio Gassman.

Bell' Antonio (Embassy). Producer, Alfredo Bini; director, Mauro Bolognini. With Marcello Mastroianni, Claudia Cardinale, Pierre Brasseur.

Big Red (Buena Vista). Producer, Walt Disney; director, Norman Tokar. With Walter Pidgeon, Gilles Payant.

Billy Budd (Allied Artists). Producer-director-writer, Peter Ustinov. From the novel by Herman Melville and the play by Robert Chapman and Louis O. Coxe. With Terence Stamp, Peter Ustinov, Robert Ryan.

Billy Rose's Jumbo (MGM). Producer, Joe Pasternak; director, Charles Walters. From the play by Charles MacArthur and Ben Hecht; music and lyrics by Richard Rodgers and Lorenz Hart. With Doris Day, Jimmy Durante, Stephen Boyd, Martha Raye.

Birdman of Alcatraz (United Artists). Producers, Stuart Miller, Guy Trosper; director, John Frankenheimer. With Burt Lancaster.

Boccaccio '70 (Embassy). Producer, Carlo Ponti; directors, Federico Fellini, Luchino Visconti, Vittorio De Sica. With Anita Ekberg, Romy Schneider, Sophia Loren, Peppino De Filippo.

Bon Voyage (Buena Vista). Producer, Walt Disney; director, James Neilson. With Fred MacMurray, Jane Wyman, Michael Callan, Deborah Walley, Tommy Kirk, Kevin Corcoran.

The Cabinet of Caligari (20th Century-Fox). Producer-director, Roger Kay. A remake of the famous 1921 German film. With Glynis Johns, Dan O'Herlihy, Estelle Winwood.

Cape Fear (Universal). Producer, Sy Bartlett; director, J. Lee Thompson. With Gregory Peck, Robert Mitchum, Polly Bergen.

The Chapman Report (Warners). Producer, Richard D. Zanuck; director, George Cukor. From the novel by Irving Wallace. With Efrem Zimbalist, Jr., Shelley Winters, Jane Fonda, Claire Bloom, Glynis Johns.

The Children's Hour (United Artists). Producer-director, William Wyler; screenplay by John Michael Hayes, from the play by Lillian Hellman. With Audrey Hepburn, Shirley MacLaine, James Garner, Miriam Hopkins, Fay Bainter, Karen Balkin.

The Connection (Films Around the World). Producers, Lewis Allen, Shirley Clarke; director, Shirley Clarke; screenplay by Jack Gelber, from his play. With William Redfield, Warren Finnerty, Carl Lee, Jerome Raphel.

The Counterfeit Traitor (Paramount). Producer, William Perlberg; director, George Seaton. With William Holden, Lilli Palmer.

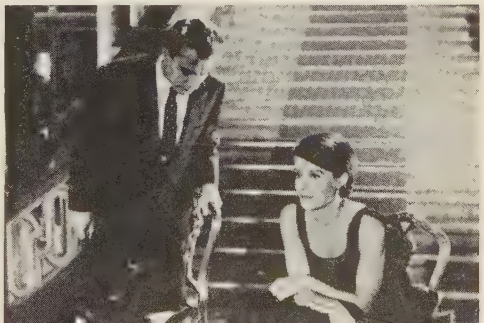
Damn the Defiant! (Columbia). Producer, John Brabourne; director, Lewis Gilbert. With Alec Guinness, Dirk Bogarde, Anthony Quayle.

David and Lisa (Continental). Producer, Paul M. Heller; director, Frank Perry. With Keir Dullea, Janet Margolin, Howard Da Silva.

The Day the Earth Caught Fire (Universal). Producer-director, Val Guest. With Edward Judd, Janet Munro, Arthur Christiansen.

Devi (Harrison). Producer-director-writer, Satyajit Ray. With Sharmila Tagore, Soumitra Chatterjee, Chhabi Biswas.

Divorce—Italian Style (Embassy). Producer, Franco Cristaldi; director, Pietro Germi. With Marcello Mastroianni, Daniela Rocca, Stefania Sandrelli.



(*Top to Bottom*): (1) Jason Robards, Jr., Dean Stockwell, Katharine Hepburn, and Ralph Richardson in the screen version of *Long Day's Journey Into Night*. (2) Robert Preston and Shirley Jones starred in the Hollywood adaptation of *The Music Man*. (3) *A Taste of Honey*, an English film, with Robert Stephens and Rita Tushingham. (4) Allied landing on the coast of France in *The Longest Day*. (5) *Last Year at Marienbad*, with Giorgio Albertazzi and Delphine Seyrig.

EMBASSY PICTURES CORP.; WARNER BROTHERS; CONTINENTAL DISTRIBUTING, INC.; 20TH-CENTURY FOX; ASTOR PICTURES

Eclipse (Times Film). Producers, Robert and Raymond Hakim; director, Michelangelo Antonioni. With Alain Delon, Monica Vitti, Francisco Rabal.

Electra (Lopert). Producer-director, Michael Cacoyannis. From the play by Euripides. With Irene Papas, Yannis Fertis, Aleka Catselli.

Experiment in Terror (Columbia). Producer-director, Blake Edwards. With Glenn Ford, Lee Remick, Ross Martin.

Five Finger Exercise (Columbia). Producer, Frederick Brisson; director, Daniel Mann. From the play by Peter Shaffer. With Rosalind Russell, Jack Hawkins, Maximilian Schell, Richard Beymer, Annette Gorman.

Follow That Dream (United Artists). Producer, David Weisbart; director, Gordon Douglas. With Elvis Presley, Arthur O'Connell, Joanne Moore.

The Four Horsemen of the Apocalypse (MGM). Producer, Julian Blaustein; director, Vincente Minnelli. From the novel by Vicente Blasco Ibáñez. With Charles Boyer, Paul Lukas, Glenn Ford, Ingrid Thulin, Lee J. Cobb, Paul Henreid, Yvette Mimieux, Karl Boehm.

Freud (Universal). Producer, Wolfgang Reinhardt; director, John Huston. With Montgomery Clift, Susannah York, Larry Parks, Susan Kohner, Eileen Herlie, Rosalie Crutchley, Eric Portman.

Gay Purr-ee (Warners). A feature-length animated cartoon produced by UPA; director, Abe Levitow. With the voices of Judy Garland, Robert Goulet, Red Buttons, Hermione Gingold.

Gigot (20th Century-Fox). Producer, Kenneth Hyman; director, Gene Kelly. With Jackie Gleason, Diane Gardner.

Gypsy (Warners). Producer-director, Mervyn LeRoy. From the play by Arthur Laurents; music and lyrics by Jule Styne and Stephen Sondheim. With Rosalind Russell, Natalie Wood, Karl Malden.

Harold Lloyd's World of Comedy (Continental). A compilation of sequences of Harold Lloyd's films from 1923 through 1938.

Hatari! (Paramount). Producer-director, Howard Hawks. With John Wayne, Red Buttons, Elsa Martinelli, Hardy Kruger, Gerard Blain, Michele Girardon, Bruce Cabot.

Hell Is for Heroes (Paramount). Producer, Henry Blanke; director, Don Siegal. With Steve McQueen, Bobby Darin, Fess Parker, Harry Guardino, Bob Newhart.

In Search of the Castaways (Buena Vista). Producer, Walt Disney; director, Robert Stevenson. Based on a story by Jules Verne. With Hayley Mills, Maurice Chevalier, Wilfred Hyde White, George Sanders, Michael Anderson, Jr., Keith Hamshere.

The Interns (Columbia). Producer, Robert Cohn; director, David Swift. With Cliff Robertson, James MacArthur, Michael Callan, Suzy Parker, Nick Adams.

The Intruder (Pathé-America). Producer-director, Roger Corman. With William Shatner, Frank Maxwell, Charles Barnes.

The Island (Zenith). Producers, Kaneto Shindo, Eisaku Matsura; director-writer, Kaneto Shindo. With Taiji Tonoyama, Nobuko Otowa.

It's Only Money (Paramount). Producer, Paul Jones; director, Frank Tashlin. With Jerry Lewis, Zachary Scott, Joan O'Brien.

Joan of the Angels? (Telepix). Producer, Kadr Unit of Film Polski; director, Jerzy Kawalerowicz. With Lucyna Winnicka, Mierczyslaw Voit.

Jules and Jim (Janus). Producer, Les Films du Carosse and S.E.D.I.F.; director, François Truffaut. With Jeanne Moreau, Oskar Werner, Henri Serre.

A Kind of Loving (Governor). Producer, Joseph Janni; director, John Schlesinger. With Alan Bates, June Ritchie, Thora Hird.

The Lady with the Dog (Artkino). Producer-director-writer, Josef Heifitz. From the story by Anton Chekhov. With Iya Savvina, Alexei Batalov.

Last Year at Marienbad (Astor). Director, Alain Resnais; screenplay by Alain Robbe-Grillet. With Delphine Seyrig, Giorgio Albertazzi, Sacha Pitoeff.

Lawrence of Arabia (Columbia). Producer, Sam Spiegel; director, David Lean; screenplay by Robert Bolt. With Peter O'Toole, Alec Guinness, Anthony Quinn, Jack Hawkins, Omar Sharif, Jose Ferrer, Arthur Kennedy, Anthony Quayle.

Light in the Piazza (MGM). Producer, Arthur Freed; director, Guy Green; screenplay by Julius J. Epstein, from the novel by Elizabeth Spencer. With Olivia de Havilland, Rossano Brazzi, Yvette Mimieux, George Hamilton.

Lolita (MGM). Producer, James B. Harris; director, Stanley Kubrick; screenplay by Vladimir Nabokov, from his novel. With James Mason, Shelley Winters, Sue Lyon, Peter Sellers.

The Loneliness of the Long Distance Runner (Continental). Producer-director, Tony Richardson; screenplay by Alan Sillitoe, from his story. With Michael Redgrave, Tom Courtenay, James Bolam, Topsy Jane.

Lonely Are the Brave (Universal). Producer, Edward Lewis; director, David Miller. With Kirk Douglas, Walter Matthau, Gena Rowlands.

The Long Absence (Commercial). Presented by Robert and Raymond Hakim; directed by Henri Colpi; screenplay by Marguerite Duras. With Alida Valli, Georges Wilson.

Long Day's Journey into Night (Embassy). Producer, Ely Landau; director, Sidney Lumet. From the play by Eugene O'Neill. With Katharine Hepburn, Ralph Richardson, Jason Robards, Jr., Dean Stockwell.

The Longest Day (20th Century-Fox). Producer, Darryl F. Zanuck; directors, Ken Annakin, Andrew Marton, Bernhard Wicki. With John Wayne, Robert Mitchum, Red Buttons, Richard Beymer, Robert Ryan, Henry Fonda, Jeffrey Hunter, Stuart Whitman, Richard Burton, Kenneth More, Curt Jurgens, Peter Van Eyck.

Lover, Come Back (Universal). Producers, Stanley Shapiro, Martin Melcher; director, Delbert Mann. With Rock Hudson, Doris Day, Tony Randall.

The Lovers of Teruel (Continental). Director-writer, Raymond Rouleau. With Ludmila Tcherina.

A Majority of One (Warners). Producer-director, Mervyn LeRoy; screenplay by Leonard Spigelgass, from his play. With Rosalind Russell, Alec Guinness, Ray Danton, Madlyn Rhue.

The Manchurian Candidate (United Artists). Producers, George Axelrod, John Frankenheimer; director, John Frankenheimer; screenplay by George Axelrod, from the novel by Richard Condon. With Frank Sinatra, Laurence Harvey, Janet Leigh, Angela Lansbury, James Gregory.

The Man Who Shot Liberty Valance (Paramount). Producer, Willis Goldbeck; director, John Ford. With John Wayne, James Stewart, Vera Miles, Lee Marvin.

Merrill's Marauders (Warners). Producer, Milton Sperling; director, Samuel Fuller. With Jeff Chandler, Ty Hardin.

The Miracle Worker (United Artists). Producer, Fred Coe; director, Arthur Penn; screenplay by William Gibson, from his play. With Anne Bancroft, Patty Duke.

Mr. Hobbs Takes a Vacation (20th Century-Fox). Producer, Jerry Wald; director, Henry Koster. With James Stewart, Maureen O'Hara, Fabian.

Murder, She Said (MGM). Producer, George N. Brown; director, George Pollock. With Margaret Rutherford, Arthur Kennedy, Muriel Pavlow.

The Music Man (Warners). Producer-director, Morton DaCosta; screenplay by Marion Hargrove, based on Meredith Willson's musical comedy. With Robert Preston, Shirley Jones.

Mutiny on the Bounty (MGM). Producer, Aaron Rosenberg; director, Lewis Milestone. Based on the novel by Charles Nordhoff and James Norman Hall. With Marlon Brando, Trevor Howard.

The Night (Lopert). Producer, Emanuele Cassuto; director, Michelangelo Antonioni. With Jeanne Moreau, Marcello Mastroianni, Monica Vitti.

No Exit (Zenith). Producers, Fernando Ayala, Hector Olivera; director, Tad Danielewski; screenplay by George Tabori, from the play by Jean-Paul Sartre. With Viveca Lindfors, Rita Gam, Morgan Sterne, Ben Piazza.

The Notorious Landlady (Columbia). Producer, Fred Kohlmar; director, Richard Quine. With Kim Novak, Jack Lemmon, Fred Astaire, Lionel Jeffries.

The Outsider (Universal). Producer, Sy Bartlett; director, Delbert Mann. With Tony Curtis, James Franciscus.

Period of Adjustment (MGM). Producer, Lawrence Weingarten; director, George Roy Hill; screenplay by Isobel Lennart, from the play by Tennessee Williams. With Tony Franciosa, Jane Fonda, Jim Hutton, Lois Nettleton.

Phaedra (Lopert). Producer-director, Jules Dassin. With Melina Mercouri, Raf Vallone, Anthony Perkins.

The Pigeon That Took Rome (Paramount). Producer-director-writer, Melville Shavelson. With Charlton Heston, Elsa Martinelli, Harry Guardino, Baccaloni.

Pressure Point (United Artists). Producer, Stanley Kramer; director, Hubert Cornfield. With Sidney Poitier, Bobby Darin, Peter Falk.

The Quare Fellow (Astor). Producer, Anthony Havelock-Allan; director-writer, Arthur Dreifuss. Based on the play by Brendan Behan. With Patrick McGoohan, Sylvia Syms.

Requiem for a Heavyweight (Columbia). Producer, David Susskind; director, Ralph Nelson; screenplay by Rod Serling, from his television play. With Anthony Quinn, Jackie Gleason, Mickey Rooney, Julie Harris.

Road to Hong Kong (United Artists). Producer, Melvin Frank; director, Norman Panama. With Bing Crosby, Bob Hope, Joan Collins, Dorothy Lamour, Peter Sellers.

Rome Adventure (Warners). Producer-director-writer, Delmer Daves. With Troy Donahue, Angie Dickinson, Rossano Brazzi, Suzanne Pleshette.

Secrets of the Nazi Criminals (Trans-Lux). Producer-director-editor, Tore Sjoberg. A documentary made up of film clips on the Nazi regime.

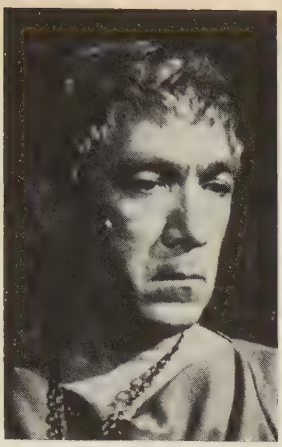
Sergeants Three (United Artists). Producer, Frank Sinatra; director, John Sturges. With Frank Sinatra, Dean Martin, Peter Lawford, Sammy Davis, Jr., Joey Bishop.

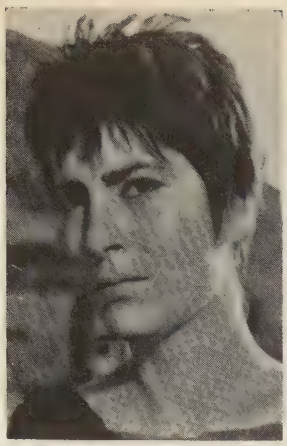
Shoot the Piano Player (Astor). Producer, Pierre Braunberger; director-writer, François Truffaut. With Charles Aznavour, Marie Du Bois, Nicole Berger.

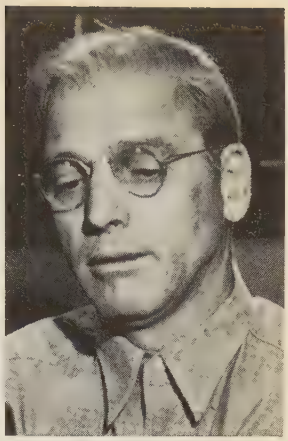
The Sky Above—the Mud Below (Embassy). Producers, Arthur Cohn, Rene Lafuite; director-writer, Pierre-Dominique Gaisseau. Documentary film made during a French-Dutch expedition in former Netherlands New Guinea.

The Spiral Road (Universal). Producer, Robert Arthur; director, Robert Mulligan. Based on the novel by Jan de Hartog. With Rock Hudson, Burl Ives, Gena Rowland.

State Fair (20th Century-Fox). Producer, Charles Brackett; director, Jose Ferrer; screenplay by Richard Breen, from







Three memorable performances of 1962 (*l.* to *r.*): Anthony Quinn in *Barabbas;* Irene Papas in *Electra;* and Burt Lancaster in *Bird Man of Alcatraz.*

COLUMBIA PICTURES; LOPERT PICTURES CORP.; UNITED ARTISTS

the novel by Philip Stong; music and lyrics by Richard Rodgers and Oscar Hammerstein, 2d. With Pat Boone, Bobby Darin, Pamela Tiffin, Ann-Margret, Tom Ewell, Alice Faye, Wally Cox.

Stowaway in the Sky (Lopert). Director-writer, Albert Lamorisse; narration by S. N. Behrman, spoken by Jack Lemmon. With Pascal Lamorisse, André Gille, Maurice Baquet.

Sundays and Cybèle (David-Royal). Producer, Romain Pines; director-writer, Serge Bourguignon. With Hardy Kruger, Nicole Courcel, Patricia Gozzi.

Sweet Bird of Youth (MGM). Producer, Pandro S. Berman; director-writer, Richard Brooks, from the play by Tennessee Williams. With Geraldine Page, Paul Newman, Shirley Knight, Ed Begley, Rip Torn.

Taras Bulba (United Artists). Producer, Harold Hecht; director, J. Lee Thompson. Based on the novel by Nikolai Gogol. With Yul Brynner, Tony Curtis, Christine Kaufmann.

Tarzan Goes to India (MGM). Producer, Sy Weintraub; director, John Guillermin. Based on characters created by Edgar Rice Burroughs. With Jock Mahoney, Mark Dana, Simi.

A Taste of Honey (Continental). Producer-director, Tony Richardson. Based on the play by Shelagh Delaney. With Rita Tushingham, Dora Bryan, Murray Melvin, Paul Danquah.

Tender Is the Night (20th Century-Fox). Producer, Henry T. Weinstein; director, Henry King. Based on the novel by F. Scott Fitzgerald. With Jennifer Jones, Jason Robards, Jr., Joan Fontaine, Tom Ewell.

That Touch of Mink (Universal). Producers, Stanley Shapiro, Martin Melcher; director, Delbert Mann. With Cary Grant, Doris Day, Gig Young, Audrey Meadows.

Through a Glass Darkly (Janus). Producer, Svensk Filmindustri; director-writer, Ingmar Bergman. With Harriet Andersson, Gunnar Björnstrand, Max von Sydow, Lars Passgård.

To Kill a Mockingbird (Universal). Producer, Alan J. Pakula; director, Robert Mulligan; screenplay by Horton Foote, from the novel by Harper Lee. With Gregory Peck, Mary Badham, Phillip Alford, Brock Peters, Collin Wilcox.

Tomorrow Is My Turn (Showcorporation). Director, André Cayatte. With Charles Aznavour, Nicole Courcel, Georges Rivière, Cordula Trantow.

Two for the Seesaw (United Artists). Producer, Walter Mirisch; director, Robert Wise; screenplay by Isobel Lennart, from the play by William Gibson. With Robert Mitchum, Shirley MacLaine.

Two Weeks in Another Town (MGM). Producer, John Houseman; director, Vincente Minnelli; screenplay by Charles Schnee, from the novel by Irwin Shaw. With Kirk Douglas, Edward G. Robinson, Cyd Charisse, George Hamilton, Dahlia Lavi, Claire Trevor.

A Very Private Affair (MGM). Producer, Christine Gouze-Renal; director, Louis Malle. With Brigitte Bardot, Marcello Mastroianni.

Victim (Pathé-America). Producer, Michael Relph; director, Basil Dearden. With Dirk Bogarde, Sylvia Syms, Dennis Price.

A View from the Bridge (Continental). Producer, Paul Graetz; director, Sidney Lumet. Based on the play by Arthur Miller. With Raf Vallone, Maureen Stapleton, Carol Lawrence, Jean Sorel, Raymond Pellegrin.

Viridiana (Kingsley International). Producer, Gustavo Alatriste; director-writer, Luis Buñuel. With Fernando Rey, Silvia Pinal, Francisco Rabal.

Walk on the Wild Side (Columbia). Producer, Charles K. Feldman; director, Edward Dmytryk. Based on the novel by Nelson Algren. With Laurence Harvey, Capucine, Barbara Stanwyck, Anne Baxter, Jane Fonda.

Waltz of the Toreadors (Continental). Producer, Peter De Sarigny; director, John Guillermin; screenplay by Wolf Mankowitz, from the Jean Anouilh play. With Peter Sellers, Margaret Leighton, Dany Robin, Cyril Cusak.

War Hunt (United Artists). Producer, Terry Sanders; director, Denis Sanders. With John Saxon, Robert Redford.

What Ever Happened to Baby Jane? (Warners). Producer-director, Robert Aldrich. With Bette Davis, Joan Crawford, Victor Buono.

Whistle Down the Wind (Pathé-America). Producer, Richard Attenborough; director, Bryan Forbes. With Hayley Mills, Alan Bates, Bernard Lee, Alan Barnes.

The Wonderful World of the Brothers Grimm (MGM). Producer, George Pal; directors, Henry Levin, George Pal. With Laurence Harvey, Karl Boehm, Claire Bloom, Walter Slezak, Russ Tamblyn, Yvette Mimieux, Buddy Hackett, Terry-Thomas.

Yojimbo (Seneca International). Producer-director, Akira Kurosawa. With Toshiro Mifune, Takashi Shimura, Isuzu Yamada.

MOTOR TRANSPORTATION

Motor freight carriers under Interstate Commerce Commission (ICC) regulation registered a recovery of volume and earnings during 1962, following a depressed period in early 1961. Travel on intercity bus lines and in school-bus service increased, while local and suburban bus patronage was steady or slightly declining.

Trucking.—Gross operating revenues for the 16,000 ICC regulated trucking companies reached an estimated $7.9 billion during 1962, or nearly as much as the annual freight revenues of all United States railroads. Additional billions of dollars' worth of service was generated by private and for-hire trucking operations not reporting to the ICC.

Motor freight carriers grossing at least $200,000 annually reported for the first half of 1962 that revenues rose about 12% and tonnage handled rose 10% from the corresponding period of 1961. The recovery of volume was accompanied by improved net earnings. Tonnage surveys conducted by the American Trucking Associations indicated that the volume handled during the second half of 1962 by general freight carriers, which represent about half of the regulated industry, would be a few percentage points ahead of 1961.

Truck registrations reached a record 12 million vehicles, not including government-owned trucks, during 1962. These trucks used about 16 billion gallons of fuel and provided employment for about 7,500,000 persons.

Bus Operations.—There were about 280,000 buses in the United States in 1961, according to registration reports of the U.S. Bureau of Public Roads, and this total was probably increased by 5,000 or more in 1962, largely as a result of further increases in numbers of school buses. More than 20,000 buses were engaged in intercity service, and nearly 50,000 in local and suburban transit service, according to the National Association of Motor Bus Owners and the American Transit Association. The school-bus fleet, as reported by the Office of Edu-

cation of the U.S. Department of Health, Education, and Welfare, consisted of roughly 170,000 buses in 1961, not including about 20,000 station wagons and other small-capacity vehicles used for pupil transportation.

Intercity bus travel in 1962 was expected to total about 22 billion passenger miles, nearly 10% more than the level of several preceding years. Long-distance through-bus service, chartered-bus travel, and express-package transportation continued to increase.

Local and suburban bus lines provided somewhat less than 5 billion rides for revenue passengers in 1962. School vehicles, such as buses and station wagons, carried 13.7 million pupils daily at public expense during the 1961–62 school year, according to estimates of the U.S. Office of Education, or about a half-million more than in 1960–61.

MUENCH, Aloisius Joseph

U.S. cardinal: b. Milwaukee, Wis., Feb. 18, 1889; d. Rome, Italy, Feb. 15, 1962.

At the time of his death he was one of six cardinals from the United States and, as an advisory member of the Sacred Congregations of Religious, of Rites, and for Extraordinary Ecclesiastical Affairs, the only American ever to serve on the Roman Curia, the governing body of the Roman Catholic Church. (In 1958, Samuel Cardinal Stritch, archbishop of Chicago, was assigned to the Curia, but died that year before assuming his duties.) From 1951, prior to his elevation to the Sacred College in 1959, Cardinal Muench was apostolic nuncio to Germany.

Following studies at the Seminary of St. Francis de Sales in Milwaukee, he was ordained a priest in 1913 and became curate of a parish church in Milwaukee. In 1917 he was assigned to the same post at St. Paul's Chapel at the University of Wisconsin, from which he received his master's degree in economics in 1919. He then went to Europe to study, and was granted a doctorate in social science from the University of Fribourg in 1921. In 1922, after further graduate work, he returned to the United States, first as professor and then as rector (1929) of the Seminary of St. Francis de Sales. He was named papal domestic prelate, with the rank of monsignor, in 1934, and a year later, bishop of Fargo, N.Dak.

Cardinal Muench's long official association with Germany began in 1946 when he was given the duty of liaison officer between the German Roman Catholic hierarchy and the United States occupation authorities. In that year he was also appointed apostolic visitor to Germany and head of the Papal Relief Commission. In 1949 he became regent of the apostolic nunciature in Germany, and in 1951, after his elevation to archbishop in 1950, he was named papal nuncio.

MUSCAT AND OMAN

The sultanate of Muscat and Oman occupies a wide rim along the southeastern coast of the Arabian Peninsula. Its area is about 82,000 square miles, and its population is estimated at 650,000. The capital is Muscat (est. pop., 5,500), but the main market town is Matrah (est. pop. 8,500), three miles to the north. The province of Dhofar is joined to the state only by personal bond with the sultan.

Government.—Sa'id ibn Taymur ibn Faysal (acceded in 1932) governs the sultanate, which has been recognized by the United States, Great Britain, and India, among other countries. Foreign affairs are conducted through British embassies and agents as a courtesy but not as a treaty right. The sultan exercises autocratic internal authority.

Economy.—Since 1939 the Indian rupee has been the official basis of exchange; however, the Maria Theresa thaler is still widely used in the interior. The economy is based on agriculture and fishing, and the country is mostly undeveloped. Dates, pomegranates, limes, and fish are the chief exports; they are sold mainly to Pakistan, India, and Ceylon. The bulk of the imports are foodstuffs. Petroleum Development (Oman) Ltd. holds the petroleum concession, except for the province of Dhofar, where Cities Service Corporation has the rights. No major fields have yet been proved, but prospects are considered good. Since 1961 Great Britain has helped in improving the main harbor and in building modern roads.

Events, 1962.—The Buraimi Oasis is composed of nine small oases, three of which are claimed by the sultan and the other six by the Trucial States sheikhdom of Abu Dhabi. These claims are supported by Great Britain, but Saudi Arabia, backed by American oil companies, especially the Arabian American Oil Company, claims the entire Buraimi Oasis. Troops from the Trucial States led by British officers occupy Buraimi. With the discovery of vast reserves of oil by British companies in Abu Dhabi, Great Britain will not end her support of the sheikhdom lightly. American oil interests, likewise, will not abandon the Saudi Arabian cause without great pressure. No progress in the matter was noted in 1962.

A dispute over Oman arose in 1953 when Ghalib ibn Ali was elected imam of Oman, under terms of the 1920 Treaty of Sib but over the opposition of the sultan of Muscat and Oman. The imam declared the interior areas of Oman independent of the sultan; armed clashes occurred and the imam fled in 1959 to Saudi Arabia and was received openly in most Arab countries as the rightful ruler of Oman. Late in 1961, the Special Political Committee of the UN General Assembly debated the Omani dispute. Saudi Arabia claimed that the British had attacked Omani forces, imposed curfews, conducted mass arrests, and flown in reinforcements to Muscat. This was denied by the sultan's adviser, and the British accused Iraq, Saudi Arabia, and the United Arab Republic of wanton support of Oman independence. With many absences and abstentions, the committee voted to endorse the Omani campaign for independence.

On July 11, 1962, all members of the Arab League except Kuwait asked the United Nations to debate the future of Oman, calling for "withdrawal of foreign forces from Oman" and again accusing Britain of armed aggression. A resolution requesting independence for the sultanate and again demanding that foreign forces evacuate Oman was approved by the General Assembly's Special Political Committee on November 28. The resolution failed to receive the necessary two-thirds majority for approval when the General Assembly voted on the proposal on December 11.

MUSIC

(This article is concerned chiefly with developments related to the concert and operatic stages, and to new music. For information on the year's activities in recorded music, see RECORDINGS; for music of the legitimate theater and ballet, see THEATER and DANCE, respectively; and for additional information on music in broadcasting, see RADIO AND TELEVISION.)

Because Igor Stravinsky, whom many critics regard as the only living composer of the first rank, celebrated his 80th birthday on June 17, 1962, this was the Stravinsky year throughout the musical world. On Jan. 18, 1962, President and Mrs. John F. Kennedy gave a dinner for the composer and his wife at the White House. On the next day, the Opera Society of Washington presented the composer conducting his opera-oratorio *Œdipus Rex* (on a double bill shared with Maurice Ravel's *L'heure espagnole*). During the rest of 1962, Stravinsky was honored with performances everywhere.

On June 14, 1962, the CBS-TV network televised the world premiere of Stravinsky's ballet-cantata *Noah and the Flood*, sending out a one-hour program marred by lapses in taste and destructive interruptions by commercials. Another new Stravinsky piece, the cantata entitled *A Sermon, a Narrative and a Prayer*, was performed for the first time by the Basel (Switzerland) Chamber Orchestra and Chorus conducted by Paul Sacher, who had commissioned it and to whom it is dedicated. At Santa Fe, N.Mex., the 1962 summer opera season began with a torrid performance of Richard Strauss' *Salome*, but was built about a tribute to the octogenarian Stravinsky. His *Mavra*, *Renard*, and *Le Rossignol* formed one triple bill; a double bill was devoted to his *Œdipus Rex* and *Perséphone;* his only English opera, *The Rake's Progress*, also was performed. The San Francisco Opera Company and the American Opera Society, New York, both announced that their seasons also would include *The Rake's Progress*. In August 1962, Stravinsky set out on an international tour during which he visited his Russian homeland for the first time in more than 40 years, conducting performances of his own music, which had been under a ban there until very recently.

Recording companies poured out new albums of Stravinsky compositions, many of them conducted by the composer, thus adding to the glut on the record market. (The *Schwann Long Playing Record Catalog* added listings of 1,807 new albums during 1961, while deleting only 1,683 discontinued albums; whereas its February 1961 issue had contained 28,442 items, that number had grown by the February 1962 issue to 30,327.)

The musical world signalized other anniversaries during the 1961–62 season: centenaries of the births of Claude Debussy and Frederick Delius; the 80th birthdays of Gian Francesco Malipiero and Zoltán Kodály; the 75th birthdays of the composer Ernst Toch, the tenor Roland Hayes, and the pianist Artur Rubinstein (who gave ten recitals at Carnegie Hall, New York, between Oct. 30 and Dec. 10, 1961); the 65th birthdays of the American composers Henry Cowell, Virgil Thomson, and Howard Hanson (whose retirement, after 40 years, as director of the Eastman School of Music, Rochester, N.Y., was announced for June 1964). The Israel Philharmonic Orchestra and the Louisville (Ky.) Orchestra celebrated 25th anniversaries, the San Francisco Symphony its 50th.

Orchestras.—In Chicago, it was announced that Jean Martinon would succeed Fritz Reiner as music director of the Symphony at the opening of the 1963–64 season. In New York, William Schuman followed Gen. Maxwell D. Taylor as president of the Lincoln Center for the Performing Arts, and it was announced that Peter Mennin was resigning his position as director of the Peabody Conservatory (Baltimore) to succeed Schuman as president of the Juilliard School of Music. Charles Munch served his last year as conductor of the Boston Symphony Orchestra; at the opening of the 1962–63 season he was succeeded by Erich Leinsdorf. In an atmosphere of bitter controversy, Enrique Jorda resigned as conductor of the San Francisco Symphony in May 1962; he is to be succeeded in November 1963 by Josef Krips, conductor since 1954 of the Buffalo (N.Y.) Philharmonic Orchestra. Zubin Mehta was scheduled to be the new conductor of the Los Angeles Philharmonic. The new American Symphony Orchestra, with Leopold Stokowski as conductor, made its debut at Carnegie Hall, New York, on Oct. 15, 1962. After an absence of nearly two decades, Otto Klemperer returned to New York, conducting the Philadelphia Orchestra at Carnegie Hall on Oct. 23, 1962, and at the new Philharmonic Hall on Nov. 6 and 20.

The 1961–62 season of the New York Philharmonic was enlivened by a controversy set off at its concert of April 8, 1962, when the conductor, Leonard Bernstein, told the audience that he assumed no responsibility for the interpretation of the Brahms Piano Concerto No. 1 which it was about to hear, and made clear that the interpretation was that of the soloist, Glenn Gould. The Philharmonic presented its final Carnegie Hall concert on May 20, 1962, and opened the new Philharmonic Hall at Lincoln Center with a gala concert (which was televised nationally) on September 23. This performance initiated a week of benefit concerts during which the Boston, Cleveland, and Philadelphia orchestras also were heard, as were the duo pianists Arthur Fizdale and Robert Gold and a Metropolitan Opera group. The last named, under the baton of Ernest Ansermet, gave the United States premiere of Manuel de Falla's posthumous dramatic cantata *Atlàntida*, so drastically abbreviated as to arouse a newspaper controversy.

Opera.—The Metropolitan Opera opened its 1961–62 season on Oct. 23, 1961, with Puccini's *La fanciulla del West*, but greater interest was generated on November 26, when the Australian soprano Joan Sutherland made her Metropolitan debut in the title role of Donizetti's *Lucia di Lammermoor*. The company's season generally was regarded as a poor one, though it was marked by a new staging of Verdi's *Un ballo in maschera* and by interesting Metropolitan debuts by one tenor (George Shirley) and five sopranos (Phyllis Curtin, Gerda Lammers, Judith Raskin, Teresa Stich-Randall, and Galina Vishnevskaya). End-of-season statistics showed that no opera by a living composer or by an American had been presented; that Verdi's *La Traviata*, Puccini's *Tosca*, and Verdi's *Aida*—in that order—had been sung more often than any other operas; and that the composers heard most were Verdi (56 performances of 6 operas), Puccini (45 of 5), Wagner (21 of 5), Donizetti (16 of 2), Mozart (14 of 2), Offenbach (14 of 2), and Richard Strauss (9 of 2).

The Metropolitan opened its 1962–63 season

In Red Square in Moscow, during a tour of the Soviet Union with his jazz band, Benny Goodman performs alone on June 1.

UPI

on Oct. 15, 1962, with a restaged version of Umberto Giordano's opera *Andrea Chénier,* with Eileen Farrell, Franco Corelli, and Robert Merrill in leading roles. Five other new productions were announced for the season: Bellini's *La Sonnambula* (for Joan Sutherland); Verdi's *Otello;* Wagner's *Die Meistersinger;* Francesco Cilèa's *Adriana Lecouvreur,* for the first time since 1908 (for Renata Tebaldi); and one opera never before staged at the Metropolitan, Richard Strauss' *Ariadne auf Naxos.* Important Metropolitan debuts scheduled included those of the conductors Ernest Ansermet and Lorin Maazel (aged 78 and 32, respectively), that of the French soprano Régine Crespin, and that of the Belgian mezzo-soprano Rita Gorr, who was applauded enthusiastically for her *Aida* Amneris on October 17. Construction of the new Metropolitan Opera House at the Lincoln Center had not yet been started; the uncertain date for its possible inauguration receded farther and farther into the future.

The New York City Opera began its fall 1961 season on October 5 with one of the rare integral performances of Puccini's *Il Trittico,* a triptych of one-act operas (*Il Tabarro, Suor Angelica, Gianni Schicchi*), and presented the premieres of two American operas produced (like *The Harvest* in Chicago and *Blood Moon* in San Francisco) under Ford Foundation sponsorship: Douglas Moore's *The Wings of the Dove* (October 12), with a libretto based on the Henry James novel, and Robert Ward's *The Crucible* (October 26), with a libretto based on Arthur Miller's play. During a spring 1962 season of contemporary opera in English, the company gave the premiere of another Ford Foundation-sponsored opera, Abraham Ellstein's very unsuccessful *The Golem,* as well as performances of Benjamin Britten's *The Turn of the Screw,* its libretto after the Henry James story. The company inaugurated its fall 1962 season on October 4 with a revival of Gustave Charpentier's *Louise;* on October 11, it presented the premiere of its fourth Ford Foundation opera, Carlisle Floyd's *The Passion of Jonathan Wade.*

The Chicago Lyric Opera opened its season on Oct. 14, 1961, with a Joan Sutherland *Lucia di Lammermoor,* later offering a disappointing premiere, that of Vittorio Giannini's *The Harvest.* For its 1962 fall season, the company billed Borodin's *Prince Igor,* with Boris Christoff singing two roles; Saint-Saëns' *Samson et Dalila* (for Giulietta Simionato); and revivals of Puccini's *La Bohème* and *Tosca* (both for Renata Tebaldi), as well as of Verdi's *Rigoletto,* Mozart's *Le nozze di Figaro,* and Donizetti's *L'elisir d'amore.*

The San Francisco Opera—after a 1961–62 season that included the United States debut of Ilva Ligabue in Boito's *Mefistofele* (Oct. 21, 1961), the United States premiere of Benjamin Britten's *A Midsummer Night's Dream* (October 10), and the premiere of Norman Dello Joio's *Blood Moon* (September 18)—announced a 1962–63 season highlighted by two 20th-century operas, Stravinsky's *The Rake's Progress* and Alban Berg's *Wozzeck.*

In Dallas, the Civic Opera season (Nov. 30 to Dec. 15, 1962) was to consist of Verdi's *Otello,* Rossini's *Il barbiere di Siviglia,* Puccini's *Suor Angelica,* and Leoncavallo's *Pagliacci,* unadventurous fare for a company that in six years has presented Rossini's *L'Italiana in Algeri,* Cherubini's *Medea* (with Maria Callas), Handel's *Alcina* (with Joan Sutherland), and Massenet's *Thaïs.*

Concert performances of opera continued to burgeon. In New York alone, the well-established American Opera Society was to be joined during the 1962–63 season by three new organizations, the Concert Opera Association, under the direction of Thomas Scherman, the Friends of French Opera, under that of Robert Lawrence, and the National Music Theatre, conducted by Anthony Amato. These groups announced integral or partial concert performances of Spontini's *La Vestale,* Richard Strauss's *Intermezzo,* Rossini's *Guillaume Tell,* Dukas' *Ariane et Barbe-bleue,* Meyerbeer's *Les Huguenots* (which was splendidly revived in Italian at La Scala, Milan, in June 1962), Massenet's *Don Quichotte* and *La Navarraise,* Stravinsky's *The Rake's Progress,* Rossini's *L'Italiana in Algeri,* Donizetti's *Maria di Rohan,* Bellini's *I Puritani,* and Verdi's *Luisa Miller* and *La battaglia di Legnano.*

Musical Surveys.—*Musical America's* annual survey of orchestras covered 38 symphonic organizations in 26 states. It showed the following composers leading in number of performances in the categories named: "Foreign Standard"—Beethoven (358), Brahms (218), Mozart (206), Tchaikovsky (125), Wagner (117), Richard Strauss (104), Haydn (97), Johann Sebastian Bach (95), Berlioz (85), Ravel (85); "Foreign Modern"—Prokofiev (105), Stravinsky (83), Shostakovich (49), Bartók (47), Hindemith (43); "American"—Samuel Barber (31), Aaron Copland (22), William Schuman (16), Howard Hanson (15), Walter Piston (14), and Virgil Thomson (12).

The American Music Center published a survey of 430 American composers. No income from compositions was reported by 145 of them; 77 reported annual incomes from that source of less than $100; 106 reported incomes between $100 and $1,000; only 17 reported annual incomes of more than $5,000 per year from their compositions. Almost 80 per cent of the 430 composers gave teaching as their primary source of income.

Premieres and Discoveries.—Important first performances not mentioned above but heard during the 1961–62 season included (*W.:* world premiere; *U.S.:* United States premiere; *N.Y.:* New York premiere): Pablo Casals' *El Pesebre* (*U.S.,* San Francisco, April 18, 1962); David Diamond's Symphony No. 7 (*W,* Philadelphia, Jan. 26, 1962) and Symphony No. 8 (*W,* New York, Oct. 26, 1961); Manuel de Falla's *Atlàntida* (*W,* Barcelona, Spain, Nov. 24, 1961); Vittorio Giannini's *Medead* (*N.Y.,* Oct. 31, 1961); Peggy Glanville-Hicks' *Nausicaa,* with libretto by Robert Graves (*W,* Athens, Greece, Aug. 19, 1961); Alexei Haieff's Symphony No. 3 (*N.Y.,* Nov. 15, 1961); Hans Werner Henze's Symphony No. 2 (*N.Y.,* Nov. 21, 1961); Paul Hindemith's *The Long Christmas Dinner,* with libretto by Thornton Wilder (*W,* Mannheim, Germany, Dec. 1961); Zoltán Kodály's Symphony 1961 (*N.Y.,* Feb. 6, 1962); Dmitri Shostakovich's Symphony No. 12 (*W,* Leningrad, USSR, Oct. 1961); Louise Talma's

Alcestiade, with libretto by Thornton Wilder (*W. Frankfurt am Main, Germany, March 1, 1962*); Peter Ilich Tchaikovsky's Symphony No. 7, reconstructed by Semyon Bogatyryev (*N.Y., Feb. 27, 1962*).

An important discovery of musical manuscripts was made when the Soviet government permitted three Italian musicologists to comb operatic archives in Leningrad, largely those of the Kirov (formerly Mariinski) Theater. In addition to the manuscript score of *La forza del destino* which Verdi used for the 1862 world premiere, the find included six operas by Giovanni Paisiello, three operas and a cantata by Domenico Cimarosa, two operas by Catterino Cavos (earlier settings of stories used later by Glinka in *A Life for the Tsar* and by Dargomyzhski in *Rusalka*), and early operatic versions of the stories used in Beethoven's *Fidelio* (Ferdinando Antonolini's *Leonora*) and Mozart's *Don Giovanni* (Vincenzo Righini's *Il convitato di pietra*).

Festivals.—The annual Festival of Two Worlds at Spoleto, Italy (June 21–July 22) had performances of three operas (Prokofiev's *The Love for Three Oranges,* Bizet's *Carmen,* and Rossini's *Le Comte Ory*), the Verdi Requiem, ballets, chamber music, plays, motion pictures, and art exhibitions. In England, the Glyndebourne Festival Opera was in the midst of its annual season (May 21 to Aug. 19, 1962) when its founder, John Christie, died after 28 years of unremitting effort to present opera of the highest category. The works heard at Glyndebourne in 1962 included Debussy's *Pelléas et Mélisande,* Mozart's *Le nozze di Figaro* and *Così fan tutte,* Monteverdi's *L'incoronazione di Poppea,* Richard Strauss's *Ariadne auf Naxos,* and Donizetti's *L'elisir d'amore.*

Music festivals and special series of summer concert and opera now have become so numerous that reporting even a small portion of them here has become impossible. Likewise, the exchange of performing musical organizations and soloists between the United States and the USSR and other Communist countries now has become so constant as to have lost most of its novelty. Psychologists alone might be able to explain why American and "Iron Curtain" audiences appear to be vying to outdo one another in showing appreciation of each other's performers.

Jazz.—Little that really was new developed in the world of jazz in the 1961–62 season, but the hope was that the continuing general climate of experiment might ease the way for the emergence of strong new personalities. Two innovators—both tenor saxophonists—acclaimed as that sort of pathbreaker made news. One, Sonny Rollins, returned after a retirement of several years. He played as well as, or perhaps better than, before, but remained essentially unchanged. The other, Ornette Coleman, carried on his controversial improvisations based on theories of free tonal and harmonic bases, in a recorded experiment for double quartet, *Free Jazz.* It seemed formless, arbitrary, and devoid of both excitement and conviction.

"Funky"—the return to the blues roots—appeared (especially in its piano form) to be settling into clichés shared by virtually all of its exponents, thus differing from its earlier barrelhouse prototype, which had great variety in both personal and regional styles.

Jazz festivals continued to flourish. The pioneering Newport (R.I.) Festival, which had lapsed, was revived under new management. What was potentially the most significant of these festivals—the first International Jazz Festival, presented May 31 to June 3 by the President's Music Committee of the People-to-People Program in Washington, D.C.—proved disappointing. Its program of several days ranged from folk blues and gospel singing through New Orleans marching jazz and Duke Ellington's swing to the latest efforts in the "Third Stream" (this last being the designation of continuing efforts to hybridize jazz and classical music since Paul Whiteman's "symphonic jazz" of 1924). The response of audiences and critics was virtually unanimous: great enthusiasm for the archaic jazz of the Eureka Brass Band of New Orleans, which was organized in 1881; applause for Duke Ellington's orchestra, but reservations about some of his more recent compositions; boredom over the hybrids presented in premieres—the Jazz Ballet and the "Third Stream" compositions of Gunther Schuller of New York and André Hodeir of Paris.

LOUIS MÉLANCON

One of six new productions by the Metropolitan Opera for 1962–63 was Richard Strauss' *Ariadne auf Naxos,* featuring Gianna d'Angelo (center) and Leonie Rysanek (upper right).

GENERAL DYNAMICS CORP.

NARCOTICS

The 17th Session of the U.N. Commission on Narcotic Drugs met at Geneva, Switzerland, May 14–June 1, 1962.

Illicit Traffic.—Illicit traffic in opium and the opiates, cannabis, and cocaine continued to be excessive. Opium to supply addicts in many countries was produced clandestinely in the Burma-China-Laos-Thailand border areas, the so-called Yunnan region.

Burma, Thailand, Hong Kong, and Singapore reported much illicit traffic in opium. Large quantities of raw opium were seized in the Middle East. Clandestine manufacture of morphine and heroin was reported in Lebanon, Iran, Syria, and Turkey. Six heroin laboratories were found in Hong Kong. Thailand reported increasing heroin traffic since prohibition of opium there in 1959. Mexican authorities destroyed sizable areas of poppy cultivation and intensified efforts with United States authorities to stamp out illicit cultivation and traffic.

Seizures of cannabis exceeded those of 1960, but heavy traffic continued in the Middle East and Latin America. Mexican and United States authorities continued close cooperation to control cannabis abuse.

Cocaine traffic spread through Latin America to other parts of the world, notably Canada, the United States, the Mediterranean area, and Asia. Cocaine seized in the United States originated largely in Bolivia, Colombia, Panama, and Peru.

Single Convention.—The Single Convention as concluded by the Plenipotentiary Conference on March 25, 1961, is unacceptable to the United States because it would weaken international control of narcotic drugs.

Technical Assistance.—In late 1961 the Inter-American Consultative Group on Narcotics Control met in Rio de Janeiro, Brazil, to discuss narcotics problems of Latin America. Also in late 1961, customs and police officials from 13 countries toured seaports and airports in Southeast Asia to study and exchange information on enforcement experiences and to encourage regional and international technical cooperation.

A United States mission to governments in the Middle East visited seven countries between February and April 1962.

Addiction.—Extensive abuse of morphine and heroin was reported, and large-scale abuse of opium continued in the Far East and parts of the Middle East. Cannabis abuse was more widespread geographically than that of any other drug. Cocaleaf chewing presented a serious problem in some South American countries. The World Health Organization and the U.N. Commission on Narcotic Drugs agreed on the importance of an absolute drug-free environment during the withdrawal phase of treatment of addiction.

United States.—A joint statement on narcotic addiction in the United States released May 14, 1962, by the American Medical Association and the National Research Council, and a concurring statement on the same date by the Bureau of Narcotics, emphasized the common objectives of strengthening present efforts to reduce and, if possible, eliminate addiction; providing the best possible treatment and rehabilitation services to addicted persons; and correcting the erroneously held view that federal law considers addiction a crime.

HENRY L. GIORDANO,
U.S. Commissioner of Narcotics.

NASSER, Gamal Abdel. See biographical sketch under UNITED ARAB REPUBLIC.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION. See SPACE FLIGHT.

NATIONAL BUDGET. See TREASURY DEPARTMENT.

NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards (NBS) of the U.S. Department of Commerce, established by act of Congress in 1901, has three major responsibilities: (1) It develops and maintains the national standards of physical measurement, providing means for their utilization. (2) It determines fundamental physical constants and the basic properties of materials. (3) It operates central research and technical service programs for the federal government. In fulfilling these responsibilities, it conducts research and development programs in physics, chemistry, applied mathematics, and some branches of engineering.

In 1962 the total staff numbered about 3,800, most of whom were stationed at the bureau's principal laboratories in Washington, D.C., and Boulder, Colo. Twenty-six field stations were also operated in the United States and abroad.

In April 1962, NBS and the University of Colorado announced the collaborative establishment of the Joint Institute for Laboratory Astrophysics (JILA) on the campus of the university, at Boulder. This unique organization will provide a center for both research and advanced training in areas of physics and astrophysics that are vital to the space program.

Measurement Standards.—A number of advances were made in the field of electrical measurements in 1962. Design of a highly stable, shielded 100-megohm resistor made it possible to measure direct-current voltages up to 100,000 volts to within 20 parts per million. For determining the

voltage ratio and phase angle corrections of instrument voltage transformers, a 1-picofarad, 350,000-volt free-air capacitor was designed and constructed. With this device, an accuracy of 3 parts per hundred thousand was obtained in calibrating instrument transformers for use on 350,000-volt power lines. A rapid, convenient method was developed for calibrating the standard-resistance voltage divider (volt box) at its rate voltage. To aid in setting up standards of dielectric materials, the bureau designed an improved three-terminal dielectric-specimen holder with which high-precision dielectric measurements can be made at room temperature.

In research directed toward the extremely accurate measurement of distances up to a yard or more, a gaseous (helium-neon) laser was constructed and put into operation. Experimental results indicated that it is theoretically possible with this device to make measurements over a distance of 60 miles with a precision of one part in a million.

The accuracy requirements of modern mass production have made necessary the use of master ball bearings, whose sizes are known to a very high degree of accuracy, for size control in manufacturing plants. Methods were developed for measuring the diameters of master ball bearings up to 3 inches in diameter with a certified accuracy of 2 millionths of an inch. An interferometer was also developed for measuring deviations from sphericity of small ball bearings.

During 1962 the national standard neutron source was absolutely calibrated by a new method involving the use of a manganese sulfate bath filled with heavy water. The uncertainty of this measurement was approximately 1%, representing a considerable improvement over previous determinations.

Matter and Materials.—By exposing substances to gamma radiation under high pressure, it was found possible to prepare polymers from monomers, such as carbon disulfide, which do not normally polymerize. This work, which may provide a basis for the production of new types of polymeric materials, was part of a program conducted for the Office of Army Research to increase knowledge of radiation and polymerization processes.

A new value for the atomic weight of chlorine was determined during the year. The atomic weight of this element, together with that of silver, forms a basis for the determination of atomic weights of many of the other elements. The new value is $35.45273\left[\begin{matrix}+0.00092\\-0.00097\end{matrix}\right]^{1}$; it is based on a mass-spectrometric determination of the isotopic abundance ratio of natural chlorine which was carried out by the bureau with the cooperation of the Atomic Energy Commission.

Radio Propagation.—An installation for ground-based explorations of the upper atmosphere and outer space was constructed by the NBS Central Radio Propagation Laboratory and the Instituto Geofisico de Huancayo (Peru) at a site 17 miles east of Lima, Peru. Known as Jicamarca Observatory, this installation makes use of a scatter radar technique developed by NBS in 1959. It employs a 6 million-watt pulse transmitter and a 22-acre antenna to transmit to great heights a very-high-frequency radio wave lasting from 50 to 1,500 millionths of a second. With this equipment, electron densities 4,000 miles above the earth were measured. (See also ATMOSPHERE RESEARCH.)

[1] The quantities in brackets are estimated limits to the uncertainties in the reported value arising from known sources of error, both random and systematic.

Publications.—A review of the bureau's work during the fiscal year is published annually as *Research Highlights of the National Bureau of Standards*, available from the Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C. More detailed treatment of scientific results is provided by the bureau's three periodicals (*Journal of Research, Technical News Bulletin,* and *Basic Radio Propagation Predictions*) and a series of nonperiodical publications. Indexed lists of publications (NBS Circular 460 and Supplement, complete through June 1957, $2.75; and NBS Miscellaneous Publication 240, July 1957 to June 1960, $2.25) are available from the Superintendent of Documents.

ALLEN V. ASTIN,
Director, National Bureau of Standards.

NATIONAL GEOGRAPHIC SOCIETY

Founded in 1888 "for the increase and diffusion of geographic knowledge," the society will observe its 75th anniversary in 1963. This nonprofit scientific and educational organization numbered more than 3 million members in 1962. Member dues support its activities, which include far-ranging exploration and research and the publication of the monthly *National Geographic Magazine*, maps, globes, books, news, and school bulletins.

Research, 1962.—Four undersea projects directed by leaders of past National Geographic expeditions were among nearly 30 undertakings aided by society grants. In the Mediterranean, Edwin A. Link tested a new diving chamber as the first stage of his "Man in Sea" project, designed eventually to enable men to live and work under the sea for weeks at depths of hundreds of feet. With similar objectives, Capt. Jacques-Yves Cousteau constructed an "undersea home" for two divers, storing air and other supplies needed for prolonged sea-floor forays. University of Miami marine scientists studied Florida's coral-reef denizens. A University of Pennsylvania Museum team of deep-diving scientists applied precise surface archaeological methods to excavation of ancient shipwrecks in Turkish waters.

The year marked a fourth season on Wetherill Mesa in Mesa Verde National Park, Colorado, where National Geographic-National Park Service archaeologists largely completed restoration and study of five fortresslike cliff dwellings of pre-Columbian Indians, soon to be opened to park visitors.

In Africa, Dr. and Mrs. Louis S. B. Leakey, renowned for their 1959 find of 1,750,000-year-old, tool-making *Zinjanthropus boisei,* unearthed in Kenya the fossil bones of a hominoid primate in strata laid down 14 million years ago.

In southern Asia and Australia, Edward S. Ross, California Academy of Sciences, added 175,000 insect specimens, emphasizing the order Embioptera, to his 20-year collection. In the Yellowstone Park area of the United States, John and Frank Craighead completed a fourth season of field study of grizzly bear ecology.

The society became a major sponsor of the forthcoming (1963) expedition of American climbers and scientists to Mt. Everest and neighboring peaks. It also joined with Lowell Observatory in preparing a photographic study of the brighter planets.

Awards.—The society's Hubbard Medal was presented to Dr. and Mrs. Louis S. B. Leakey jointly on March 23 for their distinguished researches on early man. A second

award was given to astronaut John H. Glenn, Jr., on April 9 "for extraordinary contributions to scientific knowledge of the world and beyond as a pioneer in exploring the ocean of space." A Jane Smith Award honored Vice President Lyndon B. Johnson on June 8 for "contributions to geography through his far-ranging travels and untiring efforts to bring the peoples of the world closer together."

The society commissioned an 8-foot bronze of Rear Adm. Richard E. Byrd, which became the first statue to take position in a planned row of heroic Americans to flank Memorial Avenue in Arlington, Va., between Arlington Cemetery and the Potomac River.

Publications.—The society published in 1962 *America's Historylands* and *Men, Ships, and the Sea.* As a public service it contributed the photography, engravings, and editorial guidance needed to produce the first official guide to the White House, also published in 1962.

National Geographic cartographers produced seven Atlas Series map supplements to the magazine and revised four large wall maps. They also produced a new 16-inch world globe and a revised 12-inch globe in standard and illuminated models.

The School Service introduced color illustrations into its weekly Geographic School Bulletin. The News Service issued 300 bulletins to daily newspapers during the year.

Officers.—Society officers in 1962 were Melville Bell Grosvenor, president and editor; Melvin M. Payne, executive vice president and secretary, succeeding Thomas W. McKnew, who became vice chairman of the Board of Trustees; Robert V. Fleming, vice president and treasurer; Frederick G. Vosburgh, vice president and associate editor; Robert E. Doyle and Thomas M. Beers, vice presidents and associate secretaries; and Gilbert Grosvenor, chairman of the board.

MELVILLE BELL GROSVENOR,
President and Editor.

NATIONAL GUARD

Army and Air National Guard activities in the fiscal year 1962 are reviewed in the following article. (For a discussion of subsequent National Guard developments, see ARMY OF THE UNITED STATES; NATIONAL SECURITY.)

The partial mobilization of the Army and Air National Guard in October 1961 brought to active duty nearly 65,000 Guardsmen to serve their country in a new mission—that of preventing a war. The rapid build-up of the active Army in response to the Berlin crisis included nearly 44,400 officers and enlisted men in 447 company and detachment size units of the Army National Guard. The major elements of this force were the 32d (Red Arrow) Infantry Division of Wisconsin and the 49th (Lone Star) Armored Division of Texas.

The Air National Guard mobilized over 21,000 officers and airmen. The units mobilized consisted of 6 tactical fighter wings, 1 tactical reconnaissance wing, 2 air transport wings, and 3 fighter intercepter squadrons, all with their support units; 1 tactical control group consisting of 1 tactical control squadron, 3 aircraft control and warning squadrons, and 3 aircraft control and warning flights; and 8 separate weather flights (forecasting and observing).

Army National Guard.—On June 30, 1962, exclusive of the personnel in active federal service, the Army National Guard had a federally recognized strength of 360,970, of whom 31,458 were officers and warrant officers and 329,512 were enlisted men. At the end of fiscal year 1962, 37,087 were undergoing training in the Army's six-month training program.

During fiscal 1962, approximately 320,000 Army Guardsmen attended 15 days of annual active duty for training. Army Service and Army Area schools enrolled 9,941 Guardsmen. Fifty accredited Army National Guard State Officer Candidate Schools enrolled 3,478 officer candidates, and Special Officer Candidate Courses for Army National Guard enlisted men, conducted at Fort Benning and Fort Sill, enrolled 480.

Air National Guard.—On June 30, 1962, exclusive of personnel in active federal service, the Air National Guard had a federally recognized strength of 50,319, including 6,278 officers and 44,041 airmen. The number of federally recognized units in the Air National Guard troop basis totaled 626, including the units still in active federal service. The units not on active duty were located at 62 flying fields and 72 nonflying installations, and were organized into 15 wings, 43 groups, and 35 tactical squadrons.

During fiscal 1962, the Air National Guard converted 10 of its squadrons to different types or series of aircraft. On June 30, 1962, the 1,263 aircraft of the Air National Guard were almost all first-line.

As of June 30, 1962, 27 squadrons were participating in the active air defense of the United States by maintaining aircraft and crews on 5-minute runway alert status—26 on a 24-hour-a-day basis and 1 on 14-hour schedules. In addition, 4 aircraft control and warning squadrons were actively participating in round-the-clock air defense operations.

During fiscal 1962, 71,731 Air Guardsmen attended 15 days of annual field training. Air Force schools graduated 45 pilots and navigators and gave technical training to 1,252 officers and airmen of the Air National Guard.

DONALD W. MCGOWAN,

NATIONAL PARKS AND MONUMENTS

The total number of visits to the scenic, historic, and scientific units of the national park system since 1904 passed 1 billion in 1962. In 1904, when records of such visits were first kept, they totaled 120,690; in 1962 they exceeded 80 million.

"Billionth Visitor Day" observances were held on August 22. Visitors entering the various areas at a time predetermined by the National Park Service but unknown to the visitors were given a special welcome and presented with certificates. With more than 190 areas in the park system, it was impossible to pinpoint the billionth visitor.

Scores of new visitor facilities, including campgrounds, minor roads, trails, visitor centers, and lodge and cabin developments, were completed in 1962 under the Mission 66 program. This park conservation and development program envisions a National Park System adequately equipped and staffed by 1966, the National Park Service's 50th anniversary year. The program has been under way since mid-1956.

Significant progress was made in 1962 on the service's program of selecting, while still available, outstanding scenic, historic, and scientific areas of national significance for addition to the National Park System. Many such areas have been surveyed by the Park Service, and detailed studies have been made of 20. Among these, several were specifically named in President Kennedy's conservation message to Congress on March 1, 1962, including Point Reyes National Seashore, California, which was established by an act of Congress approved by the president on Sept. 13, 1962; Padre Island National Seashore Park, Texas (approved by the president on Sept. 28, 1962); and Sagamore Hill National Historic Site, New York. Establishment of this last site to preserve the home of Theodore Roosevelt at Oyster Bay, Long Island, N.Y., and the preservation of Roosevelt's birthplace

Point Reyes, a ruggedly beautiful peninsula north of San Francisco, Calif., became a national seashore area by act of Congress in 1962.

NATIONAL PARK SERVICE

in New York City as a national historic site were authorized by act of Congress on July 25, 1962.

Buck Island Reef, near St. Croix, Virgin Islands, became a national monument late in 1961, thus assuring preservation of one of the finest marine gardens in the Caribbean.

Abraham Lincoln's boyhood home in Lincoln City, Ind., and Alexander Hamilton's home in New York City were established as national memorials by acts of Congress of Feb. 19 and April 27, 1962, respectively.

Areas administered by the National Park Service now total 187 and are classified as follows:

Type of area	Number	Approximate federal land (acres)
National parks	31	13,332,917
National historical parks	9	31,883
National monuments	80	8,926,192
National military parks	11	29,023
National memorial park	1	69,169
National battlefields	4	2,167
National battlefield parks	3	5,848
National battlefield sites	3	208
National historic sites	16	1,990
National memorials	14	4,680
National cemeteries	10	215
National seashore recreational area	1	24,705
National parkways	3	96,673
National capital park[1]	1	34,767
Total, National Park System	187	22,560,437
National recreation areas	4	3,442,775
Total, all areas	191	26,003,212

[1] A system administering 770 units, including Catoctin Mountain Park, Prince William Forest Park, the Baltimore-Washington Parkway, and the Suitland Parkway.

Delegates from some 70 nations attended the First World Conference on National Parks in Seattle, Wash., June 20–July 7. The event was cosponsored by the National Park Service, the International Union for the Conservation of Nature and Natural Resources, and other United Nations and federal agencies.

CONRAD L. WIRTH,
Director, National Park Service.

NATIONAL RESEARCH COUNCIL OF CANADA

An agency of the Canadian government established in 1916 by an act of Parliament to promote scientific and industrial research, the council operates nine laboratory divisions in Ottawa, as well as regional laboratories in Halifax and Saskatoon. The council engages in basic research, long-term applied research as background for development by industry, contract research and testing, and the development and maintenance of Canada's fundamental standards. Of its annual budget of about $42 million, some $11 million is spent for grants-in-aid of research and graduate scholarships in science and engineering in Canadian universities, and a shared-cost industrial research assistance program. Forty associate committees coordinate research efforts on specific problems of national interest.

The council publishes *Canadian Journals of Biochemistry and Physiology, Botany, Chemistry, Microbiology, Physics, and Zoology.* It provides travel grants for Canadian delegations to scientific meetings and conferences, provides scientific attachés to Canadian embassies in London, Washington, and Paris, and represents Canada in the activities of international scientific unions. In addition to its other activities, the council advises manufacturing concerns about technological and industrial engineering problems; it operates a subsidiary, Canadian Patents and Development, Ltd., to handle licensing of inventions from the council, other federal and provincial research organizations, and Canadian universities.

Its staff of 2,600 includes 730 scientists and engineers, of whom 690 are engaged in research. The council consists of a president (B. G. Ballard, acting, at the end of 1962, succeeding Dr. E. W. R. Steacie, president since 1952, who died on August 28), three vice presidents, and 17 members representing universities, industry, and labor. It meets three times yearly in Ottawa. Its publications also include an *Annual Report,* the annual *NRC Review, NRC Research News,* and the *List of Publications 1918–1952* (3d ed.).

R. A. LAY,
Public Relations Office,
National Research Council of Canada.

NATIONAL SCIENCE FOUNDATION

The National Science Foundation (NSF) is an independent agency of the federal government created by Congress in 1950 with the principal functions of promoting basic research, furthering education in the sciences, and facilitating improved dissemination of scientific information. NSF also maintains the National Register of Scientific and Technical Personnel.

During the fiscal year ending June 30, 1962, NSF's appropriation was $263 million, of which $96 million was awarded in the form of 2,572 grants for basic research. The foundation spent $56 million for construction and maintenance of research facilities and national research centers, and $84 million for education programs. NSF awarded 4,791 fellowships for study and advanced training during the year, and supported 911 summer, academic-year, and in-service institutes with a participation of more than 40,000 teachers of science and mathematics. NSF also conducts several national research programs, which include the Antarctic Research Program, the Weather Modification Program, and Project Mohole.

A new program was begun during the past year in response to a great and demonstrated need by colleges and universities for instructional scientific equipment to upgrade and modernize sci-

ence instruction at the undergraduate level. In Project Mohole—an NSF-funded project aimed at boring through the earth's crust into its mantle—plans were being developed for the actual drilling as a result of successful testing in 1961. NSF is also planning and coordinating federal support for United States participation in the International Indian Ocean Expedition in 1963–64.

Major NSF publications in 1962 included: *Federal Funds for Science (X)*, the *NSF Third Annual Weather Modification Report, Long-Range Demands for Scientific and Technical Personnel,* and the *Eleventh NSF Annual Report.*

ALAN T. WATERMAN,
Director, National Science Foundation.

NATIONAL SECURITY—U.S. MILITARY POLICY

The rapid buildup of United States defenses which began in late 1961, following the Soviet Union's threats with relation to the freedom of West Berlin, continued steadily throughout 1962, and planning for future financing and procurement indicated a still higher level of combat potential in 1963. The buildup was both quantitative, as measured in men and material, and qualitative, as measured by superior training and by increases in the power or flexibility of the weapons, and was accompanied by administrative reforms designed to make the defense mechanism more quickly responsive to such diverse possibilities as can be foreseen.

The boldness of some of these reforms, largely initiated by the secretary of defense, Robert S. McNamara, in some instances disturbed the Congress. Veteran members both of the Senate and House opposed parts of the secretary's program, actually blocked much of that affecting the reserve forces, and, in the case of newly designated defense agencies, warned against such further exercises of authority without the prior approval of Congress. Despite such opposition, Secretary McNamara's activities since taking office in January 1961 have resulted in a far greater centralization of real authority. The significance of this development may in time prove to be as important as the improvement in the purely military formations and weaponry.

A major reform, whose promise is large but whose value is not measurable in advance, is the five-year planning concept. Under this concept the Joint Chiefs and their planning staff look far beyond the coming fiscal year, exploring the more distant probabilities in world affairs and the nation's requirements for adjusting to them. Thus a purely tentative and wholly flexible program is devised in which the finite one-year budget is only the recognized first step. The aim is to adopt a more considered approach to each large program—permitting speedup or cutback as soon as desirable—and to establish a continuity of planning free from the alternation of ill-planned extravagances and too-sharp economies which, for lack of such a mechanism, has often characterized national defense administration.

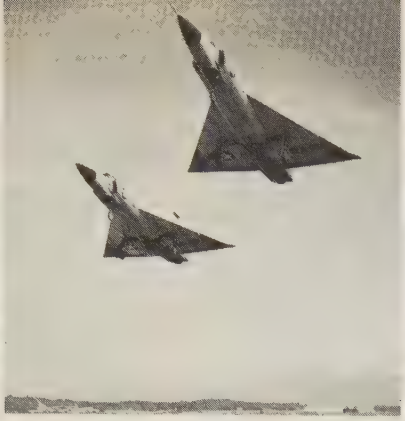
The five new and vigorous defense agencies (National Security, Defense Atomic Support, Defense Communications, Defense Supply, and Defense Intelligence—only the last two created by McNamara) coordinate and largely direct the relevant activities of the three armed services. They are in large measure the necessary tools for any such well-centralized, long-range planning as the secretary's five-year program contemplates.

Ever since the creation of the National Defense Establishment following World War II, there has been an absorption of new powers by the central Defense Department at the cost of the three subdepartments of the Army, Navy, and Air Force. This trend has been most evident, however, under Secretary McNamara. Congressional hostility to a single chief of staff with concentrated powers was restated in two Armed Services Committee reports in 1961, and this issue was expected to reappear in Capitol Hill defense discussions in 1963.

The year 1962 brought into better balance the nation's two arming programs—against nuclear war and against non-nuclear war. The first has long been recognized as essential, but the second was only recently elevated appreciably above its previous level, on the reasoning that, with some degree of nuclear deterrence a strong possibility, there might be more rather than less resort to "small" or "border" or "fringe" wars. Hence the nation granted much larger aid to non-nuclear forces, particularly to those of the Army, whose needs had been urged by successive chiefs of staff. The president's appointment of Gen. Maxwell D. Taylor (former Army chief of staff, who had retired from active duty after unsuccessfully expressing these needs) first as his chief military adviser and then as chairman of the Joint Chiefs (succeeding Gen. Lyman L. Lemnitzer, effective Sept. 30, 1962) was widely regarded as assuring a better non-nuclear force without reduction of nuclear powers.

(*Left*) Gen. Maxwell Taylor is sworn in as chairman of the Joint Chiefs of Staff by Attorney General Robert Kennedy on October 1 as President Kennedy (left) looks on. (*Right*) Taylor's predecessor, Gen. Lyman Lemnitzer (at right) and Defense Secretary Robert McNamara urge Senate Armed Services Committee, September 10, to permit president to call up reserves.

WIDE WORLD



PICTORIAL PARADE; U.S. AIR FORCE; UPI

(*Left*) Dye 3, a Distant Early Warning Line radar tower, went into operation in 1962 in Greenland. (*Center*) Two Air Force F-102 jets from Elmendorf AFB, Alaska, patrol the skies for hostile aircraft. (*Right*) Spherical radomes, two of which are shown under construction in Fylingdales, England, are part of United States–Great Britain ballistic missiles warning system.

The West Berlin crisis continued in 1962, and was met by the United States with a continued state of alert. President Kennedy's decision to strengthen United States military resources had called for the summoning to active duty of reservists from all the armed services. Their full year of such service expiring in the summer and autumn of 1962, the reservists were returned to civilian life; but meanwhile the slower, better-rounded buildup of the regular establishments had been effected, and in 1962 the nation's policy decisions both in Europe and the Far East could be stated more firmly by reason of a more complete military backing. Even so, in September the president asked and received from Congress authorization to call a different lot of 150,000 reservists to active duty should the need for them arise while Congress stood in recess.

More quickly than anticipated, this authority was invoked in late October with the rise of the crisis over the Soviet Union's installation in Cuba of offensive weapons (medium- and intermediate-range missiles, bombers, and related equipment). President Kennedy called up over 14,000 Naval Reservists for sea and air duty associated with the quarantine of Cuba and the subsequent observation of vessels removing the offensive weapons. In addition, 14,200 men of the Air Force Reserve were called up, and discharges of all Navy and Marine Corps personnel were halted. These orders remained in effect until November 21, by which time the crisis had eased.

The armed services' high-command personnel, by reason of retirements and consequent new appointments, automatically became more closely related to the current administration. General Taylor's return to active duty, this time in the top military post, has been mentioned. Gen. Earle G. Wheeler became Army chief of staff on Sept. 30, 1962, replacing Gen. George H. Decker, who retired. Adm. George W. Anderson, Jr. (a Kennedy appointee), Gen. Curtis E. LeMay, and Gen. David M. Shoup remained as heads of the Navy, Air Force, and Marine Corps, respectively. Thus three of the nation's five top military officials were selected by President Kennedy.

Mutual Security.—The action of the United States with regard to the Berlin crisis was obviously linked to the role of the United States within the North Atlantic Treaty Organization (q.v.). This led, in June, to a publicly stated clarification by Defense Secretary McNamara of the nation's views on the proper division of responsibilities among the NATO allies. The policy statement gave new assurance of the United States' firm support of NATO and of its ability to supply all of the alliance's nuclear requirements. It pointedly sought to discourage other allies from building up their own nuclear powers and, rather, suggested plainly that they could more usefully build up their non-nuclear contributions to NATO's total strength.

Related to this policy was an increased effort to reduce the continuing heavy American expenditures overseas in behalf of NATO and individual allies, resulting in a $3 billion annual excess of payments abroad in international dollar movements. The total volume of foreign military and economic aid was a factor in this imbalance, but the pattern has changed radically in the past decade—that is, the stronger European nations need less and less (several of them now get none at all) while some of the weaker nations of Europe and Asia, still far from secure either militarily or economically, need more assistance than formerly by reason of increased pressures both external and internal. The total dollars expended in United States aid in the numerous mutual security programs have declined but by no means ceased. To congressional critics suggesting still deeper cuts in foreign aid, the military professionals have consistently argued that in most cases United States dollars spent overseas on the improvement of indigenous military forces are productive of more security for the United States itself than would result from a like amount spent directly on the United States armed services. (See also FOREIGN AID PROGRAMS, U.S.)

In Southeast Asia, United States aid took on a modified form. The requirements in South Vietnam (and for a time in Thailand) became more acute with an increased flow of Communist armed parties from North Vietnam across Laos up to the borders, and with a dangerous expansion of Communist cells in South Vietnam accompanied by violent local actions. The United States thereupon sent a larger number of the Army's sharply trained Special Forces personnel, as well as U.S. Air Force and Navy personnel, to South Vietnam as instructors of the government forces, plus much larger shipments of supplies, notably of weapons and equipment best suited to counterguerrilla work. Thus aided, the South Vietnam forces during the year undertook restoration of internal order with increased success, but there was no doubt that the elimination of enemy guerrillas would require years of such effort. (See also VIETNAM.)

Beyond this purely military aid, the U.S. Army introduced in the Far East (and to a much lesser degree in Latin America) programs for coping with other forms of Communist activity. Small teams of highly trained specialists in engineering, communications, medicine, sanitation, education, and transport were sent in, partly to

provide their needed help directly to underdeveloped peoples, and chiefly to train community leaders in these arts so that benefits might expand rapidly and with permanent value. The concept is that improvement of the living conditions of underprivileged peoples is a first step in eliminating their discontent and susceptibility to agents of sedition, and in promoting sound self-government which can better resist enemy aggression, thus reducing such nations' need for military assistance. This Army activity is distinct from that of the Peace Corps.

Space and Missiles.—From both the White House and the Pentagon came formal declarations that the United States' present capabilities in nuclear weapons were such that, while maintaining its nonaggressive policy, the United States could absorb a first assault by an aggressor, survive it, and still respond with a retaliatory fire so great as to overwhelm the aggressor nation. The program for the Atlas intercontinental ballistic missile (ICBM) now is complete; that for the later and larger Titan ICBM is nearing completion; and that for the much smaller and cheaper (but highly efficient) Minuteman ICBM is well advanced. It is the latter weapon which in 1963 is expected to greatly swell the nation's total number of ICBM's to 500. As to nuclear weapons of all sizes, the deputy secretary of defense has referred to weapons numbering "in the tens of thousands," this of course including the smaller field weapons now in supply. (See also Missiles.)

Continental Defense.—Divergent views on defense against long-range enemy attacks continued to torment policymakers. One school of opinion held that against the combined effects of blast and persistent radioactivity there is no reasonable defense; the other contended that multiple shelters properly equipped might save the lives of many millions. To the latter end a more vigorous civil defense program was initiated by the Department of Defense, subject to congressional support—which in the past has proved somewhat difficult to obtain.

There was apparent in Congress a fuller acceptance of the deterrence theory—that if the United States could absorb an enemy's first blow with all his ICBM's and still have enough missile power remaining to destroy that enemy, the enemy would not dare initiate a nuclear war. This largely explains Congress' hearty support of the scheduled large-scale production of the Minuteman and Polaris missiles. Even so, the enlarged civil defense program has made headway in its survey of missile shelters in metropolitan centers (see also Civil Defense).

Armed Forces Strength.—The U.S. Army, which a year earlier had 11 combat divisions and 3 purely training divisions, in 1962 attained a strength of 16 combat divisions at high readiness; its recruit training had been taken over by other elements. Of the 16 divisions, 5 were in West Germany (plus a massive number of support elements composing the corps and field army), 2 in Korea, 1 in Hawaii, and 8 in the Strategic Army Corps in the United States. Smaller units garrisoned Alaska, the Caribbean, and Okinawa.

As of the end of the year, the Navy had 9 Polaris-type nuclear submarines (each carrying 16 missiles) at sea and 28 others under construction or authorized; 22 nuclear attack-type submarines at sea and 17 others on the way; 113 conventional submarines; 16 attack-type aircraft carriers and 16 support carriers; 12 cruisers, most of them carrying guided missiles; 62 new-type frigates and destroyers at sea and authorized; 205 older-type destroyers at sea; and 85 destroyer escort-types built and building. The Air Force had 200 ICBM's as of Jan. 1, 1963, and 16,300 planes, comprising 37 strategic and 37 tactical wings (the latter increasing sharply) and 18 air defense wings, plus 132 squadrons of fueling, transport, and miscellaneous types.

Total numbers of armed forces personnel were as follows on June 30, 1961 and 1962, and as planned for June 30, 1963:

	Actual		Planned
	June 30, 1961	June 30, 1962	June 30, 1963
Army	858,622	1,066,404[1]	960,000
Navy	627,089	666,428	665,315
Marines	176,909	190,962	190,000
Air Force	821,151	884,025	868,566
Total, armed forces	2,483,771	2,807,819[1]	2,683,881

[1] The 1962 figures (particularly the Army's) reflect the temporary presence on active duty of 145,000 reservists.

Reserve Forces.—The year 1962 provided a severe test of readiness of Army, Navy, and Air Force reserve systems. Navy and Air Force reservists, both in units and as individuals, moved overseas smoothly. Mobilized Army reservists, however, encountered difficulties because of incomplete records, faulty notification methods, and lack of equipment. The deficiencies were corrected shortly, but they served to strengthen Secretary McNamara's decision to effect major reforms of organization. He proposed to Congress the changing of function of over 1,000 units of the National Guard and Army Reserve, and the elimination of 700 others as unnecessary, reducing personnel from 700,000 to 642,000. Congressional committees forbade the personnel reduction and questioned the timing of other changes, but by year's end had apparently acquiesced in plans for significant reforms in all 37 divisions and some 8,800 units of National Guard and Army Reserves. These included, notably: creation of 8 "priority" divisions (raising them to 85% of battle strength with "fillers" assured at call and all weapons and equipment issued); trimming of 6 existing divisions into brigades plus support units plus skeletonized divisional headquarters for mobilization purposes; raising of remaining 23 divisions' enrolled strength, equipment, and training; elimination or reshaping of most of the 1,000 units mentioned above; and establishing higher standards for recruits. Many of these radical changes were scheduled for 1963.

Defense Budget.—Budget planning in 1961–62 was distorted by unpredictable developments, notably by the Berlin crisis. To a much smaller extent, the call-up of reserves, redeployments, and operations associated with the quarantine of Cuba required added funds. The following table is of appropriations, rather than expenditures or authorizations, as providing a more stable basis for comparison.

	Appropriated, fiscal 1962	Requested, fiscal 1963	Appropriated, fiscal 1963
		(millions of dollars)	
Army	$11,996	$11,654	$11,574
Navy	14,745	15,270	15,128
Air Force	19,358	18,926	19,390
Defense Department	1,555	2,057	2,044
Total	$47,654	$47,907[1]	$48,136[1]

[1] Excludes $2,233 million for military construction.

Administration.—In 1962, Secretary of the Army Elvis J. Stahr, Jr., and Secretary of the Navy John B. Connally resigned, and were replaced, respectively, by Cyrus R. Vance and Fred Korth. The reorganization of the Army, along with comparable new concentrations of authority within the Navy and Air Force and the five powerfully centralized agencies of the Defense Department, constitute the largest administrative changes in the department's 14-year history.

NAURU

A United Nations trust territory in the Central Pacific, situated about 2,750 miles southwest of Honolulu, Nauru (area, 8.22 square miles) is administered by Australia on behalf of the joint authority of Australia, Great Britain, and New Zealand. The population (June 30, 1961, est.) is 4,613, including 2,409 Nauruans, 1,077 other Pacific Islanders, 718 Chinese, and 409 Europeans.

The administration of the island is vested in an Australian-appointed administrator (J. Preston White). The Nauruans elect a 9-member council which is responsible

for local government. Government revenue in the fiscal year 1960–61 totaled £A490,233; expenditure, £A486,-214 (the Australian pound equals about U.S.$2.24). Primary and secondary school pupils numbered 1,029 in 1961.

The economy of the island is based on the extraction of phosphate, which is conducted on a nonprofit basis by the British Phosphate Commission, representing the three governments. In 1960–61, 1,338,681 tons of phosphate, valued at £A2,-945,098, were exported, chiefly to Australia and New Zealand. As the phosphate deposits are expected to be depleted in 30 years, the question of a new home for the Nauruans was discussed in July 1962 by the United Nations Trusteeship Council. At that time Hammer de Roburt, the Nauruan head chief, raised the question of Nauruan independence.

NAVY, U.S.

The key position of the U.S. Navy in the Cuban crisis of October overshadowed all other naval developments during 1962. Despite the United States' favorable maritime position and her unchallenged naval power, the Soviet Union undertook a thoroughly planned crash program of building a number of medium- and intermediate-range missile sites in Cuba. The discovery of the missiles, however, was met with determination by the American people and quick reaction by their leaders, who decided first to confront the USSR at sea with a "quarantine" of "proscribed" offensive weapons, meaning missiles and bombing aircraft. With this action went a demand for the removal of offensive weapons already in Cuba, and notice that further military action would follow as the situation warranted.

Adm. George W. Anderson, Jr., chief of naval operations, was made executive agent of the Joint Chiefs of Staff for carrying out the operation. Adm. Robert L. Dennison, commander in chief, Atlantic Fleet, designated a force of about 80 ships under Vice Adm. Alfred G. Ward, commander of the Second Fleet, for the specific task. This force (designated Task Force 136) consisted primarily of carrier and destroyer types, supplemented by land-based aircraft. Available also was part of the Fleet Marine Force, then in the Caribbean, embarked in amphibious ships under command of Puerto Rican-born Vice Adm. Horacio Rivero.

The blockading ships were concentrated mostly in the narrow sea approaches to Cuba. Quarantine procedure involved ordering ships bound for Cuba to heave to; using force if not obeyed; sending a party aboard to inspect for proscribed cargo; and requiring the ship to turn away if such cargo were found.

The first indication of Soviet reaction, following President Kennedy's announcement of quarantine on October 22, was the altered course of some of the 20-plus Soviet bloc ships known to be bound for Cuba. A tanker was allowed to proceed without inspection, but a Lebanese-registered, Soviet-chartered ship was boarded on October 26 by parties from the destroyers *Joseph P. Kennedy, Jr.* and *John R. Pierce*. The freighter's crew cooperated and, when she was found to have none of the proscribed material, the vessel was allowed to proceed.

The blockading force was not the only United States naval strength that the Soviet Union had to consider. At least six Polaris submarines, each with 16 missiles, were deployed at sea, their locations secret. (See also CUBA; INTER-AMERICAN AFFAIRS; UNITED STATES—*The United States in 1962.*)

Naval Matériel.—The Cuban assignment was a relatively easy one for the Navy. Its knotty problem still remains ASW (antisubmarine warfare). PERT (Program Evaluation Review Technique), the computer-supported management system that was employed effectively in the Polaris missile development, is now to be applied to antisubmarine warfare. This is expected to result in some major program revisions, including more demanding contract administration and streamlined but more factual reporting.

Increasing numbers of Asroc and Subroc antisubmarine missiles and Dash drone antisubmarine helicopters are reaching the fleet, and a $1 million Asroc trainer has been set up at the Norfolk Naval Base, Va. Experiments are being conducted in a new main propulsion system for ASW ships which will combine the reliability and cruising radius of the conventional plant with a gas turbine for quick response and maneuverability. VTOL (vertical takeoff and landing) aircraft are being developed to replace the helicopter eventually, and better knowledge of oceanography should lead to improved ASW methods.

(*Left*) The U.S. Navy is continuing the development of hydrofoil ships, such as the *Denison*, which attained speeds in excess of 60 knots on Long Island Sound in November. (*Right*) The A3J Vigilante, the U.S. Navy's newest attack bomber, is seen on the deck of the nuclear-powered supercarrier U.S.S. *Enterprise*, the largest ship in the world.

GRUMMAN AIRCRAFT ENG. CORP.; NORTH AMERICAN AVIATION, INC

UPI

In Washington on October 16, Navy Secretary Fred Korth presents astronaut's wings to Walter Schirra, who orbited the earth six times on October 3, as Schirra's wife looks on.

The year 1962 saw a renaissance in the long-neglected amphibious force. Two new types of surface vessels were added—LPD (amphibious transport dock), an 8,000-ton mobile drydock and helicopter platform; and LPH, a specially built, 18,000-ton helicopter carrier, having a conventional warship hull and flight deck without overhang, and with ample living and storage space for 2,000 troops and their equipment.

Three nuclear-powered surface vessels are now part of the fleet—the carrier *Enterprise,* the cruiser *Long Beach,* and the missile destroyer *Bainbridge* (commissioned on October 6). These ships complete the nuclear-powered surface program, but the submarine program continues. The Navy hopes to increase to 49 the number of Polaris submarines authorized (now 41). The Navy's 13th Polaris submarine, the *Alexander Hamilton,* was launched on August 18. *Thresher,* the first of 14 single-screw, highly maneuverable, deep-diving attack submarines, was commissioned in 1962, as was the tender *Hunley* for servicing Polaris submarines.

In space flight, the Navy's contributions include the Transit satellite for precise ocean navigation, a space surveillance system, and the flight suit worn by the astronauts. For policy reasons, the Navy has not been allowed to convert the relatively inexpensive Polaris to space research. Thus far, however, the Navy's major contribution to space flight has been its men. The three astronauts who made orbits in 1962 were Lt. Col. John H. Glenn, Jr., of the Marine Corps and Lt. Cmdr. M. Scott Carpenter and Cmdr. Walter M. Schirra, Jr., of the Navy. (See also SPACE FLIGHT.)

In other naval matériel developments, progress was made in 1962 with the hydrofoil craft; a continuation of the FRAM (Fleet Rehabilitation and Modernization) program for World War II ships; and a marked trend toward conversion rather than new construction. Prominent in the latter category was the modernization of the 1939 T-2 tankers, which increased capacity from 115,000 to 150,000 barrels and, more important, replaced the present cumbersome fueling-at-sea gear (devised in 1917) with a primarily electrohydraulic system.

Photograph released by the Defense Department on November 9 shows U.S. Navy helicopter observing Soviet submarine in waters near Cuba during October quarantine of the island.

UPI

A budget of $15 billion for the fiscal year 1962 sustained the Navy's strength at 862 ships and 7,200 aircraft.

Naval Personnel.—The problem of training and retention of officers and men continued to be acute in 1962. One out of six men have less than two years' service, and enlistments have been reduced to three years. The response of junior officers to nuclear training has been disappointing. Top Navy leaders are concerned over the morale and retention problems created by long family separations. This was solved in the Polaris submarine program by adoption of a "Blue and Gold" system in which two crews alternate.

The 8,000 Naval Reservists called out in 1961 at the time of the Berlin crisis were released in August 1962, and were not recalled for the Cuban crisis.

Fred Korth was sworn in as secretary of the Navy on Jan. 4, 1962, succeeding John B. Connally, Jr. A major command change in 1962 was the relief of Vice Adm. William A. Schoech as commander of the Seventh Fleet by Vice Adm. Thomas H. Moorer. One of the most significant personnel events of the year concerned a civilian. Dr. Waldo K. Lyon of the Naval Electronics Laboratory was one of six persons to receive the President's Distinguished Federal Civilian Service Medal for his research and development work which made possible submarine navigation under the polar icecap. Characteristically, Mrs. Lyon accepted the award for him because he was in the Arctic, participating on August 22 in the rendezvous and surfacing at the North Pole of the nuclear-powered submarines *Skate,* from the Atlantic, and *Seadragon,* from the Pacific.

JOHN D. HAYES,
Rear Admiral, USN (Ret.).

NEBRASKA

A Central state of the United States, Nebraska ranks 15th among the states in area (land, 76,612 square miles; inland water, 615) and 35th in population (1,484,000 on July 1, 1962, a 5.2% increase from the 1960 census figure of 1,411,330). Urban places with populations above 10,000 in 1960:

Beatrice	12,132	Lincoln (*capital*)	128,521
Columbus	12,476	Norfolk	13,640
Fremont	19,698	North Platte	17,184
Grand Island	25,742	Omaha	301,598
Hastings	21,412	Scottsbluff	13,377
Kearney	14,210		

Government.—Chief executive and judicial officers in 1962 were Frank B. Morrison (Democrat), governor, serving a two-year term; Dwight W. Burney, lieutenant governor; Frank Marsh, secretary of state; Clarence L. E. Swanson, treasurer; Ray C. Johnson, auditor; Clarence A. H. Meyer, attorney general; Floyd A. Miller, commissioner of education; and Robert G. Simmons, chief justice of the 7-member Supreme Court.

The Nebraska Legislature, which convenes in odd-numbered years, is unicameral, consisting of 43 members (nonpartisan) in 1962.

Finance.—In the 1961 fiscal year, revenue of $176,741,571 included $104,932,501 from state taxes and $64,322,453 in federal funds. Chief tax yields were from motor fuels ($43,698,071) and licensing ($8,991,623). Spending of $157,829,204 included $28,662,039 for educa-

tion, $41,238,140 for health, welfare, and safety, and $71,039,512 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 8,818 teachers enrolled 192,372 pupils; junior high schools with 1,600 teachers enrolled 31,054; senior high schools with 3,770 teachers enrolled 68,539; and private and parochial schools with 1,970 teachers enrolled 55,455. College enrollment totaled 33,434 in 21 institutions, including 4 junior colleges and 17 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $125,775,000, including current expenditures of $95 million ($355 per pupil) and capital outlays of $26 million. Revenue of $132.5 million was drawn chiefly from state funds ($7 million) and local districts ($102 million). Teachers' salaries averaged $4,160 (high school, $4,950; elementary, $3,750). Actual spending for higher education (1961 fiscal year) amounted to $25,131,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 29,342 persons totaled $19,080,100. This amount included $12,136,300 for the aged and $4,740,100 for dependent children.

Transportation and Communications.—With 852 miles of highway construction and reconstruction completed in 1961, *highways and roads* on Dec. 31, 1961, totaled 102,552 miles (10,558 surfaced). These served 845,373 *motor vehicles* (as registered on Jan. 1, 1962), including 578,724 automobiles. Operating in the state were (1961) 5 *railroads* (using 8,007 line miles of track); (1962) 5 regularly scheduled *airlines;* and 87 commercial and municipal and 6 state *airports.*

Communications media included (1962) 39 AM and 8 FM *radio stations;* 11 VHF *television stations;* 22 daily *newspapers* (circulation, 488,618) and 232 other newspapers (377,276); and (January 1) 151,200 business and 456,300 residential *telephones.*

Labor Force.—The state's labor force in August 1962 included 180,000 agricultural workers. Nonagricultural employment totaled 459,300, compared with 453,000 a year earlier and an average of 472,100 for the full year 1961. Of nonfarm employees, 21.1% were in trade, 17.1% in government services, and 15.1% in manufacturing. Unemployment in August 1962 stood at 16,000, compared with 19,000 a year earlier.

Manufacturing.—Manufacturing engaged 61,277 workers in 1960, including 44,488 in production, and provided a payroll of $307,325,000. Adjusted value added by manufacture totaled $616,042,000.

LEADING NEBRASKA MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1] (in thousands)
Food and kindred products	27,963	$143,983	$285,765
Electrical machinery	5,096	25,371	48,043
Printing and publishing	5,379	26,279	43,387
Chemicals and products	1,905	10,019	36,566
Fabricated metals	3,744	18,839	33,907
Nonelectrical machinery	3,626	16,177	31,543
Transportation equipment	2,004	10,134	18,269

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Nebraska ranked 28th among the states in the value of its mineral output, with 0.57% of the national total. Mineral fuels contributed 73% of this value.

NEBRASKA MINERAL PRODUCTION, 1961

(In short tons except as noted)

Mineral	Quantity	Value
Clays	146,000	$ 148,000
Natural gas (thousand cu. ft.)	15,743,000	2,629,000
Natural gasoline (1,000 gal.)	...[1]	...[1]
Petroleum (1,000 bbl.)	24,396[2]	69,529,000[2]
Petroleum gases (1,000 gal.)	...[1]	...[1]
Sand and gravel	10,094,000	8,250,000
Stone	3,622,000	6,324,000
Other minerals	...	18,642,000
Total	...	$103,060,000[3]

[1] Figure withheld to avoid disclosing confidential data from an individual company. [2] Preliminary. [3] Total adjusted to eliminate duplication in value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $857,407,000, compared with $876,985,000 for the corresponding period of 1961. For the full year 1961, income comprised $798,212,000 from livestock, $463,588,000 from crops, and $88,560,000 in government payments. Principal income sources in 1961 were cattle, $526,353,000; corn, $198,471,000; hogs, $153,281,000; and wheat, $148,124,000.

The state's 90,000 farms in 1959 had an acreage of 47,756,000 (18,057,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 5,414,000 cattle, 2,648,000 hogs, 733,000 sheep, and 9,708,000 chickens. An average of 132,000 family and 25,000 hired workers engaged in farming in 1961. (See also below, *Events, 1962.*)

NEBRASKA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Beans, dry edible (1,000 bags)	1,049	1,406	1,012
Corn for grain (1,000 bu.)	216,330	275,392	313,357
Hay (1,000 tons)	6,261	6,018	7,222
Oats (1,000 bu.)	44,860	34,144	32,043
Sorghum grain (1,000 bu.)	34,788	59,842	100,100
Soybeans (1,000 bu.)	3,088	7,446	8,370
Sugar beets (1,000 short tons)	880	1,155	945
Wheat (1,000 bu.)	79,161	78,807	53,820

(Source: U.S. Department of Agriculture.)

Events, 1962.—In the November 6 general elections, the Republicans easily won all major offices except that of governor. Frank B. Morrison, Democrat, seeking a second term as governor, defeated former Secretary of the Interior Fred A. Seaton, 242,669 to 221,885. Reelected to Congress were Glenn Cunningham, David Martin, and Ralph Beerman. Earlier, in the Republican primary, Beerman defeated Congressman Phil Weaver in a contest resulting from the redistricting of the state which was made necessary by the loss of one congressional seat.

In the general elections the voters also approved seven constitutional amendments, providing for: removal of restrictions on participation in national lottery or gift enterprises; a Railway Commission of three to seven members to replace the present commission of three members; permission for the lieutenant governor to run for governor during his term; a 4-year term for governor; a 4-year term for state legislators, with half of the membership to be elected every 2 years; a merit plan for selecting judges; and an arrangement whereby in any reapportionment of the Legislature, consideration is to be given to the land area of a district. (Under this formula, 20% to 30% weight is given to area, the remainder to population.)

Total crop production, 2% above the 1961 output, was the fourth highest on record. The yield of winter wheat, the state's second crop, was down approximately 19% from the 1951–60 average, but the 58-bushel-per-acre yield of corn, the leading crop, was the highest in history, and approximately 60% above the 1951–60 average. Irrigation was of major importance in establishing the record. The yield of sorghum grain, a crop which has rapidly increased in significance since World War II, was also the highest on record. Safflower and castor beans, relatively new crops, continued to gain in importance.

Under the leadership of the State Department of Agriculture and the University of Nebraska's College of Agriculture, the state continued the accelerated program of agricultural research which was activated by the 1959 session of the Legislature. A much-discussed result of this program has been the "Nebraskit" group of survival rations, designed for use in fallout shelters.

A nuclear power facility near Lincoln, the first such reactor to be operated by a consumer-owned

utility, began conventional operations in 1962. The organization of the state's public power system, also unique in the nation, continued as a major political issue, as did the question of broadening the tax base through the adoption of an income tax, a sales tax, or both.

Martin Professor and Chairman, Department of History, University of Nebraska.

NECROLOGY, 1962. A selected list of prominent persons who died in 1962 may be found in the NECROLOGY at the back of this volume, immediately following the Z articles. Separate biographies of many prominent persons appear under their own headings throughout the volume; and the names of those who have been given more expansive treatment in the NECROLOGY listing appear in the general Index to this volume.

NEGROES, American. See Index entry.

NEHRU, Jawaharlal

Prime minister of India: b. Allahabad, United Provinces, India, Nov. 14, 1889.

Communist China's open attack on India had a decisive impact on Nehru's domestic and international political position in 1962.

Nehru was educated in England at Harrow, Cambridge University (M.A., 1910), and the Inner Temple, London, where he qualified as a lawyer in 1912. He entered the struggle for Indian independence in 1918, and soon became one of the chief aides of Mahatma Gandhi. In 1929 he succeeded his father, Motilal Nehru, as president of the Indian National Congress, a position he also held in 1936, 1937, 1946, and 1951–54. For his political activities, Nehru was imprisoned by the British for many years, including 1923–26, 1930–33, 1934–35, and 1942–45. In 1947 he became India's first (and only) prime minister and minister of external affairs. In addition, he has been in charge of the Department of Atomic Energy, and was minister of defense (1953–54), and of finance (1956).

The year began auspiciously for the Indian prime minister as he led the Congress Party to another decisive victory in the parliamentary elections on February 16–25. Nehru himself was returned to Parliament by a plurality of 64,571 votes over his nearest opponent. On April 3, members of Parliament of the majority Congress Party unanimously elected him their leader for the next five years. Asked by the president to continue as prime minister, Nehru announced on April 9 an expanded but otherwise little-changed cabinet to serve with him during his fourth term of office.

The election also produced an impressive personal victory for Nehru's close friend and controversial defense minister, V. K. Krishna Menon. Nehru's reappointment of Menon to the cabinet post apparently indicated his at least tacit support for Menon's policy of leaning toward the Communist world while being highly critical of the West.

Nevertheless, Nehru continued to take a firm stand in India's border dispute with Communist China. Declaring on May 3 that Indian troops would continue to hold positions in the Ladakh area threatened by Communist forces, Nehru told Parliament that India was "prepared to meet any step that the Chinese may take" and that the Chinese might be "rather apprehensive of our growing strength." On August 14, Nehru received Parliament's consent to his request for a free hand in dealing with the Communist Chinese.

Refusing to negotiate without a prior Chinese withdrawal, Nehru attended the Commonwealth prime ministers' conference in London (September 10–17), visited France for meetings with President de Gaulle and other officials (September 20–23), and also conferred with the leaders of Nigeria, the United Arab Republic, and Yemen on his return trip to India. On October 20 the Chinese Communists launched a major offensive against India's borders. Indian reverses were attributed by many to Defense Minister Menon's pro-Communist position, which had led to the resignation or removal of many key army officers, and his inadequate provision of modern equipment for the Indian forces. On October 31, Nehru dismissed Menon and took over the defense ministry himself. The prime minister's direct appeals for aid from the West were met promptly. Despite his continued expressions of hope for Russian support, it became increasingly clear as the year ended that Nehru's policy of balancing carefully between East and West was undergoing severe strains.

(See also CHINA; FAR EAST; INDIA.)

NEPAL

This Himalayan kingdom (area, 56,362 square miles; 1961 prelim. census est., 9,753,378) is bordered on the north by Tibet, which Nepal recognizes as an integral part of Communist China; and on the south (for 537 miles) by India (see below, *Events, 1962*). The principal cities are Katmandu, the capital (1958 pop., 195,260), Patan (135,230), and Bhatgaon (84,240).

Government.—Since 1961, when the 1959 constitution was abrogated and Parliament was dissolved, the government has been directed by King Mahendra Bir Bikram Shah Deva (acceded March 14, 1955). In 1962, a 6-member royal commission promulgated a new constitution providing for "basic democracy" through panchayats (village councils); elections were held on February 18 for 160 such councils. Gen. Subarna Shamser, deputy prime minister in the ousted government (Prime Minister B. P. Koirala remaining under arrest), continued to lead the efforts of exiled Nepalese groups in India to return the Nepali Congress to power (see below, *Events, 1962*).

Education and Religion.—About 9% of the population is literate. Educational expenditure, 1961–62: NRs.5,025,000. In 1958, schools numbered 2,740 (English schools, 2,443). Besides the University of Nepal at Kirtipur, there are 18 smaller colleges. The religion of the bulk of the people is Hinduism; other large numbers are Buddhists.

Finance.—Estimated revenue, 1962–63: NRs.289,300,000; expenditure, NRs.297,800,000 (7.6 Nepalese rupees equal U.S.$1). Additional revenue of NRs.30.6 million was expected to accrue from increased land taxes in the Terai region, import duties on luxury items, an embarkation tax on air passengers, and a 10% tax on hotel residents, making current taxation the highest in Nepal's history. Expenditures include NRs.157 million for economic development.

Foreign aid, 1962–63 est.: NRs.128.2 million. The United States furnished NRs.80.3—the highest annual figure since 1952—for development projects in education, transportation, and forestry, and to provide professional training in the United States for 85 Nepalis. India provided NRs.25.1 million to supply drinking water for 400,000 persons in the Katmandu Valley, a child welfare center, and a 20-mile highway between Katmandu and Dakshim Kali. Foreign aid from the Soviet Union and Communist China totaled NRs.16.8 million, and from the United Kingdom and New Zealand, NRs.6.0 million.

Nepal's second three-year development plan came into operation on July 16, 1962. Its total estimated cost is NRs.670 million, of which NRs.100 million is to be derived from internal revenue, NRs.60 million from an internal loan, and NRs.500 million from foreign aid. The largest item of expenditure (NRs.234.5 million) is for the expansion of transport, communications, and electric power.

Transportation and Communications.—Extending from Dhursing into the Katmandu Valley, an 18-mile ropeway, on which about 60 tons of freight is transported daily, was operated from 1961 as a statutory corporation. In 1962 there were 756 miles of motorable roads, and 62 miles of narrow-gauge railways. The Royal Nepal Airlines has services between Katmandu, Patna, and New Delhi; India Airlines also serves Nepal; in 1961 there were 8 airstrips, and 6 others were under construction.

Production and Trade.—Nearly one third of Nepal is under forest (producing revenue of NRs.14,730,000 in 1961–62). Agricultural acreage (1960): 10,877,000 (rice, 6,584,000). Livestock (1960): 7 million cattle, yaks, and buffaloes; 1.75 million sheep and goats; and 14 million poultry. Manufactured products are chiefly jute, sugar, vegetable oils, electric power (a government enterprise which provided revenues of NRs.740,000 in 1961–62), cigarettes, chemicals, and medicinal herbs.

Foreign trade is chiefly with India under a 1960 treaty exempting from duties all goods imported by either country for domestic use. Nepal's imports from the United Kingdom, 1961: £93,682. Exports are agricultural products; imports are principally textiles, cigarettes, petrol, kerosene, machinery, and manufactured goods.

Events, 1962.—At the invitation of Prime Minister Nehru, King Mahendra paid a state visit to India on April 18–23. Their meeting produced a declaration reaffirming the mutual interest of the two countries. The Nepalese monarch, however, protested alleged rebel activities of former Nepalese leaders now living in India, and India's allegedly unfair criticism of events in Nepal. Increasingly large military forces in Nepal were called on during the year to meet guerrilla thrusts at Thori, Bharatpur, Taplejung, Jhapa, and other towns and villages. Gen. Subarna Shumsher, acting president of the ousted Nepali Congress party, announced on November 8 that he was temporarily suspending the rebel movement in view of the Chinese Communist attack on India and the consequent danger facing Nepal. (Some 40,000 Chinese soldiers were reportedly massed along the northern border.)

In November, India reportedly appealed to King Mahendra for Gurkha mountaineer troops in order to strengthen Indian border defenses against further Chinese incursions.

Over intensified objections from New Delhi, the Nepal government held to its plan to build a road, financed with $10 million in Communist aid, between Katmandu and Lhasa, the Chinese-controlled capital of Tibet.

In June a four-man team (three Americans and one Swiss) led by Professor Woodrow Wilson Sayre, grandson of President Wilson, climbed the 25,910-foot, unconquered Gyachung Kang. Sayre reached a point some 500 feet from the summit. Subsequently, after being lost for several days, the party was rescued at an elevation of 17,000 feet.

NERVOUS SYSTEM. See Index entry.

NETHERLANDS

The constitutional monarchy of the Netherlands (or Holland) is situated on the northwest coast of Europe. It has an area of 12,259 square miles, about one fourth of which is below sea level, and a population of 11,775,000 (est. Sept. 1, 1962). Principal cities and populations (est. Jan. 1, 1961): Amsterdam, the constitutional capital, 866,342; Rotterdam, 729,744; The Hague, seat of government, 605,876; and Utrecht, 256,332. Dutch is the official language.

Government.—The Netherlands, with Surinam and the Netherlands Antilles, forms a single realm under the House of Orange. The hereditary constitutional monarch is Queen Juliana of Orange and Nassau (b. 1909; acceded 1948). A coalition cabinet of 13 members (formed May 19, 1959) is headed by Premier Jan Eduard de Quay (Catholic People's Party). The bicameral Parliament (States-General) consists of a First Chamber (75 members elected by provincial councils for six-year terms) and a Second Chamber (150 members elected directly every four years). Political parties and number of seats held in Second Chamber (following elections of March 12, 1959): Catholic People's, 49; Labor, 48; Liberal, 19; Anti-Revolutionary, 14; Christian Historical Union, 12; Political Reform, 3; Communist, 3; and Pacifist Socialist, 2. The highest judicial body is the Supreme Court of Justice.

Education and Religion.—School enrollment (1960–61): 2,934,596. Number of schools (with enrollments), 1960–61: 4,400 infant (397,843); 8,039 elementary (1,460,819); 1,780 secondary (455,736); 1,405 technical (474,915); 429 agricultural (27,324); 558 special (54,561); 93 teacher-training colleges (22,813); 11 universities (40,585). Principal religions: Protestant (approximately 45% of the population); Catholic (40%).

Finance.—Government revenue, 1962 est.: 10,963 million guilders (9,880 million in 1961); expenditure, 11,238 million (9,972 million). The guilder equals U.S.$0.276. National debt: 17,887 million guilders at end of June 1962. Gold and foreign exchange holdings of the Netherlands Bank: $1,775 million as of Aug. 31, 1962.

Transportation and Communications.—Transport networks (miles, 1961): state-owned railways, 2,036 (50% electrified); main roads, 2,830; navigable waterways, 4,232. Merchant marine tonnage (July 1, 1961): 4,910,000 gross registered tons. National airline: KLM, serving 80 countries; 1,374 million passenger-miles (1960). Passenger cars, 512,312 (1961); telephones, 1,613,000 (1961); radio receivers, 3,126,000 (1961); television sets, 923,590 (1961). Daily newspapers: 89 (1961).

Economic Indicators.—Gross national product: 42.35 billion guilders in 1960 (up 9.6% from 1959); 44.35 billion estimated for 1961 (up 5% from 1960). Index of industrial production (1958 = 100): 130 in first 6 months of 1962 (125 in 1961). Cost-of-living index (1958 = 100): 108 in first 6 months of 1962 (104 in 1961). Employment index (1958 = 100): 107 in first 3 months of 1962 (106 in 1961). Registered unemployment averaged 34,000 in 1961 (49,000 in 1960); number of unfilled job openings averaged 120,000 in 1961.

Manufactures and Minerals.—Chief industrial products (metric tons, 1961): crude steel, 1,996,000 (1,940,000 in 1960); pig iron, 1,457,313 (1,347,253); phosphatic fertilizers (1960–61), 223,700 (198,500 in 1959–60); nitrogenous fertilizers (1960–61), 417,500 (406,100 in 1959–60); coal, 12,620,968 (12,498,487); crude oil, 2,046,000 (1,919,000); electric power, 17,521 kw.-hr. (16,516); ship construction, 570,837 gross registered tons (566,993).

Agriculture.—Agriculture accounts for about 10% of the gross national product, and engages some 12% of the labor force. Chief crops (metric tons, 1961): wheat, 482,130 (down 18% from 1960); oats, 431,280 (up 11.5%); barley, 385,077 (up 32.3%); rye, 301,069 (down 34.6%); mixed grains, 161,719 (up 19.6%); sugar beets, 3,854,430 (down 17.5%). Dairy production (metric tons, 1961): milk, 6,953,000 (6,838,000 in 1960); cheese, 212,900 (201,600); butter, 96,600 (99,400).

Foreign Trade.—Total exports, 1961: 15,712.3 million guilders (15,305.4 in 1960); imports, 18,651.5 million (17,216.6 in 1960). Principal exports (in million guilders, 1961): mineral fuels and lubricants, 1,478.7 (1,428.4 in 1960); electrical machinery and apparatus, 1,453.6 (1,325.4); nonelectric machinery, 864.1 (784.4); transportation equipment, 793.6 (761.3); textile goods, 1,129.1 (1,111.2); livestock, meat, and meat products, 822.7 (916.9); dairy products, 1,154.9 (1,242.7). Principal imports: electrical machinery and apparatus, 1,520.8 (1,108.0); nonelectrical machinery, 1,824.4 (1,484.1); textile goods, 1,094.6 (939.9); transportation equipment, 1,320.9 (1,171.2); cereals and cereal products, 773.4 (884.4); iron and steel, 1,124.2 (1,186.2). Chief customers, excluding Belgium-Luxembourg (with percentage of total Dutch exports received, 1961): West Germany (23.1%); United Kingdom (9.9%); France (6.2%); United States (5.5%). Principal suppliers, excluding Belgium-Luxembourg (with percentage of total imports provided, 1961): West Germany (23.0%); United States (11.8%); United Kingdom (7.1%).

Events, 1962.—The economic boom in the Netherlands leveled off with very slight increases in industrial production in 1961 and the first six months of 1962, in comparison with the big jump in industrial production in 1960. A shortage of skilled labor, higher labor costs, and sharper competition were contributing factors. Strong domestic demand for goods and services prompted increased imports,

Wilhelmina, the "old queen," who was reigning monarch of the Netherlands for 50 years, is given a white funeral in accordance with her last wish, at The Hague on December 8.

WIDE WORLD

reducing the balance of payments surplus. There have been efforts to attract more foreign and more married women workers, but the severe labor shortage persists. Nevertheless, investments, including foreign investments, are increasing. Anticipation of advantageous trading in the Common Market area has led to business expansion and reorganization into larger and more efficient units.

Late in 1961 the UN General Assembly rejected a Netherlands offer to place Netherlands New Guinea under a UN trusteeship. In January 1962 there were reports of more Indonesian landings on New Guinea, and military activities in the area increased. The Suez Canal was closed to shipments of armaments destined for use in New Guinea. On permission from the United States, a Dutch plane, carrying military replacements in civilian dress and bound for New Guinea, refueled at several American airfields in the Pacific area. Enraged students demonstrated before the American embassy in Jakarta, and shortly thereafter the United States closed its airport facilities "for the time being" to aircraft carrying Dutch military personnel to New Guinea. Japan refused a landing permit to such aircraft.

Yielding on its position of requiring acceptance of the principle of self-determination for the Papuans as a prior condition to talks, the Dutch offered to negotiate a peaceful settlement. Indonesia countered with expressions of willingness to negotiate, provided there be prior agreement to transfer authority over Netherlands New Guinea to Indonesia. UN Acting Secretary General U Thant continued to urge the two parties to negotiate, as did the United States. In the presence of Ellsworth Bunker, a retired United States diplomat, secret preliminary talks began on March 19. After a few meetings the Indonesian representatives were withdrawn and Indonesian military activities were resumed in considerable strength. Alleging that such action would be viewed as taking sides, Secretary General Thant on May 22 rejected a Netherlands appeal that he urge Indonesia to refrain from aggressive action. He also rejected a renewed Netherlands request for United Nations observers in New Guinea.

Encouraged by President Kennedy, Mr. Bunker submitted proposals in May as the basis for a new round of negotiations. It was alleged that there was considerable pressure on the Dutch to accept the Bunker proposals. Talks were resumed in July, and on August 16 an accord was signed. On October 1, Dutch rule over New Guinea (henceforth known as West New Guinea) came to an end as the United Nations assumed jurisdiction. On May 1, 1963, the administration will be transferred to Indonesia; and in 1969 there will be a plebiscite, under United Nations auspices, to give the Papuans an opportunity to choose their future status. Most of the Netherlanders in West New Guinea have returned to the Netherlands. (See also INDONESIA; WEST NEW GUINEA.)

Princess Wilhelmina (q.v.) died on November 28. She had reigned from 1898 until her abdication in 1948.

AMRY VANDENBOSCH,
Department of Political Science,
University of Kentucky.

NETHERLANDS ANTILLES

Comprising two island groups in the Caribbean, the Netherlands Antilles is an autonomous member of the Kingdom of the Netherlands. The three larger islands—Curaçao (area, 179 sq. mi.; pop., 126,088), Aruba (71 sq. mi.; pop., 57,347), and Bonaire (112 sq. mi.; pop., 5,896)—lie off the coast of Venezuela. The three smaller islands—St. Maarten (of which the northern part, St. Martin, is French), St. Eustatius, and Saba—are situated east of Puerto Rico. The total area is 394 square miles, and the population (Jan. 1, 1962, est.) is 194,316. Dutch is the official language; Spanish and a popular tongue called Papiamento are widely used. Roman Catholicism is the predominant religion of the smaller islands, and Protestantism is dominant in the larger group. Willemstad (pop., 46,000), on Curaçao, is the capital.

Government.—The Netherlands Antilles has full internal autonomy. Matters of common interest are decided together with the Netherlands and Surinam. A Dutch-appointed governor (Nicholas Debrot, appointed in 1962) appoints the Council of Ministers with the approval of the Staten or Legislative Council, whose 22 members are elected by universal suffrage for 4-year terms. Estimated central budget, 1960: revenue, 71.3 million Netherlands Antilles guilders; expenditure, 71.1 million (the NA guilder equals U.S.$0.5305). School enrollment, 1959: primary, 19,616; secondary and vocational, 2,263.

Transportation and Communications.—The Netherlands Antilles in 1960 had about 438 miles of roads; 22,500 motor vehicles, 13,300 telephones, and 39,000 radio receivers. Dr. Albert Plesman Airport on Curaçao and Beatrix Airport on Aruba are the principal airports. A jet airport at Philipsburg, St. Maarten, was under construction in 1962. There is a television station on Curaçao and about 5,000 television sets in the islands.

Production.—The petroleum industry dominates the economy of the islands, employing about 30% of the total labor force. Petroleum is obtained mainly from Venezuela, and is refined at two large refineries on Aruba (owned by an affiliate of the Standard Oil Company of New Jersey) and one refinery on Curaçao (owned by an affiliate of the Royal Dutch Shell Company). Most of the food has to be imported, but some aloes, sorghum, yams, and assorted vegetables are grown. Exports of phosphates from Curaçao totaled about 144,000 metric tons in 1960. Other industries include shipbuilding, tobacco processing, and tourism. Total exports, 1960: 1,241 million NA guilders (mainly to the United States and Great Britain); imports, 1,285 million (mainly from Venezuela).

NEVADA

A Western state of the United States, Nevada ranks 7th among the states in area (land, 109,788 square miles; inland water, 752) and 49th in population (335,000 on July 1, 1962, a 17.3% increase from the 1960 census figure of 285,278). Urban places with populations above 5,000 in 1960:

Carson City (*capital*)	5,163	North Las Vegas	18,422
Elko	6,298	Reno	51,470
Henderson	12,525	Sparks	16,618
Las Vegas	64,405		

Government.—Chief executive and judicial officers in 1962 included Grant Sawyer (Democrat), governor, serving a four-year term; Maude Frazier, lieutenant governor (appointed on July 13 to complete the term of Rex Bell, who died on July 4); John Koontz, secretary of state; Dan W. Franks, treasurer; Charles E. Springer, attorney general; Byron F. Stetler, superintendent of public instruction; and Milton B. Badt, chief justice of the 3-member Supreme Court.

The Nevada Legislature, which convenes in odd-numbered years, comprised 10 Republicans and 7 Democrats in the Senate in 1962 and 32 Democrats and 15 Republicans in the House of Representatives. (In November 1962, reapportionment legislation reduced the number of Representatives to 37.)

Finance.—In the 1962 fiscal year, revenue of $121,404,669 comprised $95,485,071 from state tax sources and $23,832,916 in federal funds. Chief tax yields were the 2% general sales tax ($15,220,000) motor fuel taxes ($9,773,552), and licensing ($9,107,281). Spending of $125,808,221 included $25,658,902 for education, $12,513,137 for health, welfare, and safety, and $27,178,500 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 1,808 teachers enrolled 62,813 pupils; junior-senior high schools with 1,124 teachers enrolled 19,482; and parochial schools with 93 teachers enrolled 2,686. College enrollment totaled 5,235 at the University of Nevada.

Operating expenditures for public elementary and secondary schools in the 1961–62 school year totaled $29,135,851 ($437.50 per pupil) and capital outlays amounted to $1,646,825. Revenue was drawn chiefly from state funds ($18,082,888) and local districts ($10,671,559). Teachers' salaries averaged $6,181 (high school, $6,131; elementary, $5,766). Actual spending for higher education (1961 fiscal year) totaled $7,801,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 7,389 persons totaled $4,348,700. This amount included $2,437,716 for the aged and $1,696,700 for dependent children.

Transportation and Communications.—With 115 miles of highway construction and reconstruction completed in the 1962 fiscal year, *highways and roads* on June 30, 1962, totaled 44,602 miles (4,535 surfaced). These served 157,830 *automobiles* (as registered in the 1962 fiscal year). Operating in the state in 1962 were 4 *railroads* (using 1,644 line miles of track); 8 regularly scheduled *airlines;* and 31 commercial and municipal *airports.*

Communications media included (1962) 1 FM and 18 AM *radio stations;* 5 VHF *television stations;* 8 daily *newspapers* (circulation, 96,000) and 22 other newspapers; and (January 1) 59,100 business and 79,800 residential *telephones.*

Labor Force.—The state's labor force in 1961 included 6,900 agricultural workers. Nonagricultural employment averaged 113,500, compared with an average of 110,100 for 1960. Of nonfarm employees, 32.9% were in service industries, 17.8% in government services, and 17.8% in trade. Unemployment during 1961 averaged 8,700, compared with 7,100 for 1960.

Manufacturing.—Manufacturing engaged 5,305 workers in 1960, including 3,742 in production, and provided a payroll of $30,749,000. Adjusted value added by manufacture totaled $71,894,000. The leading industry was stone, clay, and glass products, which employed 1,142 workers, paid $7,166,000 in wages, and provided $18,754,000 in adjusted value added by manufacture.

Mining.—In 1961, Nevada ranked 32d among the states in the value of its mineral output, with 0.44% of the national total. It was first in output of magnesite and manganese ore; and second in diatomite, mercury, perlite, and sulfur ore.

NEVADA MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Barite	129,524	$ 863,000
Copper (recoverable content of ores)	78,022	46,813,000
Fluorspar	18,129	357,000
Gold (ounces)	54,165	1,896,000
Gypsum	729,000	2,625,000
Iron ore, usable (long tons)	845,000	4,608,000
Lead (recoverable content of ores)	1,791	369,000
Manganese ore	28,573	1,852,000
Mercury (76-pound flasks)	7,486	1,480,000
Perlite	29,544	240,000
Sand and gravel	7,095,000	7,443,000
Silver (ounces)	388,000	359,000
Stone	677,000	1,576,000
Other minerals	...	11,248,000
Total	...	$80,565,000[1]

[1] Total adjusted to avoid duplication in the value of raw materials used in manufacturing cement or lime. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $25,939,000, compared with $23,447,000 for the corresponding period of 1961. For the full year 1961, income comprised $36,354,000 from livestock, $5,871,000 from crops, and $922,000 in government payments. Principal income sources in 1961 were cattle, $27,277,000, and wholesale milk, $5,070,000.

The state's 2,000 farms in 1959 had an acreage of 10,943,000 (338,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 532,000 cattle, and 297,000 sheep.

NEVADA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Alfalfa hay (1,000 tons)	351	336	403
Cotton lint (1,000 bales)	3.2	6.1	6.4
Hay (1,000 tons)	606	523	657
Potatoes (1,000 cwt.)	304	231	448
Wheat (1,000 bu.)	509	354	604

(Source: U.S. Department of Agriculture.)

Events, 1962.—The sudden death on July 4 of Lt. Gov. Rex Bell, former movie star and contender for the governorship on the Republican ticket, changed the complexion of the primary elections. Oran K. Gragson, mayor of Las Vegas, became the Republican candidate by defeating H. M. (Hank) Greenspun, Las Vegas newspaper publisher.

In the general elections on November 6, incumbent Gov. Grant Sawyer easily won over Gragson. Sen. Alan Bible and Rep. Walter S. Baring, Democrats, retained their seats in Congress. The lieutenant governorship went to Paul Laxalt, the only Republican to win a major state office; he defeated Berkeley L. Bunker, Democrat, who was attempting a political comeback.

Constitutional amendments were passed providing for a uniform statewide tax rate for motor vehicles and for the bypassing of the governor and the Legislature in the initiation of petitions for amendments to the constitution. Control of the Senate was retained by the Republicans, whose margin was reduced from three seats to one. Democrats continued to control the Assembly, by 25 to 12; (their margin had been 32 to 15 before the number of seats was reduced in November 1962 by the Reapportionment Act of 1961).

A water shortage in portions of western Nevada was averted by heavy rains in the Sierra Nevadas, caused by a typhoon that struck coastal California, Oregon, and Washington in October. An experiment in permanent weather-modification, a five-year cloud-seeding program, was initiated in the Independence Mountains near Elko.

Northern Humboldt County received the first power from Bonneville Dam to flow into Nevada. The Federal Power Commission approved laying of a natural gas pipeline into the northern part of the state.

The first announced hydrogen bomb test explosion within the United States, the greatest nuclear blast ever to take place in the country, was set off underground on July 6 at Yucca Flats, northwest of Las Vegas. The establishment of a new underground test site near Fallon was revealed by the Atomic Energy Commission. Subject to approval by the same body, a contract was signed for disposal of atomic waste in the desert outside Beatty.

In February the Reese River engulfed much of Battle Mountain, which was declared a disaster area. Reno's historic New Golden Hotel was destroyed by fire on April 3, with the loss of several lives. Construction of a 24-story replacement was begun.

The federal District Court for northern Nevada entertained a suit urging legislative reapportionment of both houses of the Nevada Legislature, particularly the Senate. As a result of building financing practices, Nevada apparently reached the limit of debt established by the constitution.

Both of these matters created an air of anxiety and were being carefully watched by political observers in the state.

"Events" by: ARTHUR J. PALMER, JR., *Assistant to the Legislative Counsel.*

NEW BRUNSWICK

One of the four original provinces of Canada, New Brunswick has an area of 28,354 square miles, of which 519 are fresh water, making it the second largest of the four Atlantic provinces. In the 1961 census, the population was 597,936 (est. July 1, 1962, 608,000), of which 378,633 listed their mother tongue as English and 210,530 as French. The largest religious denomination is Roman Catholic with a membership of 310,607. The 1961 census lists 287,329 persons as members of other denominations, including 94,070 Baptists, 85,710 United Church members, 68,165 Anglicans, and 13,546 Presbyterians. Chief cities, with 1961 populations, are Fredericton, the capital, 19,683; Saint John, 55,153; Moncton, 43,840; Lancaster, 13,848; and Edmundston, 12,791.

Government.—The province is represented in the Canadian federal Parliament by 10 senators (appointed for life), and 10 members (elected) in the House of Commons. The province is nominally administered by a lieutenant-governor (J. Leonard O'Brien, appointed June 6, 1958 to a five-year term). He is advised by a cabinet (headed in 1962 by Louis J. Robichaud) which is drawn from and is responsible to a 52-member House of Assembly. In 1962 the Liberals held 31 seats in the Assembly, the Progressive Conservatives 21.

Finance.—Estimated revenue for the fiscal year 1961–62 was $102,478,450; estimated expenditure, $102,463,176. New Brunswick's funded debt (less sinking funds) and other liabilities was $238,110,144 as of March 31, 1962; the increase in net debt during the year was $7,668,860.

Education.—Education of all children aged 6 to 16 is free and compulsory. Estimated public school enrollment in 1961–62 was 150,024, of which 97,610 were in elementary school, 36,785 in secondary and junior high school, and 15,590 in high school (grades 10–12). Full-time enrollment in New Brunswick's six universities and colleges in 1961–62 was approximately 4,500, the largest number attending the provincial nonsectarian University of New Brunswick at Fredericton. (See also below, *Events, 1962.*)

Transportation and Communications.—New Brunswick is served by both the Canadian National and the Canadian Pacific railways (although 1962 marked the end of passenger service by both lines for the capital city, Fredericton) and by Trans-Canada and Maritime Central airlines. There are 13,363 miles of roads (3,549 miles surfaced). The province has 4 daily newspapers, 11 radio stations, and 2 television stations. There is daily ferry service across the Bay of Fundy between Saint John and Digby, Nova Scotia, and between Tormentine and Borden, Prince Edward Island; there is also a winter passenger service to Great Britain from Saint John. A new bridge between Campobello Island and Lubec, Me. and a new Trans-Canada Highway bridge across the Jemseg River were opened in 1962. Of the total projected 382 miles of Trans-Canada Highway, New Brunswick has completed 220 miles.

Agriculture.—Farms and farmlands are decreasing in number and size in New Brunswick, although the value of farm capital in the province rose to $183.3 million in 1961 from $175 million in the previous year, an increase of 9%. Cash income from sales of farm products decreased to $42,164,000 in 1961 from $47,597,000 in 1960. The number of farms in New Brunswick has decreased from 22,116 in 1956 to 15,571 in 1961. Field crops, including cereal grains and potatoes, together with livestock and pulpwood sales, provide a major part of farm income, although small fruits and poultry are also important.

Forestry and Fisheries.—More than 15.5 million acres —80% of the total land area—of New Brunswick is forested land, about half of which is owned by the crown. There are seven pulp or paper-manufacturing establishments in the province. Pulpwood production for the first eight months of 1962 was 716,966 cords, an appreciable increase from the 600,623 cords in the same period of 1961. Fish landings for the first eight months of 1962 were valued at $5.7 million, compared with $4.8 million for the same period of 1961.

Minerals.—Mineral production in 1961 was valued at $17.8 million, compared with $18.1 million in 1959. Coal production and structural materials accounted for about 45% each of the total. Coal production for the first nine months of 1962 was 617,361 tons, compared with 657,202 tons for the same period of 1961. Peat moss production was valued at $820,000 in 1960.

Power Development.—Production of power by the New Brunswick Electric Power Commission's plants increased 15.1% by March 1962 over the previous year to a total of 1,286,953,430 kw.-hr. Construction began on a 60,000-kw. unit at Newcastle Creek on Grand Lake in 1962. A new addition to the commission's generating capacity, this unit is designed to burn coal from the Minto field and is planned for operation in December 1963.

Industry.—Manufacturing is New Brunswick's leading economic activity, the most important segments being the pulp and paper, fish processing and packing, sawmilling, and miscellaneous food industries. Forestry is the principal primary industry, followed by agriculture. The estimated gross value of factory shipments in 1961 was $373.1 million, up 9.3% from 1960; the January–June 1962 value of $163.8 million, however, was 9.5% lower than the comparable 1961 value.

Events, 1962.—In the national elections of June 18, New Brunswick's citizens elected 6 Liberals and 4 Progressive Conservatives to the House of Commons. Previously New Brunswick was represented in the House by 7 Progressive Conservatives and 3 Liberals. In a provincial by-election, held on December 3, two Progressive Conservatives were elected to fill vacant King's County seats.

Following promulgation of the controversial Liquor Act in May 1962 (passed by the provincial legislature in the 1961 session) the legalized sale of liquor by the glass in hotels, cocktail lounges, private clubs and taverns (in the latter case, for men only) became a reality in New Brunswick.

The Royal Commission on Higher Education in New Brunswick, established in 1961, submitted its report in June 1962. From this first full-scale inquiry in more than a century came recommendations for consolidation of the three French-language institutions into one, to be called the University of Moncton; removal of St. Thomas University from Chatham to the University of New Brunswick campus in Fredericton; and establishment of a second University of New Brunswick campus in Saint John. If the recommendations are carried out, the number of institutions of higher learning in the province would be reduced to the following three: the University of New Brunswick, the University of Moncton, and Mount Allison University. The commission estimated that its plan would cost the provincial government about $3,487,000 in 1962–63, increasing in stages to $4,681,000 in 1966–67.

A New Brunswick Symphony Orchestra, the first provincial symphony organized in Canada, made its debut in November under the direction of Janis Kalnins.

ROBERT FEARON,
Lecturer in History,
University of New Brunswick.

NEW CALEDONIA

A French overseas territory in the western South Pacific, New Caledonia comprises the island of New Caledonia (area, 6,530 square miles) and adjacent island dependencies: the Loyalty Islands (area, 756 square miles), Isle of Pines (52 square miles), Walpole Island, and the Huon, Chesterfield, and Belep islands. The territory's aggregate area is about 7,340 square miles, and the population (1961 est.) totals 78,000. Indigenous Kanakas comprise about 52% of the population; Europeans (mainly French), 34%; Vietnamese, 6%; and Indonesians, 4.5%. Nouméa (est. pop., 23,000) is the capital.

The territory is under a governor (Laurent Péchoux, who is also the high commissioner of the French Republic in the Pacific), assisted by a Government Council and a 30-member Territorial Assembly elected for 5 years by universal suffrage. The government budget for 1960 was balanced at 1,145 million francs CFP; the extraordinary budget totaled 94 million (89.76 francs CFP equal

U.S.$1). There were in 1960 about 18,200 pupils in 123 public and some 100 private schools.

The economy is based on mining and agriculture. Production for export (in metric tons, 1960): nickel ore, 1,013,334; chrome ore, 22,099; nickel matte, 15,521; nickel castings, 46,526; copra, 1,085; green coffee, 1,889; and shell, 160. Exports in 1961 totaled 5,026 million francs CFP (up 9% from 1960); imports, 4,284 million (up 24%). Trade is mainly with France. Nouméa is served by international steamship lines and airlines.

NEW GUINEA. See PAPUA AND NEW GUINEA; WEST NEW GUINEA.

NEW HAMPSHIRE

A New England state of the United States, New Hampshire ranks 45th among the states in area (land, 9,014 square miles; inland water, 290) and 45th in population (632,000 on July 1, 1962, a 4.1% increase from the 1960 census figure of 606,921). Urban places, including towns (T), with populations above 7,000 in 1960:

Berlin	17,821	Laconia	15,288
Claremont	13,563	Lebanon	9,299
Concord (*capital*)	28,991	Manchester	88,282
Dover	19,131	Nashua	39,096
Exeter T.	7,243	Portsmouth	25,833
Goffstown,	7,230	Rochester	15,927
Hanover T.	7,329	Salem T.	9,210
Keene	17,562	Somersworth	8,529

Government.—Chief executive and judicial officers in 1962 included Wesley Powell (Republican), governor, serving a two-year term; Robert L. Stark, secretary of state; Alfred S. Cloues, treasurer; Leonard S. Hill, comptroller; William Maynard, attorney general; Charles F. Ritch, Jr., commissioner of education; and Frank R. Kenison, chief justice of the 5-member Supreme Court.

The New Hampshire General Court, which convenes in odd-numbered years, comprised 18 Republicans and 6 Democrats in the Senate in 1962 and 239 Republicans, 129 Democrats, and 32 others in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $158,165,967 included $43,558,061 from state taxes and $29,632,594 in federal funds. Chief state tax yields were from motor fuels ($14,198,000) and licensing ($17,854,464). Spending of $158,402,850 included $66,058,147 from the general fund, $71,303,913 from the highway fund, and $18,177,681 from the special fund.

Education.—In the 1960–61 school year, public elementary schools staffed by 2,751 teachers enrolled 74,930 pupils; junior high schools with 426 teachers enrolled 8,434; senior high schools with 1,410 teachers enrolled 25,738; and private and parochial schools with 1,447 teachers enrolled 34,405. College enrollment totaled 12,141 in 13 institutions, including 1 junior college and 12 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $50,233,000, including current expenditures of $39,434,000 ($386 per pupil) and capital outlays of $9,559,000. Revenue of $50,708,000 was drawn chiefly from state funds ($2,631,000) and local districts ($38,577,000). Teachers' salaries averaged $4,800 (high school, $5,007; elementary, $4,652). Actual spending for higher education (1961 fiscal year) amounted to $11,008,000.

Public Assistance.—In the 1961 fiscal year, public assistance payments to a monthly average of 9,641 persons totaled $8,192,564. This amount included $5,264,537 for the aged and $2,127,904 for dependent children.

Transportation and Communications.—With 65 miles of highway construction and reconstruction completed in 1961, *highways and roads* on Jan. 1, 1962, totaled 14,097 miles (7,800 surfaced). These served 249,615 *motor vehicles* (as registered between April 1 and Sept. 1, 1962), including 215,513 automobiles. Operating in the state were (1961) 6 *railroads* (using 858 line miles of track); (1962) 2 regularly scheduled *airlines;* and 23 commercial and municipal *airports* and 2 heliports.

Communications media included (1961) 19 AM and 5 FM *radio stations;* 1 *television station;* 9 daily *newspapers* (circulation, 127,385); and (Jan. 1, 1962) 61,000 business and 176,700 residential *telephones.*

Labor Force.—The state's labor force in June 1962 included 9,000 agricultural workers. Nonagricultural employment totaled 220,860, compared with 213,350 a year earlier and an average of 211,390 for the 12 intervening months. Of nonfarm employees, 40.4% were in manufacturing, 16.4% in trade, 15.1% in government services, and 15.1% in service industries. Unemployment dropped to 8,100 in June 1962 from the 12,900 reported a year earlier.

Manufacturing.—Manufacturing engaged 84,069 workers in 1960, including 68,977 in production, and provided a payroll of $342,028,000. Adjusted value added by manufacture totaled $599,002,000.

LEADING NEW HAMPSHIRE MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Leather and products	21,330	$73,610	$109,037
Electrical machinery	9,949	45,917	97,483
Nonelectrical machinery	9,002	46,322	89,312
Textile mill products	12,197	45,557	84,710
Paper and products	5,894	30,303	65,688
Lumber and wood products	5,337	18,032	23,567
Printing and publishing	3,276	14,882	23,130

[1] For definition, see footnote 1 in the article *Industrial Production.*
(Source: *1960 Annual Survey of Manufactures.*)

Mining.—New Hampshire ranked 48th among the states in the value of its mineral production in 1961, with 0.03% of the national total. It was second in output of sheet mica, and fourth in beryllium. Most of the total value of $5,388,000 was accounted for by sand and gravel ($3,627,000).

A new assessment of the thorium reserve in the White Mountains was reported by geologists in late 1962. A "very conservative" estimate of the deposit places it in the tens of millions of tons, revising sharply upward the previous estimates of the supply. Although extraction of the radioactive element is presently uneconomical, and no technology yet exists for the use of thorium in an atomic reactor, the report does assure the United States of a plentiful supply of nuclear fuel into the indefinite future.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $40,346,000, compared with $40,285,000 for the corresponding period of 1961. For the full year 1961, income comprised $43,750,000 from livestock, $10,897,000 from crops, and $793,000 in government payments. Principal income sources in 1961 were wholesale milk, $18,596,000, and eggs, $13,325,000.

The state's 7,000 farms in 1959 had an acreage of 1,124,000 (206,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 101,000 cattle and 1,930,000 chickens.

NEW HAMPSHIRE CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	1,180	1,450	1,400
Corn, sweet (1,000 cwt.)	111	128	135
Hay (1,000 tons)	318	263	250
Maple sirup (1,000 gal.)	47	45	35
Potatoes (1,000 cwt.)	418	333	340

(Source: U.S. Department of Agriculture.)

Events, 1962.—Weakened by a year of bitter factional strife, New Hampshire's dominant Republican Party suffered unexpectedly sharp reverses in the November 6 elections as a revitalized Democratic organization captured both the governorship and the remaining term (four years) of the U.S. Senate seat once occupied by the late Styles Bridges. Heading the breakthrough was John W. King, minority leader in the state House of Representatives, who became New Hampshire's first Democratic governor-elect in 40 years by defeating John Pillsbury, veteran Republican state legislator and utilities company executive, 135,481 to 94,567. Aided in part by King's large plurality,

John King (left), first Democratic governor of New Hampshire since 1924, shares victory with Thomas J. McIntyre, New Hampshire's first Democratic senator in 24 years.

WIDE WORLD

Thomas J. McIntyre, former mayor of Laconia, defeated Republican Congressman Perkins Bass, 117,612 to 107,999, to become the state's first Democratic senator elected since 1932.

Incumbent Gov. Wesley Powell, whose bid for a third-term nomination had been crushed by Pillsbury in the September 11 Republican primary, contributed to his party's setbacks by openly endorsing and campaigning for the Democratic gubernatorial nominee, King. Less dramatic but equally disastrous Republican dissension also wrecked the aspirations of Congressman Bass, whose narrow victory in the Republican primary for the short-term Senate nomination (by a margin of less than 1,700) was viewed by his three defeated opponents with a noticeable lack of enthusiasm. Doloris Bridges, widow of the late senator and runner-up in the hard-fought contest, subjected Bass to a recount and to a hearing before the state Supreme Court for alleged irregularities in the filing of campaign expenditures. Neither Sen. Maurice J. Murphy, Jr., who ran third in the primary, and whose interim appointment by Governor Powell in December 1961 had sparked the first round of intraparty dispute, nor Rep. Chester E. Merrow, who relinquished 20 years of service in the 1st District to run a poor fourth, openly endorsed Bass, and some of their followers reportedly worked for McIntyre in the postprimary campaign.

New Hampshire's traditional Republicanism was evident, however, in all other contests. U.S. Sen. Norris Cotton coasted to reelection by defeating his Democratic opponent, Alfred J. Catalfo, Jr., 135,035 to 90,444. James C. Cleveland, former state senator, scored in the 2d Congressional District over Democratic Eugene S. Daniell, 56,025 to 41,526. In the 1st District, former state Attorney General Louis C. Wyman defeated Oliver J. Huot, Democratic mayor of Laconia, 65,629 to 57,868. Republicans also retained their usual majorities in both houses of the state legislature and in the Governor's Council.

The turbulence of state politics failed to obscure other headline events in 1962, including the arrival, in July, of a contingent of "reverse Freedom Riders" from Louisiana. In November, a new president was selected for the University of New Hampshire. Chosen to fill the university post vacated by Dr. Eldon L. Johnson in August 1961 was Dr. John W. McConnell, dean of the School of Industrial and Labor Relations, Cornell University.

NEW HEBRIDES. See WESTERN PACIFIC ISLANDS, BRITISH.

NEW JERSEY

A Middle Atlantic state of the United States, New Jersey ranks 46th among the states in area (land, 7,521 square miles; inland water, 315) and 8th in population (6,245,000 on July 1, 1962, a 2.9% increase from the 1960 census figure of 6,066,782). Urban places, including urban townships (UT), with populations above 25,000 in 1960:

Atlantic City	59,544	New Brunswick	40,139
Bayonne	74,215	New Hanover (UT)	28,528
Belleville	35,005	Newark	405,220
Bergenfield	27,203	North Bergen (UT)	42,387
Bloomfield	51,867	Nutley	29,513
Camden	117,159	Orange	35,789
Clifton	82,084	Parsippany-Troy Hills (UT)	25,557
Cranford (UT)	26,424	Passaic	53,963
Delaware (UT)	31,522	Paterson	143,663
East Orange	77,259	Pennsauken (UT)	33,771
Edison (UT)	44,799	Perth Amboy	38,007
Elizabeth	107,698	Plainfield	45,330
Englewood	26,057	Rahway	27,699
Ewing (UT)	26,628	Ridgewood	25,391
Fair Lawn	36,421	Teaneck (UT)	42,085
Garfield	29,253	Trenton (*capital*)	114,167
Hackensack	30,521	Union City	52,180
Hamilton (UT)	65,035	Union (UT)	51,499
Hoboken	48,441	Vineland	37,685
Irvington	59,379	Wayne (UT)	29,353
Jersey City	276,101	Westfield	31,447
Kearny	37,472	West New York	35,547
Linden	39,931	West Orange	39,895
Long Branch	26,228	Woodbridge (UT)	78,846
Middletown (UT)	39,675		
Montclair	43,129		

Government.—Chief executive and judicial officers in 1962 included Richard J. Hughes (Democrat), governor, serving a four-year term; Robert J. Burkhardt, secretary of state; John A. Kervick, treasurer; Frank Durand, auditor; Arthur J. Sills, attorney general; Frederick M. Raubinger, commissioner of education; and Joseph Weintraub, chief justice of the 7-member Supreme Court.

The New Jersey Legislature, which convenes annually, comprised 10 Republicans, 10 Democrats, and one vacancy in the Senate in 1962 (see also below, *Events, 1962*) and 38 Democrats and 22 Republicans in the General Assembly.

Legislation, 1962.—The New Jersey Legislature approved a budget of $449,401,711 for the fiscal year ending June 30, 1963. To meet the cost of special appropriations for shore rehabilitation programs (see below, *Events, 1962*), the state's horse racing season was lengthened and the inheritance tax increased. The tax begins at 1% on amounts from $5,000 to $15,000 and increases to 16% on amounts over $3,200,000.

From funds made available by a 1960 bond issue, over $33 million was appropriated for the construction of mental and correctional institutions. The two largest projects authorized were a new 1,000-patient institution for the mentally retarded at Woodbridge and a medium-security prison at Leesburg.

Counties were authorized, either independently or jointly, to establish county colleges whose programs of instruction would be limited to two years beyond high school. Within the limits of available funds, state financial support was authorized to provide 50% of the cost of capital projects and one third of the operational cost or $200 for each full-time student.

The state's civil rights law was amended to prohibit discrimination against the aged. Other significant measures to be approved included: the requirement of a fiscal note indicating the cost of any legislative proposal affecting state revenues or expenditures; an increase (from 15%) to 35% in the proportion of state college scholarships which may be used out of state; the creation of the New Jersey Expressway Authority; authorization of counties and municipalities to enter into regional councils; and ratification of the proposed amendment to the U.S. Constitution outlawing poll taxes as a requirement for voting. The Port of New York Authority was authorized to acquire and expand the Hudson Tubes of the Hudson and Manhattan Railroad as part of a planned New York–New Jersey rapid transit system.

Finance.—In the 1961 fiscal year, revenue of $862,052,000 included $385,666,000 from state taxes and $112,826,000 in federal funds. Chief tax yields were from motor fuels ($100,125,000), licensing ($117,182,000), and corporate incomes ($26,350,000). Spending of $770,244,000 included $165,667,000 for education, $79,684,000 for health, welfare, and correction, and $141,349,000 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 28,095 teachers enrolled 748,206 pupils; junior high schools with 5,587 teachers enrolled 84,267; junior-senior high schools with 15,074 teachers enrolled 271,225; and parochial schools with 7,914 teachers enrolled 298,530. College enrollment (as of March 1, 1962) totaled 95,604 in 62 institutions, in-

cluding 9 junior colleges, 28 senior colleges and universities, and 25 other institutions.

Estimated public school spending in the 1961–62 school year totaled $679.2 million, including current expenditures of $535 million ($528 per pupil) and capital outlays of $115 million. Revenue of $728 million was drawn chiefly from state funds ($143 million) and local districts ($470 million). Teachers' salaries averaged $6,104 (high school, $6,310; elementary, $5,990). Actual spending for higher education (1961 fiscal year) comprised $30,160,806 for operations and $11,143,042 for construction and improvements.

Public Assistance.—In the 1961 fiscal year, public assistance payments to a monthly average of 107,357 persons totaled $47,973,000. This amount included $16,337,000 for the aged and $24,451,000 for dependent children.

Transportation and Communications.—With 10 miles of new state highway construction completed in 1961, *highways and roads* on Dec. 31, 1961, totaled 32,330 miles (27,910 surfaced). These served 2,607,453 *motor vehicles* (as registered on July 1, 1961), including 2,212,-441 automobiles. Operating in the state in 1961 were 22 *railroads* (using 1,973 line miles of track); 10 regularly scheduled *airlines;* and 70 commercial and municipal *airports.*

Communications media included (1962) 28 AM and 19 FM *radio stations;* 33 daily *newspapers* (circulation, 2,446,130) and 221 other newspapers (856,701); and (January 1) 808,400 business and 2,311,100 residential *telephones.*

Labor Force.—The state's labor force in August 1962 included 2,087,100 nonagricultural employees, compared with 2,053,300 a year earlier and an average of 2,042,900 for the 12 months ending June 1962. Of nonfarm employees in August 1962, 38.5% were in manufacturing, 18.6% in trade, and 13.8% in service industries. Unemployment in August 1962 stood at 156,000, compared with 173,000 for the previous August.

Manufacturing.—Manufacturing engaged 813,-832 workers in 1960, including 579,082 in production, and provided a payroll of $4,473,910,000. Adjusted value added by manufacture totaled $8,-564,659,000.

LEADING NEW JERSEY MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1]
Chemicals and products	80,802	$516,581	$1,655,721
Electrical machinery	117,425	674,621	1,086,583
Food and kindred products	54,429	323,753	945,539
Transportation equipment	51,202	331,542	603,389
Fabricated metals	55,673	309,621	571,731
Nonelectrical machinery	56,961	350,771	570,825
Primary metals	37,842	223,097	404,609
Apparel and related products	75,090	234,623	383,966
Printing and publishing	32,915	184,221	340,774
Stone, clay, glass products	33,584	168,578	326,536
Instruments and related products	29,892	190,036	325,660

[1] For definition, see footnote 1 in the article *Industrial Production.*
(Source: *1960 Annual Survey of Manufactures.*)

Fisheries.—The commercial fish and shellfish catch in 1961 totaled 397,223,485 pounds valued at $10,882,682. Leading species were menhaden (329,372,143 pounds valued at $3,643,866) and clams (28,370,635; $2,412,529).

Mining.—In 1961, New Jersey ranked 37th among the states in the value of its mineral production, with 0.33% of the national total. Its 1961 total of $59,208,000 was 5% over that of 1960. Leading minerals were stone (valued at $24,-539,000) and sand and gravel ($20,895,000).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $220,541,000, compared with $223,913,000 for the corresponding period of 1961. For the full year 1961, income comprised $156,726,000 from livestock, $130,841,000 from crops, and $3,527,-000 in government payments. Principal income sources in 1961 were eggs, $66,298,000; wholesale milk, $56,372,000; and tomatoes, $15,925,000.

The state's 15,000 farms in 1959 had an acreage of 1,379,000 (658,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 196,-000 cattle, 165,000 hogs, and 10,925,000 chickens. An average of 27,000 family and 17,000 hired workers engaged in farming in 1961.

NEW JERSEY CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	2,845	3,000	3,100
Asparagus (1,000 cwt.)	735	685	658
Cabbage (1,000 cwt.)	499	608	576
Corn, sweet (1,000 cwt.)	883	1,012	1,050
Corn for grain (1,000 bu.)	6,718	5,772	5,694
Lettuce (1,000 cwt.)	819	634	753
Peaches (1,000 bu.)	2,044	1,700	2,600
Peppers (1,000 cwt.)	441	480	507
Potatoes (1,000 cwt.)	3,966	4,845	4,335
Strawberries (1,000 lb.)	9,667	14,580	14,000
Sweet potatoes (1,000 cwt.)	1,370	1,350	1,750
Tomatoes (1,000 cwt.)	806	924	825

(Source: U.S. Department of Agriculture.)

Events, 1962.—New Jersey moved a step nearer to the adoption of a broad-based tax with the release in January 1963 of a long-awaited report by the Commission on State Tax Policy. In April, the Legislature had directed the commission to re-examine the entire tax structure with a view to insuring "a fair and equitable distribution of the costs of governmental services." Following a series of public hearings, and after extensive deliberation, the commission recommended enactment of a 3 percent sales tax to apply to all purchases except food and prescription drugs.

Storms and flooding along the shore in early March caused damage estimated at over $80 million. Of this sum, private property damage amounted to $45 million and public property damage to $35 million, including beaches, roads, bridges, and sewers. Homes that had been considered entirely safe from flooding were completely destroyed, often leaving the owner with no tangible evidence of his property other than the continuing payments on his mortgage.

The Army Engineers moved millions of tons of sand to damaged beaches. In August, Governor Hughes reported that the federal Office of Emergency Planning had approved aid amounting to $6.6 million for the purpose of rebuilding public facilities. The state Legislature appropriated $2.5 million for disaster relief to be distributed to counties and municipalities on a 50–50 matching basis. An additional $4 million was appropriated, also on a matching basis, for beach erosion projects.

The election of a senator in Union County attracted statewide attention. Early in the year, by a vote of 11–10, the Republicans had organized the Senate. Shortly afterward, owing to ill health, Sen. Robert C. Crane resigned. Thus, on the election to fill this one vacancy hinged control of one house of the state Legislature. In an especially

Section of the main street of Brigantine, N.J., an island suburb of Atlantic City, is leveled by ocean waves driven inshore during the disastrous Atlantic storm of March 6–8.

WIDE WORLD

spirited contest, Republican Assemblyman Nelson F. Stamler defeated his Democratic opponent, H. Roy Wheeler, former mayor of Linden.

In the congressional elections eight seats were won by Republicans and seven by Democrats. The record off-year turnout of 2,018,321 voters constituted 64 percent of those registered.

Efforts of a House Judiciary subcommittee to compel the production of subpoenaed records of the Port of New York Authority failed when the U.S. Supreme Court refused to review a decision of the Court of Appeals. Austin J. Tobin, executive director of the Port Authority, with the backing of the governors of both New York and New Jersey, had declined to submit internal administrative records requested by the congressional investigating committee. After prolonged litigation, Tobin was convicted of contempt of Congress. In June, the conviction was reversed by the U.S. Court of Appeals, and the case was closed in November when the Supreme Court denied the Justice Department's petition for review.

Milk price controls were suspended by the governor in mid-October following repeated expressions of dissatisfaction by various groups over the prices established by the state's Office of Milk Industry. The drop in prices which occurred after the suspension of controls led to the extensive cancellation of contracts by milk dealers who said they could no longer afford to purchase from New Jersey farmers. In an effort to prevent chaos in the industry, rural legislators persuaded the governor to agree to legislation re-establishing price controls during a 180-day moratorium, during which an analysis of costs would be made and more effective systems of accounting and enforcement established. Pending completion of this study, new lower statewide minimum prices would prevail (effective December 10), and dealers would be required to maintain their contracts.

NEW MEXICO

A Southwestern state of the United States, New Mexico ranks 5th among the states in area (land, 121,510 square miles; inland water, 156) and 36th in population (1,020,000 on July 1, 1962, a 7.2% increase from the 1960 census figure of 951,023). Urban places with populations above 15,000 in 1960:

Alamogordo	21,723	Hobbs	26,275
Albuquerque	201,189	Las Cruces	29,367
Carlsbad	25,541	Roswell	39,593
Clovis	23,713	Santa Fe (*capital*)	33,394
Farmington	23,786		

Government.—Chief executive and judicial officers in 1962 included Edwin L. Mechem (Republican), governor, serving a two-year term (see below, *Events, 1962*); Tom Bolack, lieutenant governor; Betty Fiorina, secretary of state; Joe Callaway, treasurer; Robert D. Castner, auditor; Earl E. Hartley, attorney general; Tom Wiley, superintendent of public instruction; and James C. Compton, chief justice of the 5-member Supreme Court.

The New Mexico Legislature, which convenes in odd-numbered years, comprised 28 Democrats and 4 Republicans in the Senate in 1962 and 59 Democrats and 7 Republicans in the House of Representatives.

Legislation, 1962.—The certainty of a sizable school fund deficit caused Governor Mechem to call the Legislature into special session on February 12–24. The lawmakers were presented with two proposals for school aid: the "Mort Plan" of the State Department of Education for state and local support on a partnership basis; and the administration "Gott Plan" for a comprehensive overhaul of school finances, mandatory consolidation of small districts, and legislative control over educational procedures.

A compromise omnibus bill was adopted. A total budget of $91,500,000, with the state's share set at $80,640,000, provided for a support level of $270 per student based on weighted average daily membership. Mandatory consolidation of county school systems having 1,500 pupils or less with adjacent municipal units was included, but not legislative control over curriculum or educational procedures. Relations between the Republican governor and the Democratic Legislature were harmonious until the governor's final message—received on the closing day of the session—sharply criticized the revenue measures as inadequate and demanded a temporary 50% increase in the sales tax. Continued advocacy of the sales tax increase was a major factor in the defeat of Mechem on November 6 (see below, *Events, 1962*).

Other legislation included: authority to transport underground water outside the state; appropriation for a study of capitol expansion; and provision for quarterly rather than monthly payments of some taxes. Defects in acts passed in 1961 were remedied, including the allocation of increased cigarette taxes to the general fund and the withholding of income tax from nonresidents.

Finance.—In the 1961 fiscal year, revenue of $337,091,897 included $87,722,594 from state taxes and $58,373,547 in federal funds. Chief tax yields were the 2% general sales tax ($38,433,171), motor fuel taxes ($25,840,300), and licensing ($16,019,310). Spending of $332,536,103 included $48,531,242 for education, $30,011,279 for health, welfare, and safety, and $56,730,963 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 5,220 teachers enrolled 150,439 pupils; secondary schools with 3,646 teachers enrolled 100,305; and parochial schools with 824 teachers enrolled 23,641. College enrollment totaled 19,253 in 9 institutions, including 1 junior college and 8 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $92.1 million, including current expenditures of $80 million ($361 per pupil) and capital outlays of $10 million. Revenue of $104,582,000 was drawn chiefly from state funds ($71,947,000) and local districts ($12,135,000). Teachers' salaries averaged $5,650 (high school, $5,790; elementary, $5,500). Actual spending for higher education (1961 fiscal year) totaled $32,061,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 283,000 persons totaled $23,225,000. This amount included $11,158,000 for dependent children and $9,103,000 for the aged.

Transportation and Communications.—An aggregate of 245 miles of highway construction and reconstruction were completed in the 1962 fiscal year. *Highways and roads* on Jan. 1, 1962, totaled 63,510 miles (9,772 surfaced). These served 439,929 *motor vehicles* (as registered on June 30, 1962), including 305,287 automobiles. Operating in the state were: (1962) 6 *railroads* (with a 2,500-mile right of way); (1961) 3 regularly scheduled *airlines;* and 57 commercial and municipal *airports.*

Communications media included (1961) 1 FM and 44 AM *radio stations;* 7 *television stations;* 19 daily *newspapers* (circulation, 188,072) and 43 other newspapers; and (Jan. 1, 1962) 116,600 business and 198,700 residential *telephones.*

Labor Force.—The state's labor force on Dec. 31, 1961, included 158,230 nonagricultural workers, compared with 155,792 a year earlier and an average of 157,690 for the 12 intervening months. Of nonfarm employees, 31% were in trade, 19% in service industries, and 13% in mining and quarrying. Unemployment on Dec. 15, 1961, totaled 7,900, compared with 8,668 a year earlier.

Manufacturing.—In 1961 an average of 16,200 persons were employed in manufacturing establishments, receiving a total payroll of $83,669,073. The 1960 average was 13,672 workers, including 9,326 in production; the total payroll amounted to $65,820,000; and adjusted value added by manufacture totaled $122,856,000.

Leading industries in 1960 were food and kindred products (3,687 workers, receiving $14,666,000 in wages, and adding $31,678,000 in adjusted value by manufacture) and stone, clay, and glass products (1,367; $6,853,000; $14,703,000).

Mining.—New Mexico ranked sixth among the states in the value of its mineral output in 1961, with 3.80% of the national total. It was first in output of carbon dioxide, perlite, potassium salts, and uranium; second in manganiferous ore; and third in beryllium, helium, and pumice.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $110,446,000, compared with $100,093,000 for the corresponding period of 1961. For the full year 1961, income comprised $151,290,000 from livestock, $89,151,000 from crops,

NEW MEXICO MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Coal	412,000	$ 2,477,000
Copper (recoverable content of ores)	79,606	47,764,000
Gypsum	105,000	386,000
Helium (1,000 cu. ft.)	42,224	762,000
Lead (recoverable content of ores)	2,332	480,000
Lime	25,000	350,000
Natural gas (1,000 cu. ft.)	789,662,000	86,073,000
Natural-gas liquids (1,000 gal.)	958,155	42,773,000
Perlite	245,654	2,159,000
Petroleum (1,000 bbl.)	112,083[1]	320,784,000[1]
Potash (K_2O equivalent)	2,523,000	96,380,000
Pumice	339,000	879,000
Salt	33,000	284,000
Sand and gravel	12,523,000	10,049,000
Silver (fine ounces)	283,000	261,000
Stone	1,853,000	2,206,000
Uranium ore	3,631,036	62,482,000
Zinc (recoverable content of ores)	22,900	5,267,000
Other minerals	...	7,739,000
Total	...	$688,908,000[2]

[1] Preliminary. [2] Total adjusted to eliminate duplication in the value of raw materials used in the manufacture of cement and lime. (Source: U.S. Bureau of Mines.)

and $14,120,000 in government payments. Principal income sources in 1961 were cattle, $121,279,000; cotton lint, $39,660,000; wholesale milk, $11,554,000; and wheat, $11,515,000.

The state's 16,000 farms in 1959 had an acreage of 46,293,000 (1,077,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,221,000 cattle, 1,191,000 sheep, and 942,000 chickens.

NEW MEXICO CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	564	370	380
Cotton lint (1,000 bales)	296	300	275
Cottonseed (1,000 tons)	122	124	114
Hay (1,000 tons)	542	723	796
Onions (1,000 cwt.)	367	603	532
Pecans (1,000 lb.)	4,228	4,650	7,500
Sorghum grain (1,000 bu.)	4,998	9,310	10,152
Wheat (1,000 bu.)	2,089	8,004	4,200

(Source: U.S. Department of Agriculture.)

Events, 1962.—Jack M. Campbell, Roswell attorney and former speaker of the state House of Representatives, won 53% of the vote for governor to defeat Republican incumbent Edwin L. Mechem in the November elections. Democratic U.S. Representatives Joseph M. Montoya and Thomas G. Morris also won, as Democrats captured all state and most county posts. Voters also passed a constitutional amendment providing for future elections of governor and lieutenant governor from the same party.

Mechem resigned as governor on November 30 in favor of Lt. Gov. Tom Bolack, and was immediately appointed by Bolack to fill the unexpired term of senior U.S. Sen. Dennis Chavez, who had died suddenly on November 18. Chavez, fourth-ranking member of the Senate, was chairman of the Public Works Committee and member of both the Appropriations and the Military Affairs committees.

Economic conditions, especially in the depressed northern counties, were eased somewhat by federal funds to improve recreation facilities in national forests, by the completion of several dams in the Santa Cruz Watershed Project, and by the creation of the Pojoaque Watershed District. The Northern New Mexico Resources Development Association was organized to plan resource utilization. The $42 million Navajo Dam on the San Juan River, the first major unit of the Colorado River Storage Project, was dedicated on September 15 (see also DAMS).

A cold dry spring, summer drought, and hail throughout much of the state caused a sharp decline in agricultural production, except for pecans and peanuts. Fall precipitation, however, improved grazing lands, and stock production was nearly normal. An outbreak of anthrax among Taos Indian Pueblo stock in November necessitated a quarantine of all Taos County livestock. Uranium and potash production declined, the latter partly because of a crippling two-month summer strike.

Restrictions on federal highway funds (resulting from the 1961 Blatnik subcommittee's unfavorable report of political influence and construction malpractices) were lifted after reforms were effected.

The Legislature met in a special February session to deal with the crisis in school financing (see above, *Legislation, 1962*).

The mounting school population aggravated the already acute problem of educational finance. Pueblo Indian leaders sharply criticized the Bureau of Indian Affairs for transforming the Santa Fe Indian School into a special Institute of American Art for gifted students when basic educational facilities for Indian children were still inadequate. The successful training of 85 students for Peace Corps service in Latin America prompted the University of New Mexico to expand the program, and the Pueblo of Acoma requested that impoverished Indian reservations be included in the Peace Corps program.

The Atomic Energy Commission was authorized, on September 29, to dispose of all government property not directly involved in atomic energy projects in the federal city of Los Alamos. Present occupants will be given priority in purchasing homes and stores, and municipal facilities will be donated to the new city government. On November 21 a $3,500,000 Air Force Nuclear Effects Research Laboratory was dedicated at Kirtland Air Force Base, Albuquerque.

NEW ORLEANS

The state's principal city, New Orleans, La., covers a land area of 198.8 square miles and a water area of 164.7. Its 1960 population of 627,525 ranked New Orleans 15th in the United States and 5th in the South. The metropolitan area (1,769.5 sq. mi., of which 1,118 is land) had a 1960 population of 868,480, including 240,955 residents of St. Bernard and Jefferson parishes.

The city has a strong mayor-council government. Mayor Victor H. Schiro, a Democrat, is serving his first four-year term, having been inaugurated on May 7, 1962. A chief administrative officer, serving at the mayor's pleasure, is delegated much administrative authority. The City Council is composed of seven members serving four-year terms, five of whom are elected from districts and two elected at-large.

City financial data (1962): operating budget, $34,148,380; capital budget, $12,597,197; long-term general obligation bonded debt, $90,532,000; water revenue bonded debt, $7,584,000; and a special 2-mill tax bonded debt for sewerage, water, and drainage, $4,000,000. A 34.5 mill tax is collected, of which the city receives 9.5 mills on a base of 85% of assessed value, and the public school system receives 13 mills on a 100% base.

Economic data (1961): employment, 317,000; unemployment, 21,950; metropolitan retail sales, $1,044 million; value of building permits, $70,017,475.

Across its more than 62 miles of wharves, the Port of New Orleans in 1961 handled foreign trade totaling 13 million tons, valued at $1.79 billion. Exports were up 15% in tonnage and 4% in dollar value; imports were down 17% in tonnage and 3% in value. A total of 4,738 deep-draft vessels called at the port. Almost 210 million bushels of grain were exported, making New Orleans one of the world's leading grain ports. During 1961 more export railroad cars (125,874) of cargo were unloaded than at any other port in the nation.

WIDE WORLD

Women cheer as white parents withdraw their children from a newly desegregated school in New Orleans, September 6.

Because of its outstanding contribution to United States export expansion, the Port of New Orleans, on May 4, 1962, became the first in the nation to receive the President's "E" Certificate of Service. At the dedication of a new $10 million wharf marking the occasion, President Kennedy delivered a major foreign trade policy speech.

By mid-1962, dredging work on the Mississippi River-Gulf outlet was about half completed and plants were locating along its route. (See also CANALS.)

The National Aeronautics and Space Administration and the prime contractors, Boeing and Chrysler, were vigorously preparing for production of the first stage of the Saturn rocket, as well as larger rocket boosters to be produced and assembled at the Michoud Ordnance plant, located in eastern New Orleans. A static testing area will be located in nearby Mississippi.

In accordance with the grade-a-year desegregation program ordered by a federal court two years ago, 106 Negroes were enrolled in New Orleans public schools by the fall of 1962. The Roman Catholic Archdiocese of New Orleans desegregated its primary and secondary schools for the first time during the year. (Since no record of race is kept in the Catholic schools, Negro enrollment there was not reported.) Within the city, growing acceptance of desegregation was the rule, and calm prevailed. Desegregation of chain-store lunch counters in the fall of 1962 also occurred peacefully.

Mayor Victor H. Schiro, appointed to the office the previous year, won election in his own right in 1962. He easily defeated State Sen. Adrian G. Duplantier in a run-off Democratic primary on March 3 and Republican E. Ross Buckley in the election of April 3.

WILLIAM W. SHAW,
Professor of Political Science, Tulane University.

NEW YORK

A Middle Atlantic state of the United States, New York ranks 30th among the states in area (land, 47,939 square miles; inland water, 1,637) and first in population (17,402,000 on July 1, 1962, a 3.7% increase from the 1960 census figure of 16,782,304). Cities, villages, and unincorporated places (U) with populations above 25,000 in 1960:

Albany (*capital*)	129,726	Elmont (U)	30,138
Amsterdam	28,772	Franklin Square (U)	32,483
Auburn	35,249	Freeport	34,419
Baldwin (U)	30,204	Hempstead	34,641
Binghamton	75,941	Hicksville (U)	50,405
Buffalo	532,759	Ithaca	28,799
Cheektowaga-Northwest (U)	52,362	Jamestown	41,818
East Meadow (U)	46,036	Kingston	29,260
Eggertsville (U)	44,807	Lackawanna	29,564
Elmira	46,517	Levittown (U)	65,276
		Lockport	26,443
Long Beach	26,473	Rockville Centre	26,355
Massapequa (U)	32,900	Rome	51,646
Mount Vernon	76,010	Schenectady	81,682
Newburgh	30,979	Syracuse	216,038
New Rochelle	76,812	Tonawanda (U)	83,771
New York City	7,781,984	Troy	67,492
Niagara Falls	102,394	Utica	100,410
North Tonawanda	34,757	Valley Stream	38,629
Oceanside (U)	30,448	Wantagh (U)	34,172
Plainview (U)	27,710	Watertown	33,306
Poughkeepsie	38,330	White Plains	50,485
Rochester	318,611	Yonkers	190,634

Government.—Chief executive and judicial officers in 1962 included Nelson A. Rockefeller (Republican), governor, serving a four-year term; Malcolm A. Wilson, lieutenant governor; Mrs. Caroline K. Simon, secretary of state; Arthur Levitt, comptroller; Louis J. Lefkowitz, attorney general; James E. Allen, Jr., commissioner of education; and Charles S. Desmond, chief judge of the 7-member Court of Appeals.

The New York Legislature, which convenes annually, comprised 33 Republicans and 25 Democrats in the Senate in 1962 and 84 Republicans and 66 Democrats in the Assembly.

Legislation, 1962.—The Legislature passed 1,278 bills during its regular session (January 3–March 31) out of a record total of 9,159 bills introduced (322 more than in 1961). Of these, the governor vetoed 265. The major enactments included the following:

Budget and Taxation.—Approved the spending of $2,591,000,000 for the fiscal year 1962–63, plus $78,000,000 in supplemental budgets. Abandoned the 10% state income tax rebate authorized in 1961. Accelerated collection dates of corporation franchise and bank taxes to produce $90,000,000 more revenue in 1963. Authorized New York State residents working out of state to deduct from their New York State income tax indebtedness any payments made in the state in which they work; revised nonresident income tax laws to prohibit out-of-state residents working in New York from deducting taxes paid their home state from their New York obligation.

Education.—Revised the formula for allocation of state funds to local school districts, thus increasing state aid for the school year 1962–63 by $121 million, of which sum the City of New York received $48 million. Established a construction fund for the State University of New York. Increased the minimum salary for teachers from the existing $4,200–$6,200 range to $4,500–$6,800.

New York City.—Approved the transfer of residential rent control from the state to the city. Empowered the city to acquire the Fifth Avenue Coach Company bus lines by condemnation and to operate their routes through a subsidiary of the Transit Authority. Approved advance in payment dates of gross receipts taxes to produce an estimated $50 million in additional revenue for the 1962–63 fiscal year. Authorized the city to build a World Trade Center in Manhattan and to acquire and rehabilitate the Hudson and Manhattan Railroad.

Housing and Rents.—Established a broad program to increase substantially the number of apartments available for middle- and low-income families. Retained jurisdiction of rent control by the state in areas outside of New York City. Empowered welfare departments to withhold rent payments on behalf of rent clients in tenements with building violations.

Health and Welfare.—Adopted a program for expanding and improving the treatment of the mentally ill. Provided increased aid to narcotic addicts and medical assistance for the aged. Repealed a law that banned localities from requiring the dating of milk.

Court System.—Adopted a new Civil Practice Law and Rules. Approved 22 bills implementing the new judiciary article in the state constitution (approved by the voters in the November 1961 election) which established a unified court system, effective Sept. 1, 1962. Increased salaries of various judges and increased the number of Supreme Court justices and Court of Claims judges. Established in New York City new Civil, Criminal, and Family courts.

Labor and Industry.—Increased the state minimum wage to $1.15 effective Oct. 15, 1962, and to $1.25 effective Oct. 15, 1964. Raised maximum cash payments due under workmen's compensation from $50 to $55 weekly for on-the-job injuries and deaths. Granted a 5% increase to all state employees, except elected officials. Established the State Atomic Research and Development Authority to promote new jobs and industrial opportunities.

Civil Rights.—Reorganized the State Commission against Discrimination, including a change of name to the State Commission for Human Rights. Outlawed racially restrictive covenants in mortgages, leases, deeds, or other transfers of property. Included motels, swimming pools, and other public accommodations in the ban against discrimination.

Miscellaneous.—Appropriated $20 million to buy property in downtown Albany for a new state government center. Authorized a new $25 million bond issue to purchase park and recreational land (approved by the voters on November 6).

Finance.—In the 1961 fiscal year, revenue of $3,477,213,000 included $2,086,817,000 from state taxes and $414,586,000 in federal funds. Chief tax yields were from

individual incomes ($803,739,000), corporate incomes ($279,057,000), motor fuels ($221,897,000), and licensing ($203,654,000). Spending of $3,551,297,000 included $947,712,000 for education, $420,701,000 for health, welfare, and correction, and $474,683,000 for highways.

Education.—In the 1961–62 school year, public elementary schools staffed by 65,824 teachers enrolled 1,660,910 pupils; junior-senior high schools with 65,210 teachers enrolled 1,196,095; and parochial schools with 21,389 teachers enrolled 757,207. College enrollment totaled 445,000 in 192 institutions, including 50 junior colleges and 142 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $2,062,500,000, including current expenditures of $1,593,000,000 ($615 per pupil) and capital outlays of $365 million. Revenue of $2,359 million was drawn chiefly from state funds ($800 million) and local districts ($1,100 million). Teachers' salaries averaged $6,700 (high school, $6,985; elementary, $6,450). Actual spending for higher education (1961 fiscal year) comprised $75,719,587 for operations and $4,814,829 for construction and improvements.

Public Assistance.—In 1960, public assistance payments to a monthly average of 540,163 persons totaled $328,228,818. This amount included $164,831,346 for dependent children and $72,168,311 for the aged.

Transportation and Communications.—Contracts for 1,670 miles of highway construction and reconstruction were let during the 1962–63 fiscal year. *Highways and roads* on Jan. 1, 1962, totaled 106,000 miles (74,000 surfaced). These served 5,397,951 *motor vehicles* (as registered on Dec. 31, 1961), including 4,597,827 automobiles. Operating in the state in 1961 were 7 switching and 32 main-line *railroads* (the latter using 6,394 line miles of track); (1962) 38 regularly scheduled *airlines;* and 113 commercial and municipal *airports,* 30 seaplane bases, and 9 heliports.

Communications media included (1962) 140 AM and 57 FM *radio stations;* 22 VHF and 2 UHF *television stations;* (1961) 88 daily *newspapers* (circulation, 8,744,964); and (Jan. 1, 1962) 2,814,000 business and 6,290,000 residential *telephones.*

Labor Force.—The state's labor force in July 1962 included 6,207,000 wage and salary employees in nonagricultural establishments, compared with 6,140,000 a year earlier and an average of 6,205,572 for the 12 intervening months. Of nonfarm employees, 29.3% were in manufacturing, 19.8% in trade, and 16.4% in service and miscellaneous industries. Unemployment in July 1962 totaled 465,000, compared with 555,000 a year earlier.

Manufacturing.—Manufacturing engaged 1,957,065 workers in 1960, including 1,333,018 in production, and provided a payroll of $10,453,603,000. Adjusted value added by manufacture amounted to $18,013,494,000.

LEADING NEW YORK MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Printing and publishing	180,845	$1,098,373	$2,325,495
Apparel and related products	342,925	1,261,994	2,260,880
Food and kindred products	146,434	760,076	1,849,305
Electrical machinery	158,097	891,696	1,509,380

Paper and products	69,006	344,605	629,530

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, New York ranked 18th among the states in the value of its mineral output, with 1.26% of the national total. Production declined 10% from the 1960 record. The state was first in output of emery (sole producer), abrasive garnet, talc, soapstone and pyrophyllite, titanium, and wollastonite; and third in salt and zinc.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $628,281,000, compared with $645,679,000 for the corresponding period of 1961. For the full year 1961, income comprised $608,953,000 from livestock, $253,329,000 from crops, and $19,793,000 in government payments. Principal income sources in 1961 were wholesale milk, $442,156,000; cattle, $62,956,000; eggs, $57,143,000; and greenhouse and nursery products, $47,597,000.

NEW YORK MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	1,037,000	$ 1,373,000
Coke	...[1]	...[1,2]
Ferroalloys	86,286	20,118,000[2]
Gypsum	663,000	3,441,000
Iron ore, usable (long tons)	1,973,000	25,548,000
Iron, pig	3,828,189	229,890,000[2]
Lead (recoverable content of ores)	879	181,000
Natural gas (1,000 cu. ft.)	5,742,000	1,694,000
Petroleum (bbl.)	1,715,000[3]	8,163,000[3]
Salt, common	4,149,000	30,761,000
Sand and gravel	28,043,000	30,471,000
Stone	26,951,000	43,734,000
Zinc (recoverable content of ores)	54,763	12,595,000
Other minerals	...	76,495,000
Total	...	$228,983,000[2,4]

[1] Figures withheld to protect individual company's confidential data. [2] Values for processed materials are not included in the total. [3] Preliminary. [4] Total adjusted to eliminate duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

The state's 82,000 farms in 1959 had an acreage of 13,490,000 (5,033,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 2,174,000 cattle and 9,894,000 chickens. An average of 105,000 family and 55,000 hired workers engaged in farming in 1961.

NEW YORK CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	17,405	24,100	20,000
Beans, dry edible (1,000 bags)	1,252	1,331	1,274
Beans, snap (1,000 cwt.)	536	440	382
Cherries (tons)	26,220	36,200	13,000
Grapes (tons)	85,870	124,000	99,000
Hay (1,000 tons)	5,539	5,978	4,620
Maple sirup (1,000 gal.)	408	470	519
Onions (1,000 cwt.)	4,419	4,371	4,964
Potatoes (1,000 cwt.)	19,118	21,178	20,708
Wheat (1,000 bu.)	10,071	8,174	6,831

Events, 1962.—Early in the year public attention was centered on the state Legislature. Charges of conflict of interest involving the state's shelter-building program were brought against Assembly Speaker Joseph F. Carlino (Republican, Nassau County) by Assemblyman Mark Lane (Democrat, Manhattan). Following weeks of bitter argument and wide publicity, the Assembly voted on February 21 to fully exonerate Carlino of all charges. The sole vote in favor of censure was cast by Lane. The furor did not appear to have any consequence in the November election; Carlino was reelected and Lane did not run.

The work of the Legislature, which met from January 3 to March 31, brought praise from Republicans who stressed the gains made in the social and economic fields. Democrats criticized the Legislature particularly in its failure to provide sufficient financial relief for localities and to redistrict the state to give urban areas fairer representation in the legislative body.

The necessity for increased services continued to be met by public and private programs. A record $410,679,000 for highway construction was allocated for the 1962–63 fiscal year beginning April 1, approximately 45% of which will be paid by the federal government. On June 15, a 345,000-volt "Thruway of Power" was completed, providing electric transmission from New York City to the Niagara region.

The decision of the U.S. Supreme Court on June 25, holding that the recitation in public schools of the nondenominational prayer written by

UPI

Celebrating their November 6 re-election victories early the next morning are four prominent New York Republicans (l. to r.): U.S. Senator Jacob K. Javits; Governor Nelson A. Rockefeller; Lieutenant Governor Malcolm Wilson; and New York State Attorney General Louis J. Lefkowitz.

the New York State Board of Regents violates the Constitution, was followed by intense public debate. When school opened in September, the State Education Department made a ruling in effect excluding all spiritual observances in public schools. Most schools now observe a period of silence, rather than prayer. (See also EDUCATION; LAW.)

In mid-September, Republican and Democratic state conventions were held. The Democrats nominated Robert M. Morgenthau and Republicans named the incumbent Nelson A. Rockefeller to run for governor. The Democratic slate included John J. Burns for lieutenant governor, James B. Donovan for United States senator, Edwin R. Dudley for attorney general, and the incumbent Arthur B. Levitt for comptroller. For these offices, respectively, the Republicans named the incumbents Malcolm A. Wilson, Jacob K. Javits, Louis J. Lefkowitz, and John P. Lomenzo. The Liberal Party endorsed the Democratic nominations.

Election day, November 6, brought little change in the political balance, despite an animated campaign. Governor Rockefeller was reelected by a margin of 518,218 votes, compared with 573,034 in 1958. Although upstate voters gave the governor the usual Republican majority, they did not give him the overwhelming support which he had received in 1958. (It was speculated that the divorce obtained by Mrs. Rockefeller on March 16 may have been a contributing factor.) Interestingly, Senator Javits led his ticket to victory, defeating his opponent by 971,877. All major Republican nominees were reelected, except Lomenzo, who was defeated by the incumbent Levitt, and Marcus G. Christ, who was defeated by John F. Scileppi for justice of the Court of Appeals. The election was marked by an exceptionally large number of split ballots.

The electorate defeated a proposition, supported by the governor, which would have increased state subsidies for housing to admit low-income families into middle-income housing, but approved a proposition authorizing a $25,000,000 bond issue for the purchase of park and recreational land. They also approved three amendments to the state constitution which trimmed about 4,000 words from the basic law, but which made no substantive changes.

The economy of New York State continued to show signs of vigor during 1962. Total employment as of mid-September rose to an estimated 7,430,000 persons, an increase of 15,000 over the same period last year. Total unemployment decreased to 350,000, from 410,000 in 1961.

On November 30, 74-year-old Robert Moses announced that he would resign his five state posts (including the chairmanship of the State Power Authority) because, he alleged, Governor Rockefeller had asked him to give up his position as chairman of the State Council of Parks in favor of the governor's brother. Laurance S. Rockefeller had been associated with the park system since 1939 and was vice chairman of the council.

The State Liquor Authority was subjected to an investigation by a New York County grand jury, directed by District Attorney Frank S. Hogan, and by the State Investigation Commission. Martin C. Epstein, the 70-year-old Republican chairman of the Liquor Authority, was removed from his post by Governor Rockefeller on November 26 for refusing to testify before the grand jury without waiving immunity from prosecution. Other officials were also dismissed as the investigation continued.

The state suffered a severe drought from May through July. U.S. Secretary of Agriculture Orville L. Freeman on July 25 announced that farmers in 39 New York counties would be eligible for federal emergency loans.

NEW YORK CITY

This gateway to the United States, center of culture and finance, the most populous city in the nation, covers an area of 319.8 square miles, exclusive of inland waterways, and has a population of 7,781,984 (1960 census), divided among its five boroughs: the Bronx (43.1 sq.mi.; pop., 1,424,815), Brooklyn (78.5 sq.mi.; pop., 2,627,319), Manhattan (22.6 sq.mi.; pop., 1,698,281), Queens (114.7 sq.mi.; pop., 1,809,578), and Richmond (60.9 sq.mi.; pop., 221,991). About one half of the city's population is either foreign-born or born of immigrant parents.

The city government consists of a mayor (Robert F. Wagner, Democrat, elected for a third four-year term in 1961); a 25-member City Council, chief legislative body, elected for a two-year term; and a Board of Estimate, the fiscal and administrative agency of the city, composed of the mayor, the president of the City Council, the comptroller, and the five borough presidents.

A record expense budget of $2,784,731,222 for the fiscal year beginning July 1962, adopted by the City Council on May 29, was $237,276,485 higher than the 1961–62 budget. Education receives the largest proportion of the budget, 20%; welfare accounts for 11%; hospitals, 7%; police, 7%; fire, 4%; and sanitation, 3%.

To help pay for this increase the basic real estate tax was raised for the fiscal year 1962–63 from $4.10 per $100 of assessed value to $4.16. Value of real estate for this period was assessed at a record $27,236,319,115. The funded debt increased by $125,081,985, to $4,301,124,126. The Board of Estimate's capital budget of $1,084,755,351 for the 18 months beginning Jan. 1, 1963, was approved by the City Council on December 20.

For the most part, the city's economy showed improvement during 1962. At midyear, employment was higher than it had been 12 months earlier (up 21,000 to 4,061,200). In the same period, unemployment declined 17.6%, department store sales increased, and wages of production workers rose to $89.89 for 37.8 hours of work (from $86.61 for 37.3 hours in 1961). The cost-of-living index reached 105.8 (1957–59 = 100), compared with 104.3 in 1961.

An extensive program of new building construction and urban renewal projects remained a vital part of the city scene in 1962. The Lincoln Center for the Performing Arts, covering 14 acres on Manhattan's West Side—intended to revitalize the cultural activity of the city, as well as to clear a congested residential area—was well on its way to completion. Philharmonic Hall, the first of the major buildings in the complex, was opened on September 23. (See also MUSIC.) Construction began in March on the 126-acre New York City Terminal Market in the Bronx, scheduled for completion in 1964, and expected to be the world's largest fruit and produce market. On September 24, the 50-story Americana opened its doors and became the city's first hotel of more than 1,000 rooms to be constructed since 1931.

The city's skyline is newly dotted with numerous middle- and low-income housing projects. Almost 27,000 cooperative and rental apartments were under construction in 1962 with state and city aid. On June 26, the Board of Estimate approved the controversial West Side (Manhattan) and Cadman Plaza (Brooklyn) urban renewal projects, which will combine low-cost, middle-income, and luxury housing.

The 1963–64 capital budget allocated funds for 36 new school construction projects. A total of 1,023,875 students were enrolled in the city's elementary, junior high, and academic and vocational high schools in September 1962, an increase of 19,618 over the preceding year. As part of an integration effort, 9,000 Negro and Puerto Rican children were transferred to predominantly white schools outside of their district under the Open Enrollment Program. Calvin E. Gross of Pittsburgh was appointed superintendent of schools on October 23 to replace John J. Theobald. Total enrollment in the 37 private and public colleges throughout the city in September 1962 reached 251,614.

Although New York retained its position as the leading port in the nation, the volume of oceangoing traffic in and out of the Port of New York continued to decline. During the first nine months of 1962, 19,602 passenger and cargo vessels entered and left the port (compared with 19,896 during the same period of 1961). Ten years ago the port handled one third of the nation's cargo, compared with 21.4% in 1961. The Port Authority has planned, started, or completed a number of new piers in order to attract business going to competing ports. The bright spot in the transportation picture was the records set at air terminals. During 1961, air cargo traffic increased 11.4% over 1960, and passenger traffic increased 2.1%.

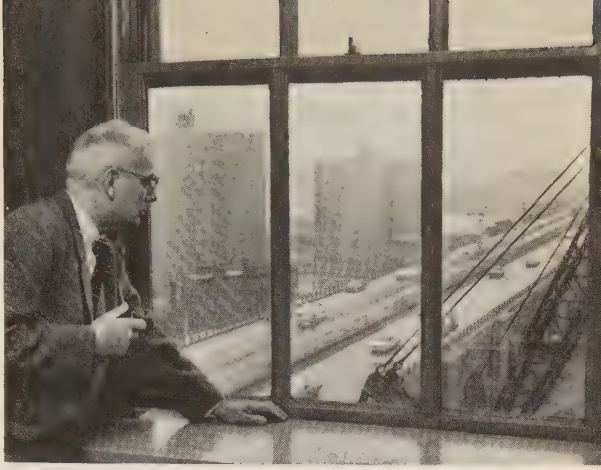
Among the major transportation improvements of 1962 was the opening on August 29 of a six-lane lower deck of the George Washington Bridge. (See BRIDGES.) Henry A. Barnes became traffic commissioner on January 15, and initiated numerous experiments to meet the city's difficult traffic problems.

Labor-management relations continued to be a major problem and center of concern for New Yorkers in 1962. A four-day strike called on January 1 against the Fifth Avenue Coach Lines by the 6,000 members of the Transport Workers Union was settled with the assistance of city officials. When the city refused to permit a fare increase, the company dismissed some of its employees. The union then began a second strike on March 1 which halted bus service in Manhattan and the Bronx. On March 21 the city, empowered by the state legislature, seized the struck lines and the employees went back to work. The bus company sought redress in the courts, where the matter was awaiting decision.

One of the most controversial and highly publicized strikes of 1962 came from an unusual source—the teachers of New York City, whose demands for pay increases and the right of collective bargaining were at the heart of the dispute. On April 11, about half of the city's 40,000 teachers went on strike, and 25 schools were closed. A bitter political dispute between Albany and City Hall was resolved when it was announced the following day that the state would give the city an additional $13 million for educational needs, and the right to borrow against $48.6 million more. In May, pay raises were announced; and in October the principle of collective bargaining was accepted by the city. (See also EDUCATION.)

Other labor stoppages included a strike in January by the International Brotherhood of Electrical Workers; maritime strikes which halted activity on the docks between June 16 and July 3 and again in December; a walkout in July of nonmedical employees in two hospitals; and a newspaper strike in November which halted publication of the *News* for eight days.

Nine daily newspapers with a combined circulation of about 5½ million suspended publication on December 8 after a printers' strike closed four of them. Major issue in the dispute was wage increases. Nearly 20,000 employees of the papers were idled, and publishers' losses in advertising and circulation revenue ran into the millions of dollars. The shutdown also had a considerable impact on the city's economic life during the holiday season, and many stores reported a decline in Christmas sales. (See also NEWSPAPERS.)



THE NEW YORK TIMES

Henry Barnes, on his first day as New York City traffic commissioner, January 15, studies traffic on Brooklyn Bridge.

Despite vociferous opposition from business, the Board of Estimate approved legislation setting a minimum wage of $1.25 per hour for all employees of private business in the city, effective Nov. 21, 1962. The courts have been asked to decide the legality of the law.

Juvenile delinquency and crime continued an ever-current problem, as the crime rate during the first six months of 1962 increased 8.5% over the previous year. Numerous attempts were made to stem the vicious cycle of slums and crime, including an announcement by President Kennedy on May 31 of a $12,600,000, three-year mass social experiment on the Lower East Side of New York, called Mobilization for Youth.

Increasing use of the judicial system led to the reorganization of the courts as of Sept. 1, 1962. The County Courts, which had handled criminal

A model of the 1964–65 World's Fair in Flushing, N.Y., is viewed by President Kennedy in New York City, December 14. The fair is expected to open on April 22, 1964.

UPI

cases of a serious nature, were abolished, and their jurisdiction transferred to the Supreme Courts. The Family Court replaced the Domestic Relations Court; the Criminal Court replaced the Court of Special Sessions; and the City and Municipal Courts were absorbed in a new Civil Court.

Rent control of residential properties, a state responsibility since 1950, was transferred to the city by enabling legislation signed by Governor Rockefeller on Feb. 17, 1962. Mrs. Hortense Gabel was appointed the city's first rent and rehabilitation administrator on April 2.

In the November 6 elections, Robert M. Morgenthau, the unsuccessful Democrat-Liberal candidate for governor, carried the city by a vote of 1,282,972 to 1,077,607 for Nelson A. Rockefeller, the Republican incumbent. In the race for United States senator, Jacob K. Javits outpolled his Democrat-Liberal opponent, James B. Donovan, by a vote of 1,224,444 to 1,089,937 in the city and was reelected by a wide margin in the state. Louis J. Lefkowitz (Republican) was reelected attorney general, although he failed to carry the city. Arthur Levitt remained comptroller with an easy victory. The city continued to be a Democratic stronghold, sending 16 Democrats and 3 Republicans to Congress.

LEO HERSHKOWITZ,
Department of History, Queens College.

NEW ZEALAND

Lying some 1,200 miles southeast of Australia in the South Pacific Ocean, this autonomous British dominion and member of the Commonwealth of Nations comprises two principal islands: North Island (44,281 square miles) and South Island (58,093), with adjacent Stewart Island (670) and Chatham Islands (372). The total land area, including minor islands, is 103,736 square miles.[1]

New Zealand's population (2,414,984, including 167,086 Maoris, according to revised 1961 census figures) was 2,485,478 (including 174,918 Maoris) as of June 30, 1962. Excluded from the total were the 1961 populations of Cook Islands (18,378); Niue Island (4,845); Tokelau Islands (1,960); and Western Samoa (108,810). Urban areas, including principal cities and their adjacent boroughs, with populations (including Maoris) were: Wellington, 153,300 (Wellington City, the capital, 124,700); Auckland, 466,300 (city, 145,000); Christchurch, 226,800 (city, 153,500); Dunedin, 106,100 (city, 73,700); and Hutt, 102,400 (Lower Hutt City, 54,000). Immigrants intending permanent residence, 1962 est., 32,769 (assisted passages, 3,584); permanent departures, 12,691.

Government.—In 1962, Brigadier Sir Bernard Fergusson succeeded Viscount Cobham, who had served from Jan. 2, 1957, as governor general. He is assisted by a 16-member Executive Council headed by the prime minister, Keith J. Holyoake. The legislature is unicameral, consisting of an 80-member House of Representatives (including 4 Maoris), popularly elected every 3 years; in 1961 the National Party held a majority of 12 seats over the Labor Party.

Education and Religion.—Government expenditure on education (1961–62): £NZ43,550,000. Number of schools (with enrollments, 1960–61): 2,028 public (state) primary (378,927); 335 private primary (54,168); 156 Maori (13,187); 45 intermediate (31,628); 109 public secondary (64,434); 108 private secondary (18,684); and 41 technical (22,716). Enrollments in 1960 at 4 universities and 2 agricultural colleges aggregated 16,524; at 7 teacher-training colleges, 5,105. Principal religious groups (with adherents, 1956): Church of England (780,999); Presbyterian (483,884); Roman Catholic (310,723); and Methodist (161,823).

Finance.—Estimated government expenditure, 1962–63: £NZ498.5 million (up £NZ11.4 million over 1961–62), including (in millions): social services, £NZ223.9 (up £NZ11.5); works and other capital expenditure, £NZ72.5; administration, £NZ33.4; and defense, £NZ28.6. The budget for 1962–63 provided for tax concessions of £NZ14 million, and for increased war pensions; expenditures were to be met from taxation (£NZ426 million), and by borrowing.

Social Services.—Payments in force on March 31, 1962, and their annual value (in thousands) included: old-age, 100,083 (£NZ24,208); widows, 13,623 (£NZ4,450); welfare, 6,499 (£NZ322); family, 357,568 families with 874,000 children (£NZ32,846); superannuation, 105,499 (£NZ24,094); war veterans allowances, £NZ6.38 million.

Defense.—Personnel in the chief arms of defense (1961): army regulars, 4,905 all ranks; territorial reservists, 60,951, including 7,753 volunteers; Royal New Zealand Air Force regulars, 4,390; Royal New Zealand Navy, 2,851 officers and ratings.

Transportation and Communications.—Government railways, 1961–62: 3,333 miles of track; passengers carried, 26,324,000; freight, 10,822,000 tons. Motor passengers, 22,280,000; operational revenue, £NZ36,639,000; expenditure, £NZ36,801,000. Road mileage (1960): 56,893; licensed motor vehicles (1962), 961,676 (automobiles, 561,888). In 1961–62 the domestic services of New Zealand National Airways carried 843,500 passengers, and 68,300 tons of freight; in 1961, international air services carried 124,800 passengers, and 1,284 tons of freight. Telephones, 744,797 (1960); radios, 580,000 (1960); television sets, 46,000 (1962).

Economic Indicators.—National income at market prices, 1961–62: £NZ1,247.8 million; gross national product, £NZ1,345.8 million. Net overseas assets, May 1962: £NZ64,431,000, an increase of £NZ17 million over December 1961—the lowest figure in more than three years. Cost-of-living index (1958 = 100): 106 in 1961 (105 in 1960).

Manufactures and Mining.—The labor force (902,000 in 1961, including 237,900 in manufacturing industries) exceeded 919,000 in 1962. Chief manufactures (1961): household appliances, 345,358 units; yarn, 9,508,000 pounds; woolen piece goods, 5,009,000 square yards; cigarettes, 3,191 million; passenger cars, 31,884; trucks and buses, 9,744; radios, 151,898; television sets, 20,699; and electric power, 7,327 million kw.-hr. The output of 8,734 factories was valued at £NZ756,800,157 in 1961. Chief minerals: coal (2,913,000 tons in 1961), and gold (33,000 ounces, valued at £NZ418,500, in 1960).

Agriculture.—Number of sheep (1961–62): 48,485,000; cattle, 6,446,000 (dairy cows, 1,929,000). Sheep and lambs shorn totaled 57,253,000, for a record clip of 590 million pounds; wool sales (greasy basis), 423,358,000 pounds; meat production, 757,000 tons. Chief crop acreages and yields (in thousand bushels, 1961–62): wheat, 183,000 (8,601); oats, 32,000 (1,585); and barley, 73,000 (3,490).

Foreign Trade.—In 1960–61, imports were valued at £NZ322,097,000, including (in millions): machinery, £NZ89.38; metal manufactures, £NZ46.16; textiles, £NZ37.44; chemicals, £NZ22.36; food, beverages, and tobacco, £NZ21.71; and mineral fuels, £NZ21.46. Total exports, 1960–61: £NZ283,679,000 (including re-exports), chiefly wool, £NZ100,144,000; meat, £NZ77,045,000; and dairy produce, £NZ68,382,000. Of total 1960–61 exports, £NZ164,967,000 went to Commonwealth countries (United Kingdom, £NZ143,387,000); imports from the Commonwealth, £NZ207,978,000 (United Kingdom, £NZ128,455,000). Exports to the United States (New Zealand's second biggest market) totaled £NZ40,843,000; imports from the United States, £NZ27,023,000.

Events, 1962.—After talks with political leaders in Europe and the United States, Deputy Prime Minister John R. Marshall reported to the House of Representatives on June 20 that "profound changes, affecting every person in New Zealand," would follow the entry of Great Britain into the European Economic Community (Common Market). He warned that although his government was searching the world for new markets and was finding some, no substitute had yet appeared for the British market for New Zealand's exports of mutton, lamb, butter, and cheese.

To prevent the threatened dislocation of trade, the British government sought a protocol to the Community's Treaty of Rome (1957) which

[1] Outlying groups include the Auckland Islands (234 square miles), Campbell Island (44), and the Antipodes Islands (24). New Zealand administers the island territories of Cook (with associated islands, 90 square miles), Niue (100), Tokelau or Union (4), and Kermadec Islands (13), and the Ross Dependency (175,000) in the Antarctic. Jointly with the United Kingdom and Australia, New Zealand is a trustee of Nauru (q.v.), but it relinquished its trusteeship of Western Samoa (q.v.) on Jan. 1, 1962.

would provide opportunity for comparable outlets for international agricultural products into the enlarged Common Market. In 1962, however, the Community's policy was restrictive of agricultural trade. Marshall said that in addition to receiving assurances from Great Britain that it would protect New Zealand's vital interests, he had had "encouraging discussions" in Washington with President Kennedy, whose influence would be used "toward breaking down the trade barriers which so sorely beset us." (See also COMMONWEALTH OF NATIONS; EUROPE; GREAT BRITAIN.)

Prime Minister Holyoake attended the London conference of Commonwealth prime ministers in September. He later met with President Kennedy in Washington, and described their wide-ranging discussion as "very useful and friendly."

Wool prices at New Zealand auctions averaged 39.25 pence per pound in 1962 (1.19 pence below prices in the previous year); gross receipts fell by £NZ2.3 million to £NZ95.5 million. Affected also by lower prices for lamb and beef, export earnings increased by only £NZ3 million in the fiscal year 1962.

A memorial to Adm. Richard E. Byrd, who had spent much time in New Zealand preparing for his five Antarctic expeditions, was unveiled by Prime Minister Holyoake on Mount Victoria, near Wellington, on March 11, the fifth anniversary of Admiral Byrd's death.

Two Soviet diplomats were expelled from New Zealand on July 12 for espionage, of which the government said it had "conclusive proof."

Author and Publicist.

NEWFOUNDLAND

Bounded on the east and south by the Atlantic Ocean and on the west by the Gulf of St. Lawrence and the Province of Quebec, this most easterly of the Canadian provinces has an area of 156,185 square miles (including Labrador on the mainland) and an estimated population on July 1, 1962, of 471,000 (1961 census, 457,853). The chief urban centers (with 1961 census figures) are: St. John's the capital, 90,838 (metropolitan area); Corner Brook, 25,185; Wabana, 8,026; Gander, 5,725; Stephenville, 6,043; and Windsor, 5,505.

Government.—Newfoundland has 6 members in the Senate of Canada and 7 members in the federal House of Commons. The province is administered by a lieutenant-governor and a Legislative Assembly of 42 members (34 Liberals, 7 Progressive Conservatives, and 1 Independent), elected on Nov. 19, 1962. The lieutenant-governor in 1962 was Campbell L. Macpherson, and the premier was Joseph R. Smallwood.

Education.—In 1961–62 there were 1,253 schools, with 128,917 pupils and 4,317 teachers. Memorial University, in St. John's, had an enrollment of 1,907 students in 1961–62.

Finance.—Revenue on current account in the 1961–62 fiscal year was $86,141,765; expenditures, $85,926,700. Revenue for 1962–63 was estimated at $90,658,700.

Industry.—The basic industries are pulp and paper, mining, and fishing. The value of forest production in 1961 was approximately $86 million; of minerals, $93 million; and of fisheries, approximately $25 million. Labrador, which is being actively explored and developed, has a proved iron ore reserve of over 3 billion tons in addition to some of the most valuable stands of virgin timber in North America and a potential of 9 million horsepower of electrical energy on the Hamilton River. On Newfoundland, there are two pulp and paper mills, large areas of timber, and extensive deposits of iron ore, limestone, lead, zinc, copper, fluorspar, pyrophyllite, and gypsum.

Transportation and Communications.—The Canadian National Railways has a total of 705 miles in Newfoundland, with the main line extending 547 miles from St. John's on the east coast to Port aux Basques on the west coast. A 347-mile railway has been built in Labrador extending from Knob Lake to Seven Islands in Quebec. Commercial air services link Newfoundland with mainland Canada and with Europe. There are worldwide cable connections, and the federal government provides telegraphic service throughout the province. At the end of 1962 there were some 65,000 telephones.

Events, 1962.—On August 18, celebrations were held at Placentia marking the Tercentenary of the founding of that community by the French in 1662. The Atlantic Charter was drawn up in Placentia Bay in 1941 by President Roosevelt and Prime Minister Churchill. At Labrador City, a multimillion dollar iron ore development began operations in July with hydroelectric power from the Hamilton River. Mining became the province's leading industry for the first time in 1961.

Premier Joseph R. Smallwood and his Liberal Party were returned to power in the November 19 election, which had been called to seek a mandate for the premier's $70 million fisheries development program. In the last session of the legislature, the Legislative Assembly had been increased from 36 to 42 members.

J. G. CHANNING,
Deputy Minister of Provincial Affairs, Provincial Government of Newfoundland.

NEWSPAPERS

The basic circulation figures of newspapers in the United States changed only slightly from 1961 to 1962, but the general pattern of publishing was altered by continuing consolidation, expansion of chain ownership, and growth of the population of suburban areas. In March 1962 there were 1,763 daily English-language newspapers in the United States, with an aggregate circulation of 60,293,114, the March report of the Audit Bureau of Circulation showed. This was a gain of 2 newspapers and 0.14% in circulation over the previous year.

Acquisitions, Mergers, and Suspensions.—Samuel I. Newhouse, owner of the second largest chain of newspapers (in circulation) in the United States, acquired his 19th paper, the New Orleans (La.) *Times-Picayune* in June for $40 million. In October Newhouse offered $41 million for the Omaha (Nebr.) *World-Herald*, an offer that was accepted by the paper's board of directors. The stockholders, meeting to accept the offer, however, heard a last-minute bid by an Omaha contractor, Peter Kiewit, to buy the newspaper, and sold it to him instead of to Newhouse. The purchase price was in excess of $40 million, including the newspaper, a television station, and real estate. The 19 Newhouse newspapers in 1962 had an aggregate circulation of over 6 million, compared with about 8.6 million for newspapers owned by the various corporations of the Hearst empire.

In early January 1962, Los Angeles lost two of its daily newspapers when the Chandler interests suspended publication of the afternoon *Mirror* and the Hearst morning *Examiner* was incorporated into the afternoon *Herald Express* under the name of the *Herald Examiner*. In June the Hearst Publishing Co., Inc., acquired full control of the evening San Francisco *News-Call Bulletin*, formerly a joint venture of the Hearst and Scripps-Howard chains. The paper had resulted from a merger in 1959 of the Scripps-Howard *News* and the Hearst *Call-Bulletin*.

In Phoenix, Ariz., the Arizona *Journal*, an offset daily, published its first edition on Feb. 14, 1962. (Two months later the paper won third honorable mention for newspapers over 50,000 circulation in the F. Wayland Ayer Cup typographical competition. The *Christian Science Monitor* won first prize.) Dow Jones & Co., publishers of the *Wall Street Journal*, began publishing the *National Observer*, a national weekly newspaper, on February 4, and later changed the day of publication from Sunday to Monday. The New York *Times* on Octo-

ber 1 began publication of its west coast edition in Los Angeles, with circulation in 13 states, including Alaska and Hawaii. The paper, which is preponderantly mail-delivered, is basically the same as the New York edition, with news of purely New York interest deleted, and with considerably less advertising. It is published six days a week.

The Harte-Hanks group of Texas acquired the stock of the San Antonio *Express-News*. In Hawaii, the Chinn-Ho Syndicate merged the Honolulu *Star-Bulletin* and the *Advertiser* into a common operation. The Roy Thomson group of Canada bought three small dailies in Austin, Minn., Dalton, Ga., and Lafayette, La., and sold the St. Petersburg (Fla.) *Independent* to the St. Petersburg *Times*.

Among the papers which suspended publication in 1962 were the Jamestown (N.Y.) *Sun*, after 13 years of operation, and the Jackson (Miss.) *State Times*, after almost 7 years. In both cases, greatly increasing costs were blamed.

In Minneapolis, Minn., the *Herald*, created to fill a void during a 116-day strike against the Minneapolis *Star* and *Tribune*, quit publication after the strike was settled on August 3. Also suspending publication was the weekly Milwaukee (Wis.) *Reporter*, which tried to convert to daily operation after the Milwaukee *Journal* purchased the *Sentinel*, a Hearst paper. The *Sentinel* was closed by a strike of the American Newspaper Guild in May and was sold on July 19, with the strike still in progress. The *Sentinel* continued publication under the new management.

Strikes and Strike Rulings.—In addition to the strikes in Minneapolis and Milwaukee, the Detroit (Mich.) *Free Press* and *News* were shut by a strike of teamsters and mechanical unions from April 11 to May 11. A strike of the Teamsters Union and the American Newspaper Guild closed the Cleveland *Plain Dealer* and the *Press and News* on November 29.

An American Newspaper Guild strike closed the New York *Daily News*, the largest paper in the United States, from November 2 to November 10. It was settled on the basis of a wage increase of $8 a week, spread over two years. The New York Typographical Union rejected the same offer and struck against four newspapers on December 8; the five other daily newspapers in the Publishers Association of New York then ceased publication. (The *Long Island Press* closed its edition for Queens County, a part of New York City, but continued publication of its editions for suburban Nassau and Suffolk counties.) The strike and shutdown continued into 1963.

The major issues were wages, working rules, and the introduction of more automation in the newspaper production departments. The National Labor Relations Board ruled in November that members of the Publishers Association could suspend publication jointly in a breach-of-contract dispute. The publishers relied on the same doctrine to shut down when one or more newspapers was subjected to a strike after the expiration of a contract.

Circulation and Sales.—At the Sept. 30, 1961, audit of the Audit Bureau of Circulation, 1,761 daily newspapers had a circulation of 59,261,464, less than 1% higher than a year earlier. There were 312 morning editions with a circulation of 24,094,361, a gain of 0.27% over the previous year; 1,458 evening newspapers with a circulation of 35,167,103, a gain of 0.9%; and 558 Sunday editions with a circulation of 48,216,499, a gain of 1.1%.

The 1962 *Ayer Directory of Publications* listed 8,964 weekly, 353 biweekly, and 33 triweekly newspapers in the United States, with an aggregate paid circulation of 24,027,995. This was an increase of 19 newspapers and 500,000 subscribers over the previous year's figure.

Advertising.—The dollar value of newspaper advertising in 1962 was about $3 billion, about 3% above the 1961 figure. Circulation revenue was expected to be about $2 billion. Including the income of weekly newspapers, the newspaper business was a $6 billion industry.

Personnel.—John Denson resigned as editor of the New York *Herald Tribune* on October 11 after serving in that post since March 1961. Denson had come to the *Herald Tribune* from *Newsweek* magazine.

Westbrook Pegler, for 18 years a columnist for the Hearst-owned King Features Syndicate, resigned in August 1962 because of "irreconcilable differences on vital matters."

Lee Hills of the Detroit *Free Press* was named president of the American Society of Newspaper Editors in April, and Irwin Maier, publisher of the Milwaukee *Journal* and *Sentinel*, became president of the American Newspaper Publishers Association.

Canada.—As of March 31, 1962, Canada's 103 daily newspapers had an aggregate circulation of 4,162,501, slightly higher than a year earlier. *Le Petit Journal* of Montreal, which began publication in 1961, closed in 1962. The Thomson group added its 26th paper, the Ft. William (Ontario) *Times Journal*. The Toronto *Globe and Mail* opened several foreign bureaus and moved toward publication of a national newspaper.

JEROME H. WALKER,
Executive Editor, "Editor & Publisher."

NICARAGUA

Situated between Honduras and Costa Rica, the Republic of Nicaragua is the largest of the Central American republics. It has an area of 57,143 square miles, including the 3,475 square miles of its two major lakes, and a population of 1,552,000 (Dec. 31, 1961, est.). Principal cities and populations (June 30, 1960, est.): Managua, the capital, 242,227; Léon, 73,616; Matagalpa, 65,321; Jinotega, 51,448; Masaya, 45,495; Granada, 44,183. Spanish is the official language.

Government.—Nicaragua is organized as a republic with a highly centralized form of government. Administratively it is divided into 16 departments, 1 national district, and 123 municipalities. The chief executive is the president (Luis A. Somoza Debayle, elected Feb. 3, 1957) who is elected for a single 6-year term, and is assisted by a cabinet of 11 members. The bicameral National Assembly consists of a 19-member Senate (16 elected directly for 6-year terms to represent the several departments, and 3 appointed) and a 42-member Chamber of Deputies (elected directly for 6-year terms). Political parties and number of seats held in the Chamber of Deputies: Nationalist Liberal (PLN), 28; Nicaraguan Conservative, 14. The highest judicial body is the Supreme Court of Justice.

Education and Religion.—School enrollment, 1960: 319,017. Number of schools (with enrollments, 1960): 2,082 public primary (152,783); 2,184 public and private secondary (165,050); 1 university (1,184). In June 1961, the Central American Catholic University was inaugurated in Managua. In 1961, illiteracy of all ages was estimated at 65.5%, and nearly 40% of the children of school age were without schooling. Principal religion: Roman Catholicism.

Finance.—Government revenue, 1962–63 est.: 306.1 million córdobas (up 59.9 million from 1961); expenditure, 311.8 córdobas (up 59.6 million from 1961). The córdoba was revalued on July 1, 1955, to U.S.$0.142. National debt: 114.4 million córdobas as of April 1962. Gold and foreign exchange holdings: $32.8 million as of June 1962 (up $11.8 million from June 1961). Per capita income (1961): $170.

Transportation and Communications.—Transport network (kilometers): railways (1960), 403; main roads (1961): paved, 687; all-weather, 1,855; dry weather, 3,558. National airline (1960): Líneas Aéreas de Nicaragua (LANICA); Nicaragua is also served by 11 foreign airlines. Motor vehicles (1960): 8,650 passenger cars; 5,000 trucks; 500 buses. Telephones: 8,224 (1960); radio receivers, 35,000 (1958); television sets, 6,000 (1959).

Economic Indicators.—Gross national product: 291.8 million córdobas in 1959. Cost-of-living index (1953 = 100): 116 in August 1961 (95 in September 1960). Consumer price index (1956 = 100): 96.1 in January 1961 (95.7 in January 1960).

Manufactures and Minerals.—Industry accounts for about 10% of national income. Chief products (1960): cigarettes, 819.2 million (up 3.8% from 1959); matches (boxes of 40), 21.7 million (up 2.7%); beer, 4.1 million liters (down 18.7%); aguardiente, 4 million liters (down 24.6%); cement, 32,000 metric tons (down 8.5%); silk

textiles, 10.7 million yards (up 5.9%); electric power, 183.6 million kw.-hr. (up 10.6%).

Agriculture.—Agriculture is the principal source of national wealth, and it accounts for about 40% of the national income and engages about 65% of the labor force. Chief crops (1961–62): cotton, 245,000 bales (of 500 pounds each; up 44% from 1960–61); cottonseed, 2.2 million quintals (of 101.4 pounds each); coffee, 540,000 quintals (up 4.5%); coffee (soluble), 3 million pounds; sugar (1960), 1,322,432 quintals (down 5.6% from 1959). Dairy production (1960): milk, 13,941,405 liters (up 35.6% from 1959). Meat production (1961–62): beef, 15 million pounds (up 36% from 1960–61).

Foreign Trade.—Total exports, 1961: $68.4 million (up 8% from 1960); imports, $74.4 million (up 3.3%). Principal exports (1961): cotton, $18.4 million; soluble coffee, $2.1 million; beef, $4.7 million; livestock, $1.7 million; shrimp, $475,000. Principal imports: machinery, vehicles, iron and steel products, chemicals and drugs, foodstuffs. Chief customers (with percentages of total Nicaraguan exports received, 1959): United States (26.62%); Japan (21.65%); West Germany (14.15%); United Kingdom (6.52%); Netherlands (1.66%). Principal suppliers (with percentages of total imports provided, 1959): United States (52.01%); West Germany (7.2%); Netherlands (6.46%); Japan (5.02%); United Kingdom (4.29%).

Events, 1962.—In January, while the agrarian reform law awaited action by the National Congress, the government acquired some 5,800 manzanas (1 manzana equals 1.74 acres) for distribution to small farmers. Between March and June, however, spontaneous invasions of farm lands by landless peasants took place in the southeastern departments of Chinandega, Léon, and Matagalpa. Strikes by dockworkers in San Juan del Sur and Corinto in April were followed by the strike of the Nicaraguan teachers' federation in June.

Foreign capital in loans was sought for basic economic sectors. By September, publicly announced loans amounted to $29 million, 65% of which came from the Inter-American Development Bank ($7.7 million), the Agency for International Development ($7.34 million), the International Bank for Reconstruction and Development ($3.2 million), and the United Nations Special Fund ($800,000). Principal projects financed included home construction, farm credits, and agricultural development for low-income families. Private credits of $10 million from the Compagnie Générale d'Enterprises Electriques (Paris) were granted in July to establish battery and plastics factories.

Political opposition to the long rule of the Somoza family was linked with the need for radical social changes. A strong fear persisted that the presidential election scheduled for February 1963 would not be freely conducted as promised. Candidates and party platforms, nevertheless, emerged in 1962. In January, Fernando Agüero Rocha was chosen as candidate of the opposition Conservative Party on a platform of complete social reform.

The Somoza-led Nationalist Liberal Party in April named as its candidate Foreign Minister René Schick Gutiérrez, who resigned in July to devote full time to the campaign. An anti-Somoza National Opposition Front (FON) nominated Humberto Alvarado Vásquez as candidate. This development, however, suggested the possible division of the opposition. Proposals for supervision of the election by the United Nations or the Organization of American States were officially rejected by the administration as an invasion of Nicaraguan sovereignty. The ensuing period of political unrest was highlighted by a gun battle on July 11 in the Chamber of Deputies.

When the all-important Supreme Electoral Commission was formed in September, the Nicaraguan Conservative Party refused to name a representative on the ground that the commission was fradulently composed. Toward the end of the year, it appeared that the Conservatives would probably abstain from the pending presidential election and leave the Nationalist Liberals with no more than token opposition.

NICKEL

The United States, the world's largest consumer of nickel, in 1961 produced only 2.8% of the world's total (3.5% in 1960). World output of nickel in 1961 was estimated at 396,000 short tons, 10% greater than in 1960. Estimated free-world output was 301,000 short tons, almost 4% larger than in 1960.

United States mine output of nickel was 13,113 short tons in 1961, or 7% less than the 14,079 tons produced in 1960. According to the U.S. Bureau of Mines, the deficit of 16% in nickel imports from Cuba, resulting from the seizure of United States nickel plants in 1960, was made up by increased imports from Canada. Canada's output in 1961 increased 10% over 1960 to 236,555 tons, providing the major part of free-world production (79%).

United States imports of new nickel products for consumption, chiefly from Canada and Norway, totaled 131,134 tons gross weight in 1961, 23% more than the 109,042 tons imported in 1960. Exports of nickel from the United States (mainly contained in nickel and nickel alloys in ingots, bars, rods, and other crude forms and scrap) increased from 54,109 tons in 1960 to 55,493 tons in 1961. Shipments to West Germany were 28% of the total; to Japan, 22%; to Sweden, 21%; and to Canada and the United Kingdom, 8% each.

Total consumption of nickel in the United States in 1961 was 118,515 short tons, 10% greater than the 108,159 tons used in 1960. In the first eight months of 1962, consumption of nickel (exclusive of scrap) totaled almost 80,000 short tons (reported by companies, which consumed 94.5% of the total nickel in 1961).

(See Mineral Production for output of major producing countries.)

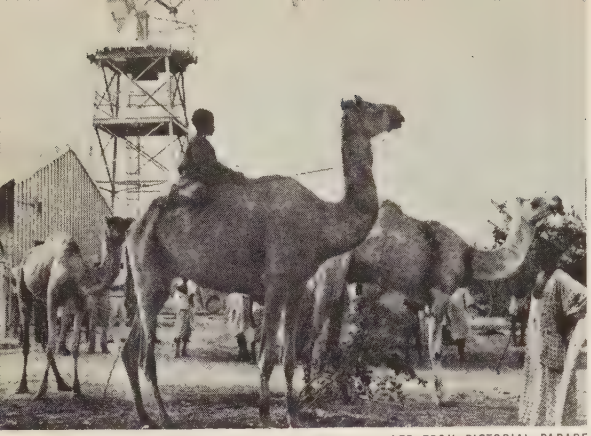
NIGER

The Republic of the Niger is a landlocked, relatively inaccessible country in north-central Africa, with an area of 458,993 square miles that is largely desert. The population of 3,112,000 (1962 est.) consists mainly of sedentary Hausa and Djerma-Songhai ethnic groups in the south and nomadic Peuls and Touaregs in the central and northern regions. The capital and largest city is Niamey (est. pop., 30,000), situated on the Niger River. French is the official language, but many African languages are spoken.

Government.—This former territory within French West Africa attained full independence on Aug. 3, 1960. The president of the republic conducts policy, initiates laws, and is empowered to wield exceptional powers to preserve national security. He is elected by the unicameral National Assembly, which is chosen by universal suffrage for a five-year term. Hamani Diori, leader of the Niger Progressive Party, was elected president on Nov. 9, 1960. He heads a cabinet composed entirely of members of his own party. Niger is a member of the Council of the Entente.

Education and Religion.—About 6% of the school-age population attends school. In 1960 there were 192 primary schools (with 21,054 pupils) and 8 secondary schools (1,040 pupils). Education has been hampered by reason of the large proportion of nomadic peoples in the country, the lack of Christian missions operating among the largely Muslim population, and a shortage of teachers.

Finance.—The estimated government budget for 1962 was balanced at 7.2 billion francs CFA, a rise of 17% over 1961 (246.85 francs CFA equal U.S.$1). In late 1961 a government-controlled development bank was



AFP FROM PICTORIAL PARADE

The history of transportation is epitomized as camels at Kano, Nigeria, amble by one of the 18 monitoring towers in the Project Mercury manned space flight control network.

opened in Niamey with a capitalization of 150 million francs CFA.

Transportation and Communications.—Road networks (miles, 1961): paved, 48; gravel or stone, 1,817; dirt, 3,400. There are no railroads. Niamey has an international airport. Most of the foreign trade passes through the port of Cotonou, Dahomey. Niamey and Zinder are the southern terminals of two trans-Saharan highways.

Production.—The economy is based on agriculture and stock raising. Principal food crops (metric tons, 1960): millet and sorghum, 938,000; cassava, 101,000; cowpeas, 47,000; onions, 19,000; rice, 7,000. Chief crops and other products for export (metric tons, 1960): decorticated peanuts, 50,525; hides, 1,358; live animals, 134,386; peanut oil, 5,470 (1959); gum arabic, 53 (1959); tin, 87.

Foreign Trade.—Total exports, 1961: 2,261 million francs CFA (3,108 million in 1960); imports, 4,663 million francs CFA (3,439 million in 1960). Chief exports (millions of francs CFA, 1961): peanuts, 1,023; peanut oil, 366; oilcake, 79; and livestock and livestock products, 796. Main imports were food, textiles, transport materials, metal products, and fuel. France took 71% of Niger's exports and provided 50% of imports in 1960.

Events, 1962.—Ardaly Douada, an exiled leader of the illegal Freedom Party, was assassinated in Bamako, Mali, on May 24. The party's leadership, which has advocated Niger's inclusion in a proposed Mali Federation, blamed the murder on the Niger government, but the charge was officially denied.

In an effort to stimulate agricultural production and streamline the marketing facilities for agricultural products, the government approved the establishment of Copro-Niger, a semigovernmental trading company, with a capitalization of 50 million francs CFA.

Iron deposits exceeding an estimated 100 million tons of medium-quality ore were uncovered at Say, about 40 miles southeast of Niamey.

In January, Niger joined France and Chad in the first meeting of the Common Organization of the Saharan Regions, held in Tamanrasset, Algeria.

J. L. L.

NIGERIA

The Federation of Nigeria is the world's most populous Negro nation, situated in western Africa on the Gulf of Guinea. Total area: 356,669 square miles; population (mid-1962 est.), 36,473,000. The federation has three autonomous regions (with areas and mid-1961 est. populations): Northern (281,782 square miles; pop., 19,877,000, including former Northern Cameroons, which became a province of Nigeria on June 1, 1961); Eastern (29,484 square miles; pop., 8,377,000); and Western (45,376 square miles; pop., 7,119,000). The federal territory of Lagos (27 square miles; 1961 est. pop., 379,000) is the capital and chief port. Other principal cities (with mid-1960 estimates): Ibadan (600,000), capital of the Western Region; Kaduna (51,000), capital of the Northern Region; Enugu (63,000), capital of the Eastern Region; Ogbomosho (140,000); and Kano (130,000).

Government.—Nigeria attained independence within the Commonwealth of Nations on Oct. 1, 1960. The British crown is represented by a governor, Dr. Nnamdi Azikiwe (since Nov. 16, 1960). Prime Minister Alhaji Sir Abubakar Tafawa Balewa heads a cabinet which took office on Oct. 1, 1960. The federal legislature consists of a 44-member nominated Senate and a 312-member elected House of Representatives. Party seating in the House (following elections of Dec. 12, 1959): Northern People's Congress, 142; National Convention (formerly National Council), 89; Action Group, 73; and others, 8. Each region exercises considerable autonomy through its local government.

Education and Religion.—Most of the population is illiterate, and only about one fourth of all school-age children attend school. Education at the primary and secondary levels is the responsibility of the regional governments; the federal government maintains institutions of higher learning. Number of schools (enrollments, 1960): 16,047 primary (2,600,180); 514 secondary (85,411); 36 technical (6,346); 317 teacher-training (27,061); 4 universities (1,806). There are universities at Ibadan, Nsukka, Ife, and Kano, where the University of Northern Nigeria (with an enrollment of 430 students) was opened officially in October 1962. Principal religions: Islam (comprising an estimated 42% of the population in 1960); Protestantism (11%); Roman Catholicism (5%); paganism (42%).

Finance.—The Nigerian pound equals U.S.$2.80. Government receipts, fiscal year 1963 est.: £67 million; expenditure, £59.5 million. The budgetary surplus for fiscal year 1963 totaled £7.5 million (compared with £10.5 million for fiscal year 1962). Federal capital expenditure under the six-year development plan (1962–68) was estimated at £62 million for fiscal 1963. Foreign exchange holdings: $321 million as of June 30, 1960 ($358 million at the end of 1959).

Transportation and Communications.—Government railways comprise main lines from Lagos to Kano (700 miles) and from Port Harcourt to Kaduna (570 miles), and aggregate 1,770 miles of track. The road network of 37,844 miles includes 5,800 miles of all-weather highways. Nigerian Airways and six other main international airlines operate regular air services from Lagos and Kano. Other data for 1960: passenger cars, 43,600; commercial vehicles, 32,400; telephones, 41,661; radio receivers, 143,000; television sets, 10,000 (1962).

Agriculture.—Agriculture employs 75% of the labor force, accounts for over 50% of national income, and provides 85% of total export value. Nigeria is the world's largest producer of palm kernels and palm oil, and an important exporter of cocoa, peanuts and peanut oil, and rubber. Subsistence crops, principally maize, millet, yams, rice, and beans, account for some 80% of agricultural output. Chief cash crops and estimated outputs in the 1961–62 crop year: cocoa beans, 426.6 million pounds (down 1% from 1960–61); palm kernels, 462,966 short tons exported (down 1%); palm oil, 197,000 short tons exported (down 4%); peanuts, 1,375,000 short tons (up 8%); rubber, 55,800 metric tons (down 6%); cottonseed, 102,000 metric tons (up 70%).

Manufactures and Minerals.—Industrial production is based on palm oil extraction, cloth weaving, lumber milling, and the processing of other raw materials. Manufactures include cement (282,000 metric tons in 1961, or nearly double the output in 1960), plywood, plastics, aluminum ware, ceramics, textiles, soap, and cigarettes. Chief minerals and 1961 outputs (in metric tons): petroleum, 2,304,000 (more than double that in 1960); coal, 607,000 (up 6%); tin, 7,800.

Foreign Trade.—Total exports, 1961: £173.5 million (up 2% from 1960); imports, £222.0 million (up 3%). Exports of cocoa, palm kernels and oil, and peanut products provide about 65% of total export value. Chief imports are machinery, transport equipment, foods and beverages, textiles, fuels, and chemicals. Nigeria's principal customers are Great Britain (which took 45% of the country's total exports in 1961); the Netherlands (13%); and the United States (11%). Principal suppliers are Britain (which supplied 29% of Nigeria's imports in 1961); Japan (14%); and West Germany (7%).

Events, 1962.—As the African country having political institutions most similar to those of the Western democracies, Nigeria continued to experiment with a decentralized federal framework markedly dissimilar to the authoritarian one-party systems of other West African nations. The success or failure of Nigeria to develop its resources and industrialize its economy is of great importance to the future of political democracy in Africa, for failure will tend to encourage authoritarian tendencies in other African states, while success will perhaps encourage many of these states to emulate Nigeria's democratic example.

The nation's democratic institutions withstood a severe trial in 1962 as the result of a political crisis in the Western Region caused by a split between moderate and radical factions of the region's ruling Action Group party. The regional premier and leader of the moderates, Chief Samuel Akintola, was dismissed from office on May 21 by the regional governor, Sir Adesoji Aderemi, after the party's federal executive had asked him to resign because of alleged "maladministration" and "antiparty activities." Akintola's faction had differed on party tactics and policies with the more radical majority group, headed by Chief Obafemi Awolowo, leader of the Action Group opposition in the federal legislature.

As the result of Akintola's dismissal, rioting broke out in the regional legislature in Ibadan on May 25, and the federal government on May 29 declared a state of emergency in the region. Following the disorders, 15 political leaders were placed under detention. On July 7 the Supreme Court ruled that Akintola's dismissal was invalid because the legislature had not initiated proceedings to remove him as premier.

The federal government arrested 15 political leaders in Lagos on September 17 and 18, and later charged them and other associates with importing arms and ammunition to be used in an attempted plot to overthrow the government. Among those arrested were Chief Awolowo and other heads of opposition parties. Twenty-five persons accused of participating in the treasonable conspiracy went on trial in Lagos late in the year.

The creation of a fourth region of Nigeria, to be called the Mid-West Region and to be formed from the southeastern part of the Western Region, was approved in April by the federal legislature, and subsequently by the legislatures of the Eastern and Northern regions. The government of the Western Region opposed the measure, however, and initiated litigation which delayed enactment.

Nigeria's five-year development plan (1962–68) was introduced in the federal legislature on March 21. The plan intends to produce a self-sufficient and diversified economy at a total cost of $1.9 billion, of which about half was to be obtained from foreign sources. The key project is a multipurpose $190 million hydroelectric installation at Kainji on the Niger River. Preliminary work on the Kainji Dam was begun in late 1962.

The government's independent course in foreign affairs was underscored by the abrogation on January 21 of the British-Nigerian defense agreement of 1960. Both nations announced that the move was taken to alleviate fears that Nigeria's "freedom of action" might be impaired under the accord, which had provided for mutual defense.

Nigeria was host to a conference of the representatives of 20 African states, held in Lagos from January 25 to 30 (see AFRICA).

NOBEL PRIZES

The 1962 Nobel Prizes, each of which included prize money amounting to about $50,000, were officially presented on Dec. 10, 1962. This was the 66th anniversary of the death of Alfred Bernhard Nobel, who left the fund to establish the prizes, first awarded in 1901. In Stockholm, Sweden, King Gustav VI Adolf conferred the prizes in physics, chemistry, medicine and physiology, and literature. No Nobel Prize for peace was given in 1962. The Nobel laureates—who were named in October and November—and their achievements are discussed below.

Physics.—In 1962, Lev Landau became the fourth Russian to win the Nobel Prize in physics since it first was awarded in 1901. He was honored for having created "pioneering theories for condensed matter, especially liquid helium." Landau had studied the properties of helium II at close to absolute zero (−273.16°C.), developed a mathematical theory to explain its amazing superfluidity and superconductivity, and predicted its unusual "second sound" phenomenon, involving temperature waves rather than the compressional waves of ordinary sound. (See also PHYSICS.)

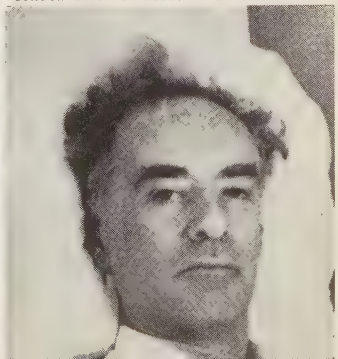
Lev Davidovich Landau was born in Baku, USSR, Jan. 22, 1908. He received his doctorate from Leningrad University in 1927 at the age of 19 and then worked with Niels Bohr (q.v.) in Copenhagen. In 1937 he was appointed head of the theoretical section of the Moscow Institute for Physical Problems, where he has worked with Peter Kapitza and made important contributions to the fields of quantum mechanics, nuclear physics, and cosmic radiation. On Jan. 7, 1962, he was severely injured in an automobile accident near Moscow and had not recovered sufficiently to go to Stockholm to receive his award.

Chemistry.—Max Perutz and John Kendrew of the Cavendish Laboratory, Cambridge University, were honored with the 1962 Nobel Prize in chemistry for their contribution to the understanding of life processes by being the first to determine the structures of complex globular proteins. Using X-ray diffraction techniques, Perutz had worked out the coiled structure of the molecule of hemoglobin, which transports oxygen in the blood, and Kendrew that of myoglobin, a simple form of hemoglobin found in muscle fibers.

Max Ferdinand Perutz was born in Vienna, Austria in 1914, emigrated to England in 1936, and received his doctorate from Cambridge University four years later.

(*Left*) Nobel laureates gather in Stockholm on December 10 to receive their prizes. From left are Dr. Maurice Wilkins of Great Britain, medicine; John Steinbeck of the United States, literature; Dr John C. Kendrew and Dr. Max F. Perutz of Great Britain, chemistry; and Dr. Francis H. C. Crick of Great Britain and Dr. James D. Watson of the United States, medicine. (*Right*) Lev Landau of the Soviet Union, winner of the physics prize, recovers in hospital from car crash injuries suffered on January 7.

LONDON DAILY EXPRESS: WIDE WORLD



Since 1947 he has been chairman of the Medical Research Council Unit for Molecular Biology at the Cavendish Laboratory.

John Cowdery Kendrew was born in Oxford, England, March 24, 1917. A graduate of Cambridge University (B.A. 1939; Ph.D. 1949), he worked for the Ministry of Aircraft Production during World War II, then became deputy director of the Molecular Biology Unit at Cambridge.

Medicine and Physiology.—Two British biophysicists and an American biologist shared the 1962 Nobel Prize in medicine and physiology for their determination of the molecular structure of deoxyribonucleic acid (DNA), the substance that controls heredity. The recipients of the award were Maurice H. F. Wilkins, Francis H. C. Crick, and James D. Watson. Working with Rosalind Franklin (d. 1958) at the University of London, Wilkins concluded from X-ray diffraction evidence that the submicroscopic DNA molecule in the nucleus of the living cell has the form of a double intertwined spiral. Using Wilkins' photographs and others, Crick and Watson, at Cambridge University, constructed a spiral model of the DNA molecule and described its double-helical configuration as the device by which genetic information is assured of being passed on from one generation to another. Wilkins demonstrated later that this molecular model was correct. (See also BIOCHEMISTRY; GENETICS.)

Maurice Hugh Frederick Wilkins, born in New Zealand on Dec. 15, 1916, was trained in physics at Cambridge and Birmingham universities in England. During World War II he worked on the Manhattan (atomic bomb) Project at the University of California, Berkeley. Since 1946 he has been associated with the Medical Research Council's Biophysics Research Unit at King's College, University of London.

Francis Harry Compton Crick was born on June 8, 1916. A graduate of University College, London, and of Cambridge University, he was an Admiralty physicist during World War II and made important contributions to the development of radar. He has been with the Cambridge Unit for Molecular Biology since 1949. The Watson-Crick model of the DNA molecule was formulated in 1951–1952 and the results of the work published in 1953.

James Dewey Watson, born in Chicago, Ill., April 6, 1928, received the Nobel award for work done when he was 25. He graduated from the University of Chicago in 1947 and obtained his doctorate from Indiana University in 1950 for research on bacterial viruses. After a year of further work in Copenhagen, he went to Cambridge, England, where he collaborated with Francis H. C. Crick on their award-winning research. Later he moved to the California Institute of Technology and then (in 1955) to Harvard University.

Literature.—The 1962 Nobel Prize in literature went to John Steinbeck for his "realistic and imaginative writings . . . distinguished by a sympathetic humor and a social perception." Steinbeck was the sixth American author to receive the honor. In the award announcement, the Swedish Literary Academy cited his novel *The Winter of Our Discontent* (1961) as a return to the "towering standards" of *The Grapes of Wrath* (1939), winner of the 1940 Pulitzer Prize for its epic treatment of Depression farm migrants. *The Winter of Our Discontent*, which American critics greeted with mixed enthusiasm, is a fable of the temptations of an honest man in a world of declining moral standards.

John Ernst Steinbeck was born Feb. 27, 1902, in Salinas, Calif., center of an agricultural region that forms the background of much of his fiction. His father was a county official and his mother a schoolteacher. He attended Stanford University, and until his success as a writer held various odd jobs so that he could travel and write. The first of his 27 published books was *Cup of Gold* (1929); however, he did not attain recognition until after the appearance of *Tortilla Flat* in 1935. *In Dubious Battle* (1936), *Of Mice and Men* (1937), and *The Grapes of Wrath* (1939) established his reputation as one of the leading "sociological" novelists in the United States. His most recent book, *Travels with Charley; In Search of America*, was published in 1962.

NORTH ATLANTIC TREATY ORGANIZATION

Any survey of the activities of NATO within a given period must have regard both to the more or less routine pieces of information that testify to the day-to-day business of an organization in being, and also to such indications as there may be of long-term changes either pending or actually taking place.

New Commands and Appointments.—The year 1962 saw the coming into operation of a new military command as a part of the NATO structure. This was the Allied Command, Baltic Approaches (BALTAP), established within the existing command CINCNORTH (Commander-in-chief, Allied Forces, Northern Europe). The creation of the command, which was announced on Dec. 8, 1961, was activated and developed during 1962. Lt. Gen. Tage Andersen, Royal Danish Air Force, was named as first commander, with Maj. Gen. Peter von der Groeben of the German Army as his deputy. The command consists of a headquarters and four subordinate commands: land forces in Schleswig-Holstein and Jutland; land forces in Zeeland; naval forces; and air forces. The new command, which had been under discussion for three years, was made possible by the development of the German Army, and it will divide up the inconveniently large responsibility of CINCNORTH, which is based in Oslo, Norway.

The new command was protested by the Soviet Union, which professed to see it as "a new and most dangerous step encouraging Hitler's former generals and admirals in their predatory designs," and which also hinted that it prejudiced the neutrality of Sweden and Finland. The Danish reply said that "the participation in NATO of the Federal Republic of Germany does not alter the purely defensive nature of the alliance. . . . The unified command now brought into being is a NATO command, which will permanently have a Danish commander-in-chief. . . ."

Among personnel changes may be mentioned those in the Standing Group of the Military Committee and in the North Atlantic Council. On Jan. 1, 1962, Lt. Gen. Jean Marie Guerin of the French Army assumed duty as Standing Group representative to the North Atlantic Council, succeeding Maj. Gen. R. H. Barry of the British Army. Also at the beginning of the year there was a change in the honorary presidency of the North Atlantic Council, according to the principle of annual alphabetical rotation by countries. Selim Sarper, foreign minister of Turkey, succeeded Alberto-Franco Nogueira of Portugal, but, due to political changes in Turkey, Sarper was replaced in April by the new foreign minister, Feridun Cemal Erkin.

Resignation of Norstad.—By far the most important of the NATO personnel changes of 1962—and one of the most important to occur for many years—was the resignation of Gen. Lauris Norstad (United States) as Supreme Allied Commander, Europe (SACEUR). Norstad, who had filled this post with distinction since 1956, submitted his resignation to President Kennedy, who accepted it on July 20. Five days later, the North Atlantic Council approved as Norstad's successor Gen. Lyman L. Lemnitzer, who had been nominated by Kennedy, and who at the time of his selection was chairman of the U.S. Joint Chiefs of Staff. Norstad

had expressed a desire to be relieved of his duties about November 1, but because of the Cuban crisis in late October the NATO Council, in agreement with Kennedy, decided to keep Norstad in his post until the turn of the year. Lemnitzer took over the command on Jan. 2, 1963.

Algeria.—One of the little-noted aspects of the attainment of independence by Algeria in 1962 was the fact that, for the first time, the integrity of the territory guaranteed by the North Atlantic Treaty had been breached. Article 6 states that "an armed attack on one or more of the Parties is deemed to include an armed attack on the territory of any of the Parties in Europe or North America, on the Algerian Departments of France. . . ." A neutralist and leftward-leaning Algeria in place of a French Algeria is certainly in one sense a loss to NATO; but the Algerian question had never been handled by NATO, and if its resolution meant that more French Army units would be available for European defense, there was a net gain.

Reassessments of Strategy.—Throughout 1962 a fundamental reassessment of NATO strategy was being carried on—one which was perhaps overdue, and which was being enforced by a basic change in the relative situations and power of the United States and western Europe. When NATO came into being in 1949, and throughout much of its first decade, the states of western Europe were wholly dependent on the United States strategically as well as economically. United States military policy was therefore accepted without much quibbling, because the only point that really mattered, in European eyes, was the existence of an absolute commitment on the part of the United States to defend western Europe against a Soviet attack.

By 1962 it was clear that such conditions had disappeared. The recovery of western Europe was complete and, at least within the Common Market, the region had a more buoyant economy than had the United States, even though its military strength was still far less, both relatively and absolutely. (See also EUROPE.) This situation was reflected in the growing demand for an independent nuclear striking force in Europe. The British already had one, which in the last resort was under the control of the prime minister, although there was little question that it would be used only in accordance with general NATO—and American—strategy. The French determination to obtain, at all costs, a nuclear force of their own raised more doubts, because there could be no such certainty regarding its eventual use or control.

The European arguments for a separate NATO nuclear force in Europe—or a French nuclear force—or (the most acceptable of these possibilities) a joint Anglo-French force—were not tenable on strategic grounds; but then, their basis was not logic, but pride. It was said that there were doubts that the United States would ever doom its cities to destruction for a European cause. But French President de Gaulle or British Prime Minister Macmillan would be even less likely to bring even more certain doom on Paris or London for a non-French or non-British cause—for example, Berlin.

However, the pressures arising from the new self-assertiveness of western Europe are not to be easily denied, and in the late summer and fall of 1962, Washington seemed to be fighting a not altogether successful rearguard action against what it clearly regarded as a serious or even fatal mistake, but one which in the end it might have to accept.

UPI

Gen. Lyman Lemnitzer (right) succeeds Gen. Lauris Norstad (left) as commander in chief of United States forces in Europe, at Paris, November 1. Norstad's retirement as NATO chief was postponed until 1963 owing to the Cuban crisis.

This was the tone of President Kennedy's remarks at his press conference on July 5, when he reluctantly opened the door to the possibility of a separate European nuclear deterrent:

". . . stronger pressures," the president said, "have arisen in Europe for a European nuclear force not as dependent upon the United States as the present one. What we have suggested is that this is a matter that Europe should consider carefully; that we would, of course, be responsive to any alternative arrangements that they wish to make. . . ." Kennedy said that the United States regarded the present arrangement under NATO as giving "full and sufficient guarantees for the integrity of Europe." He added, however, that "if Europe does not agree with that . . . then we'd be prepared to discuss an alternate arrangement."

Ministerial Meetings of the Council.—The steps taken at the regular spring ministerial meeting of the North Atlantic Council, held at Athens, May 4–6, must be viewed in relation to this background. The major item which emerged from the meeting was the assignment to NATO use of the five nuclear-armed Polaris submarines based on the Holy Loch, near Glasgow, Scotland. This was in accordance with the American offer made a year earlier. The vessels, however, are still under American, not joint, command, and the gesture was no more than a symbol of the American commitment.

The Athens meeting also began to deal with the desirability of achieving a better balance between nuclear and conventional forces in NATO, thus strengthening the possibility of local European defense with nonnuclear weapons. Every strategic expert is now convinced of the necessity of this step, but the difficulty is to get the European allies to provide the necessary manpower. This difficulty had by no means disappeared by the time the annual year-end ministerial meeting of the Council was held in Paris from Dec. 13 to 15, 1962, but the final communiqué did speak of the intention to increase the effectiveness of the alliance's conventional defenses.

NORTH CAROLINA

A South Atlantic state of the United States, North Carolina ranks 28th among the states in area (land, 49,067 square miles; inland water, 3,645) and 11th in population (4,731,000 on July 1, 1962, a 3.8% increase from the 1960 census figure of 3,556,155). Urban places with populations above 15,000 in 1960:

Asheville	60,192	Kinston	24,819
Burlington	33,199	Lexington	16,093
Charlotte	201,564	Lumberton	15,305
Concord	17,799	New Bern	15,717
Durham	78,302	Raleigh (*capital*)	93,931
Fayetteville	47,106	Rocky Mount	32,147
Gastonia	37,276	Salisbury	21,297
Goldsboro	28,873	Shelby	17,698
Greensboro	119,574	Statesville	19,844
Greenville	22,860	Thomasville	15,190
Hickory	19,328	Wilmington	44,013
High Point	62,063	Wilson	28,753
Kannapolis (uninc.)	34,647	Winston-Salem	111,135

Government.—Chief executive and judicial officers in 1962 included Terry Sanford (Democrat), governor, serving a four-year term; lieutenant governor (vacancy); Thad Eure, secretary of state; Edwin Gill, treasurer; Henry L. Bridges, auditor; T. Wade Bruton, attorney general; Charles F. Carroll, superintendent of public instruction; and Emory B. Denny, chief justice of the 7-member Supreme Court.

The North Carolina General Assembly, which convenes in odd-numbered years, comprised 48 Democrats and 2 Republicans in the Senate in 1962 and 105 Democrats and 15 Republicans in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $759,696,557 included $509,570,110 from state taxes and $130,545,407 in federal funds. Chief tax yields were the 3% general sales tax ($131,215,914) and taxes on individual incomes ($95,453,963), corporate incomes ($54,668,337), and motor fuels ($108,520,991). Spending of $754,448,040 included $321,056,542 for education, $145,482,002 for health, welfare, and safety, and $181,365,668 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 27,967 teachers enrolled 857,500 pupils; secondary schools with 10,934 teachers enrolled 285,500; and parochial schools with 480 teachers enrolled 12,379. College enrollment totaled 77,481.

Estimated public school spending in the 1961–62 school year totaled $357,950,000, including current expenditures of $303 million ($290 per pupil) and capital outlays of $44 million. Revenue of $377 million was drawn chiefly from state funds ($247 million) and local districts ($86 million). Teachers' salaries averaged $4,877 (high school, $4,998; elementary, $4,820). Actual spending for higher education (1961 fiscal year) amounted to $71,991,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 189,601 persons totaled $69,060,615. This amount included $24,870,171 for the aged and $27,805,719 for dependent children.

Transportation and Communications.—A total of 614 miles of federally aided highway construction and reconstruction were completed in the 1961 fiscal year. *Highways, roads, and streets* on Jan. 1, 1961, totaled 80,913 miles (44,813 surfaced). These served 1,900,003 *motor vehicles* (as registered on July 31, 1962), including 1,352,283 automobiles. Operating in the state were (1961) 29 *railroads* (using 4,450 line miles of track); (1962) 5 regularly scheduled *airlines;* and 105 commercial and municipal *airports* and 1 heliport.

Communications media included (1962) 157 AM and 49 FM *radio stations;* 12 VHF *television stations;* 51 daily *newspapers* (circulation, 1,214,954) and 142 other newspapers (394,326); and (January 1) 325,300 business and 936,700 residential *telephones.*

Labor Force.—Nonagricultural employment in manufacturing establishments averaged 1,200,100 in 1961, compared with 1,195,500 in 1960. Of nonfarm employees in 1961, 42.2% were in manufacturing, 18.1% in trade, and 14.2% in government services. Insured unemployment during 1961 stood at 47,200, compared with 38,000 for 1960.

Manufacturing.—Manufacturing engaged 496,559 workers in 1960, including 420,694 in production, and provided a payroll of $1,740,576,000.

LEADING NORTH CAROLINA MANUFACTURES, 1960

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Textile mill products	217,427	$695,521	$1,231,464
Food and kindred products	34,084	119,206	276,936
Furniture and fixtures	45,179	151,459	275,782
Chemicals and products	12,826	63,481	200,417
Apparel and related products	34,083	83,790	137,050
Paper and allied products	12,094	64,870	113,080
Lumber and wood products	30,107	65,755	108,949
Nonelectrical machinery	11,021	45,038	90,475

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Adjusted value added by manufacture amounted to $3,760,774,000.

Mining.—In 1961, North Carolina ranked 39th among the states in the value of its mineral production, with 0.28% of the national total. Tungsten output rose over 75% from 1960, as the mines were worked for the first full year. The state ranked first in feldspar, scrap mica, and sheet mica, and second in olivine and tungsten. About half of the total value of $50,124,000 was accounted for by stone.

Agriculture.—Cash farm income in the first nine months of 1962 (excluding government payments) totaled $700,796,000, compared with $755,310,000 for the corresponding period of 1961. For the full year 1961, income comprised $322,300,000 from livestock, $800,300,000 from crops, and $32,012,000 in government payments. Principal income sources in 1961 were tobacco, $556,339,000; broilers, $82,369,000; wholesale milk, $66,240,000; and eggs, $65,989,000.

The state's 191,000 farms in 1959 had an acreage of 15,888,000 (4,746,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 907,000 cattle, 1,279,000 hogs, and 14,426,000 chickens, and (1961) 183,200,000 broilers. An average of 309,000 family and 104,000 hired workers engaged in farming in 1961.

NORTH CAROLINA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	1,554	2,300	2,700
Corn for grain (1,000 bu.)	65,515	66,384	72,632
Cotton lint (1,000 bales)	368	278	275
Peaches (1,000 bu.)	1,170	1,500	1,500
Peanuts (1,000 lb.)	293,962	309,760	347,600
Potatoes (1,000 cwt.)	3,384	3,549	2,802
Soybeans (1,000 bu.)	7,307	13,064	13,392
Tobacco (1,000 lb.)	866,758	853,951	928,700
Wheat (1,000 bu.)	8,078	11,368	4,896

(Source: U.S. Department of Agriculture.)

Events, 1962.—North Carolina had one of the most exciting off-year elections in its history as the Republican Party, for the first time in many years, waged an intensive campaign for offices at all levels. In the Republican primary in May, Claude L. Greene, Jr., won the nomination for United States senator over Charles H. Babcock, Jr. In the 6th, 9th, and 11th Congressional District primaries, the successful candidates were Blackwell P. Robinson, James T. Broyhill, and Robert Brown, respectively. In the Democratic primaries in the 3d, 5th, 6th, and 8th districts, the four incumbents —David N. Henderson, Ralph J. Scott, Horace R. Kornegay, and A. Paul Kitchin, respectively—were renominated. The only close contest was in the new 8th District, where Kitchin defeated John P. Kennedy by about 1,800 votes.

In the November election, Republican Charles R. Jonas, incumbent representative from the old 10th District, defeated Kitchin, incumbent from the old 8th District. (The revisions were brought about when the number of districts were reduced from 12 to 11.) In the new 9th District, Broyhill defeated Democratic incumbent Hugh Q. Alexander by a margin of slightly more than 1,000 votes. Thus, for the first time in 30 years, North Carolina was to have two Republicans in Congress. Democratic incumbents were reelected in the nine other congressional districts, though by small margins in the 10th and 11th. Sen. Sam J. Ervin, Jr., was reelected, and the Democrats were victorious in all of the contests for state offices.

The Republicans boosted their strength in the 120-seat House of Representatives from 15 to 22 seats; in the state Senate, Republican strength remained at 2 of the 50 seats. The most startling

upset occurred in Guilford County, where Republican candidates for the legislature captured the Senate seat and all four seats in the House of Representatives.

Six amendments to the state constitution were approved by the electorate by heavy majorities. These concerned: (1) revision of the state court system; (2) a procedure for the automatic reapportionment of the state House of Representatives by the speaker after each federal census; (3) clarification of the provisions "controlling succession to the office of governor and lieutenant governor upon death, resignation or removal from office, or temporary physical or mental incapacity"; (4) authorization for the General Assembly to reduce the residence requirement for voting in presidential elections; (5) authorization for the General Assembly to fix and regulate the salaries of elective state officers constituting the Council of State and the Executive Department during their terms of office; and (6) clarification of the General Assembly's powers to provide for a uniform statewide classification and exemption of property for taxation.

In March the chief justice of the state Supreme Court, J. Wallace Winborne, retired and was succeeded by Associate Justice Emery B. Denny. To fill the vacancy, Governor Sanford appointed Susie Sharp, previously special judge of the Superior Court, who thus became the first woman to serve on the state's highest court.

In November, Dr. Douglas Maitland Knight was named president of Duke University, succeeding the interim president, Dr. Deryl Hart.

NORTH DAKOTA

A North Central state of the United States, North Dakota ranks 17th among the states in area (land, 69,457 square miles; inland water, 1,208) and 44th in population (642,000 on July 1, 1962, a 1.5% increase from the 1960 census figure of 632,446). Urban places with populations above 7,500 in 1960:

Bismarck (*capital*)	27,670	Mandan	10,525
Dickinson	9,971	Minot	30,604
Fargo	46,662	Valley City	7,809
Grand Forks	34,451	Williston	11,866
Jamestown	15,163		

Government.—Chief executive and judicial officers in 1962 included William L. Guy (Democrat), governor, serving a two-year term; Orville W. Hagen, lieutenant governor; Ben Meier, secretary of state; John R. Erickson, treasurer; Curtis Olson, auditor; Leslie R. Burgum, attorney general; M. F. Peterson, superintendent of public instruction; and P. O. Sathre, chief justice of the 5-member Supreme Court.

The North Dakota Legislative Assembly, which convenes in odd-numbered years, comprised 28 Republicans and 21 Democrats in the Senate in 1962 and 72 Republicans and 41 Democrats in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $117,782,563 comprised $116,196,297 from state sources and $1,586,266 in federal funds. Chief tax yields were the 2% general sales tax ($13,445,836) and taxes on individual and corporate incomes ($7,559,170) and motor fuels ($17,599,911). Spending of $119,947,933 included $29,131,873 from the general fund and $34,239,328 from the highway fund.

Education.—In the 1960–61 school year, public elementary schools staffed by 4,577 teachers enrolled 103,380 pupils; secondary schools with 2,391 teachers enrolled 37,086; and private and parochial schools with 747 teachers enrolled 19,553. College enrollment (fall 1961) totaled 14,201 in 13 institutions, including 5 junior colleges and 8 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $65,525,000, including current expenditures of $50,700,000 ($390 per pupil) and capital outlays of $12,750,000. Revenue of $70 million was drawn chiefly from state funds ($14.5 million) and local districts ($41 million). Teachers' salaries averaged $4,150 (high school, $4,850; elementary, $3,800). Actual spending for higher education (1961 fiscal year) amounted to $19,501,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 18,339 persons totaled $13,786,264. This amount included $6,658,479 for the aged and $3,420,254 for dependent children.

Transportation and Communications.—There were 1,834 miles of highway reconstruction completed in 1961. *Highways and roads* on Dec. 31, 1961, totaled 102,274 miles (58,136 surfaced). These served 363,362 *motor vehicles* (as registered on Aug. 31, 1962), including 225,469 automobiles. Operating in the state in 1962 were 6 *railroads* (using 5,196 line miles of track); 3 regularly scheduled *airlines;* and 104 commercial and municipal *airports.*

Communications media included (1962) 26 AM *radio stations;* 11 VHF *television stations;* 10 daily *newspapers* (circulation, 163,631) and 107 other newspapers (163,236); and (January 1) 51,900 business and 157,800 residential *telephones.*

Labor Force.—The state's labor force on July 15, 1962, included 127,000 agricultural workers. Nonagricultural employment totaled 159,060, compared with 155,430 a year earlier and an average of 152,210 for the 12 intervening months. Of nonfarm wage and salary workers, 28% were in trade, 25% in government service, and 16% in service industries. Unemployment on July 15, 1962, stood at 9,120, compared with 9,150 a year earlier.

Manufacturing.—Manufacturing engaged 5,954 workers in 1960, including 4,226 in production, and provided a payroll of $25,079,000. Adjusted value added by manufacture totaled $59,535,000. The leading industry in 1960 was food and kindred products, with 3,009 employees who earned $12,032,000 in wages and added $26,599,000 in adjusted value by manufacture. (See below, *Events, 1962.*)

Mining.—In 1961, North Dakota ranked 31st among the states in the value of its mineral output, with 0.47% of the national total. Mineral fuels accounted for 90% of the total value, and lignite production continued its three-year uptrend. (See below, *Events, 1962.*)

NORTH DAKOTA MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quantity	Value
Clays	...[1]	$ ...[1]
Coal (lignite)	2,726,000	6,141,000
Natural gas (million cu. ft.)	20,100	2,533,000
Petroleum (1,000 bbl.)	23,568[2]	64,105,000[2]
Sand and gravel	9,395,000	7,507,000
Stone	40,000	40,000
Other minerals	...	4,371,000
Total	...	$84,697,000

[1] Figure withheld to avoid disclosing confidential data from an individual company. [2] Preliminary. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $449,337,000, compared with $365,176,000 for the corresponding period of 1961. For the full year 1961, income comprised $208,317,000 from livestock, $293,311,000 from crops, and $44,336,000 in government payments. Principal income sources in 1961 were wheat, $186,473,000; cattle, $126,031,000; and barley, $33,630,000.

The state's 55,000 farms in 1959 had an acreage of 41,466,000 (19,358,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, in-

NORTH DAKOTA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Barley (1,000 bu.)	70,489	45,334	99,365
Flaxseed (1,000 bu.)	18,266	8,262	18,912
Oats (1,000 bu.)	54,346	31,434	98,072
Potatoes (1,000 cwt.)	11,119	13,970	14,820

cluded 1,881,000 cattle, 275,000 hogs, 715,000 sheep, and 2,595,000 chickens. An average of 70,000 family and 17,000 hired workers engaged in farming during 1961. (See below, *Events, 1962.*)

Events, 1962.—North Dakota recorded its greatest wealth-producing year in history. The state's "new wealth" of nearly $1 billion from four major sources in 1962 far surpassed the previous record established in 1958, and represented a gain of 33% over 1961, when a drought plagued much of the state.

Each wealth-producing industry established a new record during the year. Agriculture, always the largest industry in the state, accounted for 81% of the total, about $775,911,000, topping the previous record of $704,366,000 in 1948. The 1962 total includes more than $70 million in government payments.

The estimated value of oil and gas produced in 1962 was $71 million, compared with $64 million in 1961. Total estimated oil production for the year was 26 million barrels, gained from 91 producing pools in 78 oilfields. New oil wells brought in in 1962 totaled 87; dry holes drilled during the year, to December 1, totaled 95. The Portal Pipeline, the most significant development in the industry during the year, brought a 50-cent-per-barrel wellhead price increase to producers. The value of other minerals, including lignite, sand and gravel, clays, stone, and salt, amounted to $17.5 million.

The economy of North Dakota gained $63 million through manufacturing and processing in 1962, compared with $59,535,000 in 1961. The State Travel Department estimated that tourist income during the year increased 10%, to $32 million. A survey showed that more tourists visited the parks, recreation areas, and historic sites, and that they stayed longer than in previous years. Many persons en route to the World's Fair in Seattle traveled by way of North Dakota, which has made excellent progress in its development of superhighways.

North Dakota gained 20,174 nonagricultural jobs in the decade ending in 1962. Employment growth in the state's towns and cities was a substantial 15.6%, only 2.6% less than the national average. There were gains in the oil industry, in wholesale and retail trade, in personal and business services, and in finance, insurance, and real estate. Job losses were reported in railroading, lignite mining, and meat-packing.

Democratic Gov. William L. Guy was reelected to his second term in the November 6 election, but by a scant margin of less than 2,000 votes over Mark Andrews, 36-year-old Republican national committeeman. In the race for a U.S. Senate seat, Republican Milton R. Young, who has served since 1945, won easily from William Lanier, a Fargo attorney. Both Republican congressmen were returned to office. On the state level, Republicans won all other offices except that of governor, and increased their majorities in both houses of the state legislature.

A reapportionment plan adopted by a special state commission appointed in 1961 was ruled inequitable and therefore void by the state Supreme Court. The previous apportionment remained in effect.

"Events" by: C. W. Leifur,
Principal, Bismarck (N.Dak.) High School.

NORTHERN IRELAND

Northern Ireland's six counties and two county boroughs (land area, 5,242 square miles) form an integral part of the United Kingdom of Great Britain and Northern Ireland. At the 1961 census the population totaled 1,425,400, distributed as follows (provisional figures): Antrim, 690,000 (including Belfast county borough, 416,100); Armagh, 117,600; Down, 267,000; Fermanagh, 51,600; Londonderry, 165,300 (including Londonderry county borough, 53,700); and Tyrone, 133,900. Belfast is the capital city and chief port.

Government.—Lord Wakehurst, who assumed office as governor on Dec. 3, 1952, was reappointed for a second 6-year term in 1958; he is advised by ministers responsible to Parliament, which consists of a 52-member House of Commons and a 26-member Senate. Northern Ireland also elects 12 members to the United Kingdom House of Commons.

Education and Religion.—Schools and enrollments, 1960–61: 1,510 primary (189,610 pupils); 116 secondary intermediate (54,192 pupils); 31 technical intermediate (4,317 pupils); 81 grammar (38,546 pupils); 20 special (1,579 pupils); and 164 centers of higher education (35,512 students). Student enrollment at Queen's University, Belfast, was 4,225; at Magee University College, Londonderry, 252. In 1961, Protestants numbered 899,000; Roman Catholics, 498,000 (an increase of 5.6% since the 1951 census).

Finance.—Revenue, 1962–63 est.: £126,941,000 (£110,952,000 from taxes); expenditure, £119,387,800 (supply services, £108,520,800). Northern Ireland's contribution to the British Exchequer was £7.5 million; the budget surplus was estimated at £53,200. Public debt: £91,022,572 as of March 31, 1961.

Transportation and Communications.—Road mileage, 1962: 13,809 (trunk roads, 381). Rail traffic is conducted by the Ulster Transport Authority. British European Airways and private operators maintain air services with Great Britain. The first section of a 40-mile motor highway between Belfast and Dungannon (costing £10 million) was opened in July 1962. Passenger cars (1959): 115,300; commercial vehicles, 36,300.

Economic Indicators.—Employed persons (mid-1962): 204,700 (up 5,100 from 1961); unemployed, 36,900 (7.2% of the work force; down 0.9% from 1961). Net value of production, 1960: £593 million (up 10.5% from 1959). National Insurance Act contributors, 1961: 569,000 (receipts, £24,961,000; payments, £26,681,000).

Manufactures and Mining.—Over 200,000 persons are employed in manufacturing (including 54,000 in textile industries in 1962), engineering, and shipbuilding (55,000 in 1961); 2,416 were employed in mines and quarries in 1960. Sales of electricity to 350,334 consumers, 1960–61: 1,374 million units.

Agriculture.—Acreage (in thousands) of chief crops, 1961 (provisional): oats, 173 (down 29 from 1960); barley, 110 (up 51); and potatoes, 73 (down 14). Livestock (in thousands): cattle, 1,064; sheep, 1,168; pigs, 1,067; poultry, 10,740; and horses, 10.

Foreign Trade, 1961.—Total exports, £342 million; imports, £383 million. Great Britain took 91% of exports. Linen exports exceeded £12 million.

Events, 1962.—A general election was held on May 31. The Unionist Party, which had controlled the government for 41 years, was returned to power with 34 seats—a loss of two from the party's strength in the Parliament dissolved on May 9. Although the Northern Ireland Labor Party gained one of eight Belfast seats and recorded an increased total vote, it failed to increase its parliamentary representation of four.

Economic problems were the principal election issue. The prime minister, Viscount Brookeborough, emphasized during the campaign that his government had helped 130 domestic companies to expand and 170 foreign businesses to begin operations in Northern Ireland. The latter companies included three American firms in 1962, one of them a subsidiary of the International Telephone and Telegraph Corporation.

A new £75,000 extension to the physics department of Queen's University, Belfast, was opened by the queen mother. The new facilities are equipped for modern research, including work on nuclear energy and cosmic rays.

NORTHERN RHODESIA. See Rhodesia and Nyasaland.

NORTHWEST TERRITORIES

Comprising 1,304,903 square miles, slightly less than 34% of Canada's total area, the Northwest Territories includes all of the Canadian mainland north of the 60th parallel except the Yukon Territory and parts of Quebec and Newfoundland. The Territories includes islands in Hudson, James, and Ungava Bays, as well as the entire Arctic Archipelago. For administrative purposes it is divided into three districts: Mackenzie (527,490 sq. mi.), Keewatin (228,160 sq.mi.), and Franklin (549,253 sq. mi.). In 1962 the population was estimated at 23,000, of which 38% was Eskimo and 22% was Indian.

Government.—The Northwest Territories is governed by a commissioner (R. G. Robertson in 1962) acting on instructions from the governor in council or the minister of northern affairs and national resources. Legislative powers are exercised by a Council of 9 members with a normal 3-year term of office. Five councillors are appointed, and 4 elected from constituencies in the Mackenzie District. (Administration is by the Department of Northern Affairs and National Resources.)

Education.—In 1962 the Department of Northern Affairs and National Resources operated 42 schools in the Territories, and assisted in the operation of 1 company school, 3 part-time schools, and 1 seasonal school. Public and separate school boards operated 1 school each in Yellowknife. Total enrollment as of March 31, 1962, was 4,873, of whom 1,631 were Eskimos and 1,151 were Indians. Large residences, accommodating a total of 1,180 pupils, were maintained by the federal government at Inuvik, Fort McPherson, Fort Simpson, Fort Smith, Yellowknife, and Chesterfield Inlet. Family-type units accommodating 8 pupils each were maintained at Baker Lake, Eskimo Point, and Igloolik. Vocational training is also provided.

Public Health and Welfare Services.—Health and welfare services for all residents are provided by agencies of the federal and territorial governments. In 1962 there were 12 hospitals, 7 of which were operated by missions, 2 by companies, 1 by the locally elected hospital board of Yellowknife, and 2 by the Northern Health Service. The latter also operated 11 nursing stations. Rehabilitation centers are established at Frobisher Bay and Inuvik, and welfare services are provided by professional social workers.

Transportation and Communications.—The main water transportation route is provided by the Mackenzie River system, a waterway some 2,350 miles long stretching north and west to the Arctic Ocean. All-weather roads now total 361 miles, including the Mackenzie, Hay River, and Yellowknife highways. Approximately 20 miles of the all-weather Ingraham Trail from Yellowknife to MacKay Lake was completed in 1962. These roads provide access to Enterprise, Hay River, Fort Providence, Rae, and Yellowknife from southern points. Secondary and local roads total 400 miles. There are 12 airports operated by the Transport Department, 6 airfields owned and operated by mining companies, and 49 water aerodromes. Regular mail and passenger services are maintained to many points. Telephone communications have been established between southern Canada and Fort Smith, Hay River, and Yellowknife in the Mackenzie District and Frobisher Bay on Baffin Island. There are radio stations in the larger towns.

Production and Industry.—Extraction of minerals ($19,992,484 in 1961, compared with $26,481,649 in 1960) continues to be the mainstay of the economy. Gold was the biggest revenue producer among the minerals: 402,580 ounces, valued at $14,267,435, were produced in the Yellowknife area in 1961. Other minerals produced in 1961 included: pitchblende, $2,782,000; nickel, $2,600,000; copper, $272,000; and silver, $71,049. The development of 1 million tons of high-grade tungsten ore in the Flat River area is under way. As of Aug. 31, 1962, companies held oil and gas exploratory permits on 52,354,614 acres of mainland, 52,136,785 acres in the islands north of the 70th parallel, and 18,962,428 acres on the continental shelf. In 1961, 516,979 barrels of crude petroleum were produced.

Fur production in 1961 amounted to 316,340 pelts, valued at $1,319,748. Commercial fisheries on Great Slave Lake produced a total of 5,688,964 pounds, principally lake trout and whitefish, with an estimated market value of $1,314,951. More than 15 million feet of lumber was produced at an estimated value of $1 million. The territories had some 2,000 tourists in 1961.

Events, 1962.—On February 12, construction was begun on the 438-mile Great Slave Lake Railway. This is the first railway to cross the 60th parallel into the Northwest Territories; it will bring extensive lead-zinc deposits of Pine Point into production and open up 6 million acres of arable land for homesteading.

WIDE WORLD

King Olav V of Norway (second from left) inspects guard at Edinburgh Castle, October 16, on state visit to Scotland.

Active exploration for minerals, oil, and gas continued during 1962. Impressive deposits of high-grade iron ore were found along the Yukon-Northwest Territories border, and plans were made to construct an airstrip and winter road into the area. Following the discovery of a rich occurrence of gold, claims were recorded in the Contwoyto Lake area. An extensive area of oil-saturated sands was discovered in the northwestern area of Melville Island in August.

The summer session of the Northwest Territories Council was held at Cape Dorset in the eastern Arctic. The decision was made to recommend Fort Smith as the capital of the proposed Mackenzie Territory.

The development of Eskimo cooperatives in the Arctic part of the Territories continued; 10 cooperatives are engaged in business operations based on commercial fishing, handicrafts, tourism, graphic art, lumbering, and the operation of small retail stores. The first shipment of Arctic char was sent to Great Britain in the summer of 1962. A gross profit of about $800,000 was expected for the 10 enterprises in 1962.

R. G. Robertson,
Commissioner, Northwest Territories.

NORWAY

The constitutional monarchy of Norway (*Norge*), in northwestern Europe, has an area of 125,031 square miles (not including Svalbard[1]), of which only about 4% is arable, and a population (October 1962 est.) of 3,650,000. Principal cities and populations (Jan. 1, 1962, est.): Oslo, the capital (482,000); Bergen (117,000); Trondheim (60,500); and Stavanger (53,200).

Government.—The constitution of 1814, with amendments, provides for three separate branches of government. Legislative power is vested in the 150-member Storting, a modified unicameral parliament, elected every fourth year. Three fourths of its members constitute the Odelsting and one fourth the Lagting. The present Storting, elected Sept. 11, 1961, includes 74 Laborites, 29 Conservatives, 16 Centerites, 15 Christian Democrats, 14 Liberals, and 2 of the Socialist People's Party. Executive authority is vested in the king (since Sept. 21, 1957, Olav V) who exercises his power through a cabinet headed by a prime minister. (The present Labor cabinet is headed by Einar Gerhardsen.) There are presently 14 government ministries, whose heads are members of the cabinet. Judiciary power is centered in the Supreme Court.

Education and Religion.—School enrollment, 1959–60: 637,148. Number of schools (with enrollments 1959–60): 5,322 primary and continuation (481,777), 301 secondary (79,950), 71 folk high (4,968), 44 special (2,167), 563 vocational (58,786), 2 universities (6,632), 7 technical

[1] Svalbard is a Norwegian Arctic territory comprising the Spitsbergen archipelago and several other islands, with a total area of 24,101 square miles. The territory is administered by a governor residing at Longyearbyen, on West Spitsbergen. Both Norway and the Soviet Union operate coal mines in Spitsbergen.

colleges (2,868). Principal religion: Evangelical Lutheran State Church (96% of population).

Finance.—Government revenue, 1963 est.: Kr. 8,346 million; expenditure Kr. 9,435 million. Total financing needs: Kr. 1,076 million. Net foreign debt, Jan. 1, 1962: Kr. 4,700 million (up Kr. 1,300 million since Dec. 31, 1960). Net foreign exchange holdings, July 1, 1962: Kr. 2,886 million (down Kr. 477 million since Jan. 1, 1962). Deficit on balance of payments (January–July, 1962): Kr. 910 million.

Transportation and Communications.—State-owned railways (miles, 1961): 2,706 (1,048 electrified); public roads (miles, 1962): 28,972; merchant fleet (gross tons, July 1, 1962): 12,332,000. Most domestic air routes are operated by Scandinavian Airlines System. Motor vehicles (Jan. 1, 1962): 356,883 (218,500 private cars and 107,411 trucks and vans). Telephones (July 1, 1962): 669,398; radio receivers (Jan. 1, 1962): 1,021,451; television sets (Sept. 21, 1962): 156,383.

Economic Indicators.—Gross national product (1962): Kr. 38,870 million (up 4%). Index of industrial production and mining (July 1962): 99 points (1955 = 100). Consumer price index (July 15, 1962): 109.4 points (1959 = 100). Number of unemployed (Oct. 1, 1962): 7,800 (0.5% of labor force and 0.7% of all employed workers).

Manufactures and Minerals.—Chief industrial products (metric tons, 1959): wood pulp, 1,371,872; ores, 5,201,754; coal, 250,679; pig iron, 337,764; alloys, 287,626; aluminum, 145,949; hydroelectric power (1961–62) 37 billion kw.-hr.

Fishing and Whaling.—The total fish catch for January–June 1962 was about 439,000 tons (728,000 tons for the same period in 1961). Whale oil production during the 1961–62 Antarctic whaling season was 94,384 tons (23% below 1960–61).

Agriculture and Forestry.—Comprising 20.6% of the labor force, agriculture and forestry account for 8.5% of the gross national product. Chief crops (tons, 1960): hay, 3,033,538; potatoes, 1,247,227; barley, 399,520; oats, 173,206; wheat, 22,942; rye, 3,694. Dairy production (metric tons, 1959): milk, 1,596,882; cheese, 38,509; butter, 14,870. Commercial timber (1961–62): 260 million cubic feet.

Foreign Trade.—Total exports, January–July 1962 (in million kroner): 3,946.2; total imports, 6,767.4. Principal exports: nonferrous metals, 710.5; fish and fish products, 442.3; paper, 383.6; wood pulp, 298.9; iron and steel, 253.4; ships, 198.7; chemical fertilizers, 194.4; other chemicals, 146.1; fats, 140.8; furs, 105.5. Principal imports: machinery, 1,168.3; ships, 882.7; fuels, 598.5; chemicals, 454.0; transport equipment (not ships), 422.5; iron and metal, 417.9; yarn and textiles, 358.1; ores, 323.7; instruments, 244.2; vegetables, 199.1; grains, 172.0. Chief customers (in million kroner for January–June 1962): Great Britain, 592.3; West Germany, 456.9; Sweden, 416.3; United States 393.9; European Free Trade Association (EFTA), 1,365.8; European Economic Community (EEC), 827.3. Chief suppliers: West Germany, 844.6; Great Britain, 792.6; Sweden, 672.3; United States, 458.2; Netherlands, 270.3; Denmark, 235.3; EFTA, 1,860.2; EEC, 1,570.5.

Events, 1962.—During 1962, Norway moved closer toward resolving the most crucial issue that it has faced since 1905—whether or not to seek a link with the European Economic Community. Parliament sanctioned a constitutional amendment that would permit the national assembly, by three-fourths majority, to transfer limited sovereign powers to a supranational organization. Next, on April 28, it authorized the government, by a vote of 113 to 37, to initiate negotiations with a view to full membership in the EEC. The decision came after months of heated public debate. Norway's declaration of intent, presented to the EEC Council of Ministers on July 4, expressed the special needs of Norway's agriculture and fishing industry. It was made clear that the result of negotiations, besides being subject to parliamentary approval, also would be submitted to an advisory referendum of the Norwegian people at large. Actual negotiations were not expected to start until Great Britain decided to join the EEC. Meanwhile, individual firms within the vulnerable home industry began to cooperate on sales and production techniques, as a means of strengthening their competitive position.

By the end of the third quarter of 1962, the economic situation was still marked by high activity and virtually full employment, though the rate of expansion was somewhat below the 1961 level. The main sources of concern were the creeping inflation, caused by the continuing price-wage squeeze, and the large deficits in foreign trade and the balance of payments. In an effort to keep price-wage developments within bounds, the government initiated regular consultations between the authorities and the national organizations of labor, industry, and agriculture due to negotiate new collective agreements during 1963. In addition, the government outlined a variety of fiscal and monetary anti-inflation tools, including a further limitation of credits through voluntary agreement. Several important export industries, notably wood and whale- and fish-oil processing, lagged.

The UN General Assembly, by 85 of the 109 total votes, elected Norway as a nonpermanent member of the Security Council for the 2-year term 1963–64. Norway was the first nation to buy United Nations bonds. Also, Norway pledged a nearly 50% increase in its 1963 contribution to the UN Special Fund and a 25% increase in the contribution to the UN Extended Technical Assistance Program.

King Olav V, sailing on the royal yacht *Norge*, paid state visits to France, September 25–29, at the invitation of President Charles de Gaulle, and to Scotland, October 16–20, where he was guest of Queen Elizabeth and the Duke of Edinburgh. Premier and Mrs. Einar Gerhardsen, at the invitation of President John F. Kennedy, paid an official visit to the United States, May 9–14.

Parliament approved a 25% increase in old-age pension benefits, together with higher premium rates. It also amended the Vacation Act, which assures workers a 3-week annual holiday with pay, so as to increase the vacation pay from 6.5% to 7.5% of yearly earnings. The Labor Party, which has been the ruling party in Norway since 1935, marked its 75th anniversary in 1962.

At the request of Parliament, a five-member committee of legal experts submitted a 550-page unevaluated report on the treason trials conducted in Norway after World War II, in which 54,241 persons were indicted.

The Norwegian Zero Energy Reactor Assembly, the nation's third experimental reactor, was dedicated at Kjeller. On Andøya island, in North Norway, the Norwegian-Danish space research program was started with the successful launching of a Nike-Cajun rocket, carrying 66 pounds of instruments. The nation's growing electronics industry received international recognition when NATO designated Norway as prime contractor for the production of several thousand Bullpup air-to-surface missiles, with Great Britain, Denmark, and Turkey as subcontractors.

At Bodø, the North Norway railway was officially opened by King Olav, thus ending a 94-year fight to provide a rail link between North and South. California Texas Oil Company and the Soviet Union sent large geological expeditions to search for oil in the Norwegian-governed Arctic archipelago of Spitsbergen.

In Stavanger, the keel was laid for the first of two mammoth 80,000-ton oil tankers to be built for the Norwegian firm of Sigval Bergesen, Jr. Sford shipyards expanded its facilities in order to build ships of up to 150,000 tons.

ANDREW MOURSUND,
Editor, "News of Norway,"
Norwegian Embassy, Washington, D.C.

NOVA SCOTIA

This Maritime province of southeastern Canada has an area of 21,068 square miles, of which 14,439 are forest land, 1,034 improved agricultural land, and 325 fresh water. For its relatively short length of 374 miles, Nova Scotia has an astonish-

ing length of coast—some 4,600 miles. The population of the province is 746,000 (est. July 1962), an increase of 1% since the 1961 census of 737,007. The metropolitan area of Halifax-Dartmouth has a population of 183,000. Other centers, with estimated 1962 populations are: Sydney, 33,600; Glace Bay, 24,200; Truro, 12,400; New Glasgow, 9,800; Yarmouth, 8,600.

Government.—The province is represented in the federal Parliament by 10 senators (appointed for life), and has 12 members in the elected House of Commons. In 1962, as a result of the general election in June, Nova Scotia is represented by 9 Progressive Conservative members, 2 Liberals, and 1 New Democratic Party.

The province is administered by a lieutenant-governor, appointed for 5 years by the federal government. The incumbent in 1962 was Maj. Gen. E. C. Plow, appointed in 1958, and advised by a cabinet headed by Premier Robert L. Stanfield. The cabinet is responsible to a 43-member House of Assembly, in which the Progressive Conservatives hold 27 seats, the Liberals, 15, and the New Democratic Party, 1.

Education.—In September 1962, the estimated enrollment in the public schools was about 190,000. Education accounts for about 25% of the ordinary government expenses of the province. There are several universities, notably Dalhousie, in Halifax; St. Francis Xavier, in Antigonish; and Acadia, in Wolfville.

Finance.—Estimated revenue for the fiscal year 1962–63 was $108,119,127; estimated expenditure, $100,405,190, plus sinking fund payments of $9,273,450. Nova Scotia's net direct debt as of March 31, 1961, was $170,784,502.

About 15% of present provincial revenue comes from a 5% sales tax to be applied for support of the provincial hospital scheme.

Communications.—The province has about 1,400 miles of railway. In 1962 there were 15,400 miles of road, of which 3,360 were paved. In the decade 1950–60, Nova Scotia spent some $100 million on highways, of which $19 million was supplied by the national government for the Trans-Canada Highway.

Agriculture.—Farm cash income for 1961 was $45.7 million, a 4% increase over 1960, and gross agricultural income was $56.5 million. The large apple crop in 1961 totaled 3.1 million bushels; the 1962 crop was estimated at 2.5 million bushels. About 15% of the apple crop is sold in Great Britain, about 7% in continental Europe.

Mining.—Mineral production in 1960 was valued at $59,545,000, a decrease of some 10%. Coal production (at 4.3 million tons) was down slightly, and gypsum (4 million tons) was down 10%.

Manufacturing.—The gross value of manufacturing in 1960 was $410 million. Chief manufactures were foods and beverages, followed by iron and steel products.

Fishing.—The 1961 saltwater fish catch was 456,955,000 pounds, with a landed value of $27,947,000. (Market value is about double the landed value.) Lobsters and scallops comprise a very substantial part of the industry: 19,782,000 pounds of lobster were landed, valued at $8.8 million, and 10,435,000 pounds of scallops, valued at $3 million. The value of scallops increased 50% over 1960.

Forestry.—Pulpwood production in 1961 increased 41% over 1960, but sawn lumber declined by 16%. Christmas tree production continued about as before, but problems of marketing remained.

Tourism.—In 1961, about 631,000 tourists came to Nova Scotia, an increase of 8% over 1960. The tourist season in 1962 was handicapped by unusually wet weather. Visitors in 1962 may have been as numerous as in 1961, but the average visit was shorter, and the amount they spent will not match the $60 million spent in 1961.

Events, 1962.—In the June general election for the House of Commons of Canada, the Liberals won two seats and the New Democratic Party (formerly the Co-operative Commonweath Federation) won one. All 12 of Nova Scotia's seats had been held by the Progressive Conservatives, whose majorities were substantially reduced in the seven districts in which they won.

Cape Breton Island's lagging population growth reflected the economic difficulties arising from its failure to prevent the closing of mines.

Cocktail lounges, which were permitted for the first time in nearly 50 years by liquor laws enacted in 1961, have quietly appeared and been accepted.

A newsprint mill was scheduled for construction at Sheet Harbor. It will provide 90,000 tons of newsprint per year for Hearst newspapers.

NUTRITION

An important objective of the Food and Agriculture Organization of the United Nations (FAO) and of the World Health Organization (WHO) is the improvement of diets throughout the world. The development of appropriate programs and the evaluation of their success can be done only with adequate information about the nutritional requirements of the different populations living and working under varying conditions. Committees convened by FAO previously considered the requirements of calories and protein. A report in 1962 was directed toward calcium requirements.[1]

The problems associated with the development of nutritional standards for calcium are somewhat unique. On the one hand there is little convincing evidence of specific disabilities attributable to calcium deficiency; on the other, more people fail to consume the currently recommended amounts of calcium than those of any other nutrient. The recommended daily allowances of the Food and Nutrition Board of the National Research Council, which are the nutritional standards of the United States, provide an intake of 800 milligrams daily for adults and relatively more for children and for pregnant and lactating women. The average intake in the United States is believed to be about 800 to 900 mg. per person a day.

Milk and dairy products, the principal sources of calcium, ordinarily supply from 70 to 90% of the calcium in the American diet. Since milk is not a generally available food in many countries, most people of the world consume considerably less calcium. Average daily intakes range from those in the United States and a few other countries down to approximately 250 mg. per person in countries such as Japan. The problem of defining an adequate level of calcium intake would not be urgent except for its implications in large-scale programs. If intakes less than those recommended in the United States constitute a nutritional hazard, efforts to raise the intakes must be made. The only obvious method of achieving this would be through the widespread fortification of foods with calcium. Such programs are expensive and difficult to administer and cannot be justified unless there is a clear indication that they will improve the health of the populations toward which they are directed.

Previous estimates of calcium requirements have been based almost entirely on so-called calcium balance studies in which the amount of calcium eaten is compared with the amount excreted. If the amount excreted is larger than the amount eaten, calcium is being lost from the body; if it is less, calcium is being stored. By varying the intake it is possible to estimate the amount which must be consumed to equal that excreted. A normal adult is not growing and presumably needs just the amount which will prevent either serious loss or gain of calcium. Studies of this kind, done mostly in the United States and Europe, have indicated that the average individual needs about 700 mg., although some require considerably more.

This technic and interpretation may be questioned, however, since it is clear that many persons apparently develop normally and live long

[1] *"Report of an FAO/WHO Expert Group,* WHO Technical Report Series No. 230, 1962."

lives on much lower intakes. They must somehow adapt to the conditions under which they live. Calcium balance studies in areas where the intake is habitually low do, in fact, show that calcium balance is achieved at much lower intakes than those commonly consumed in the United States. Furthermore, studies in Norway have demonstrated that when the usual intake of a group of men was lowered, the excretion decreased after variable periods of time. Within a period of weeks or months the men adapted to the new level of intake and calcium balance was restored in most of the subjects.

Since most of the body calcium is in the skeleton, it would appear that calcium requirements should be relatively high during growth. The body of a new-born infant contains approximately 25 to 30 grams of calcium. The adult body is estimated to contain from 850 to 1,400 grams. Disregarding variations in growth, approximately 1,200 grams must be stored during the growth process; over a 20-year period, about 165 mg. of calcium a day would have to be retained in the body. There is much evidence that dietary calcium is not efficiently utilized, although this varies with the intake and the physiological state. The FAO/WHO expert group concluded from considerations of this kind that a safe intake would not be less than 400 mg. per day.

Examination of the clinical evidence for calcium deficiency led to the following major conclusions:

(1) No clear-cut evidence of calcium deficiency is apparent in children or adult men. In many areas of the world where calcium intakes are low, children grow more slowly and the final adult size may be less. There is no good evidence that this is due to calcium deficiency, since other factors—both nutritional and non-nutritional—which may affect growth are usually present. Nor is there good evidence that somewhat reduced rates of growth or smaller final size is a disadvantage. Continuing studies are required.

(2) It has been established beyond doubt that the development of rickets and dental caries is largely independent of calcium intake.

(3) In some countries with low calcium intakes, repeated pregnancies and long lactation have been associated with the development of osteomalacia. It is clear that this is not due solely to the calcium intake. It probably does not occur if exposure to sunlight or vitamin D intake is adequate, but a low calcium intake may be an exacerbating factor.

(4) Senile osteoporosis is a common disease of old age, thought by some to be associated with a diet deficient in calcium. The evidence is insufficient at present to support such a conclusion, but this is an important disease and much more investigation is required.

(5) There are some clinical conditions (hereditary diseases, steatorrheas, and various forms of renal disease) in which calcium absorption is very poor and calcium deficiency may be important.

(6) In the treatment of diseases of the skeleton, intakes of 600 to 800 mg. per day are adequate.

(7) The possible ill effects of high calcium intake require much more study. High intake may be detrimental in individuals susceptible to kidney stone formation, although there is no evidence that they are causative of this condition. Idiopathic hypercalcemia of infancy is a disease in which normal calcium intakes are toxic while the conditions last. Sarcoidosis, hypothyroidism, and idiopathic hypercalcuria are conditions in which overabsorption of calcium frequently occurs and which respond to a lowering of the calcium intake.

Another area in which calcium intake may eventually become important relates to the accumulation of radiostrontium in the body. There may be a possibility of diminishing the uptake and retention of radiostrontium by increasing the calcium intake. Other expert committees have been convened to specifically consider problems in this area.

In arriving at its conclusions, the FAO/WHO expert group utilized the term "suggested practical allowance," since it felt that there are insufficient data to permit an adequate definition of the minimum calcium requirement. The suggested practical allowance is defined as the intake at which the needs of the great majority of persons in any defined population group are likely to be adequately met. These were given as follows: birth to 12 months (children not breast fed), 500 to 600 mg. a day; 1 to 9 years, 400 to 500 mg.; 10 to 15 years, 600 to 700 mg.; 16 to 19 years, 500 to 600 mg.; adults, 400 to 500 mg.; and women during pregnancy and lactation, 1,000 to 1,200 mg.

It was recognized that intakes much higher than these occur in many countries. The group found no evidence that intakes as high as 1,500 mg. a day were undesirable. It, therefore, did not suggest alteration in the calcium intake of large groups of people whose dietary habits provide daily intakes of the order of 800 to 1,000 grams. No special recommendations were made for old age or for differences in physical activity.

A considerable proportion of the report dealt with recommendations for further research to provide additional information in this important area. Priority areas of research include basic studies of the histology, biochemistry, and physics of bones, collection and examination of bones from different areas of the world, thorough study of population groups consuming either very high or very low intakes of calcium, effects of different levels of intake on health in pregnancy and lactation, and the role of dietary calcium in the etiology and treatment of osteoporosis.

NUTS

The 1962 peanut crop in the United States, according to the U.S. Department of Agriculture, was estimated at 1,811 million pounds, 4% above the 1961 production of 1,743 million pounds. Major producing states (with 1962 estimated production in millions of pounds) were: Georgia, 545.2; North Carolina, 347.6; Texas, 224.7; Alabama, 196.9; Virginia, 239.2; and Oklahoma, 165.2.

Pecan production in 1962 was estimated at 69.3 million pounds, the smallest since 1936 and 71.1% lower than the 1961 output of 246.8 million pounds. Weather and pests were blamed for the small crop. Principal producing states (with 1962 estimated production in millions of pounds) were: Georgia, 15; Alabama, 6; Louisiana, 6; Texas 12; Mississippi, 8; New Mexico, 7.5; and Oklahoma, 7.

The almond yield in 1962 in California was estimated at 48,000 tons, 28% lower than the 1961 output of 66,400 tons.

English walnut production in 1962 was estimated at 81,400 tons, 21% higher than the 1961 crop of 67,500 tons. California produced 78,000 tons; Oregon, 3,400 tons.

Filbert production in 1962 was estimated at 7,900 tons, 33% lower than the 11,760 tons produced in 1961. Oregon accounted for 7,400 tons, and Washington for 500 tons.

The 1962 tung nut crop was estimated at 21,800 tons, only about 20% of the 1961 crop of 111,500 tons; a late freeze after the bloom was blamed for the poor production. Chief producing states were Mississippi, 11,000 tons; Florida, 8,000 tons; and Louisiana, 2,200 tons.

OCEANOGRAPHY

Among the outstanding developments in oceanography during 1962 were the establishment of a chain of current-measuring anchored buoys from the United States to Bermuda; the launching and field testing of an immense, floating instrument platform; the development of a new navigational system that may eventually measure the slope of the earth's surface; the successful carrying out of a substantial part of the International Indian Ocean Expedition; and the beginning of the second phase in drilling toward the Mohorovičić discontinuity layer (Project Mohole).

A new record ocean depth of 37,782 feet (7.2 miles) was reported on November 6 by the British survey ship *Cook* in the Mindanao Trench east of the Philippines in the Pacific; the previous record of 36,204 feet had been found in the Mariana Trench in the Pacific by Russian scientists in 1959.

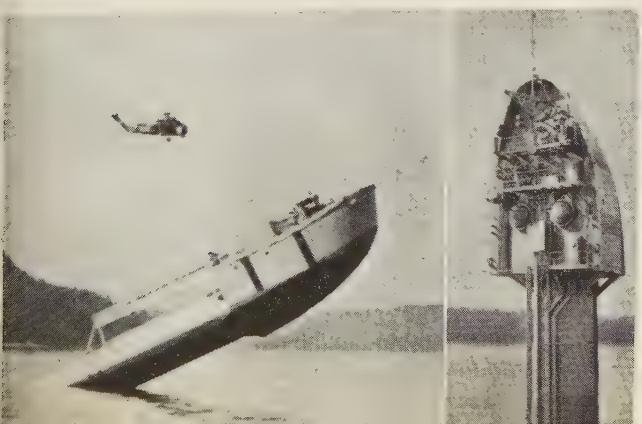
Current-Measurement Buoys.—William S. Richardson of the Woods Hole Oceanographic Institution has recently anchored a series of instrumented buoys from Gay Head on the island of Martha's Vineyard, Mass., to Bermuda across the Gulf Stream. The instruments are measuring continuously the speed and direction of the current, both at the sea surface and at depths below. This is the greatest array of current-measuring apparatus ever assembled. Since the measurements are continuous and the operation has already been carried out successfully for several months, it is expected that a great deal will be learned about the fluctuations in time and space of the Gulf Stream, already known to be one of the world's greatest currents.

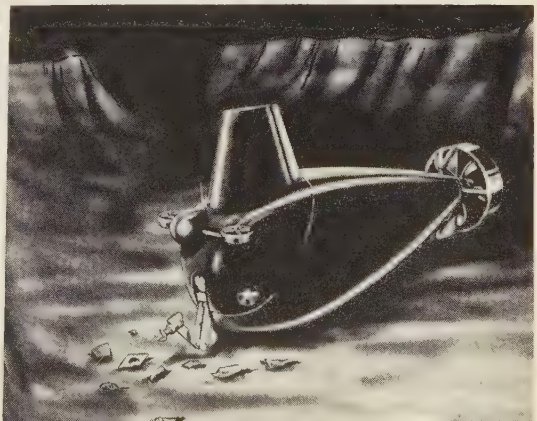
Floating Instrument Platform.—Built and launched in Portland, Oreg., a floating instrument platform (called FLIP) has undergone its first sea trials, and has been towed to San Diego, Calif., where the scientific equipment is being installed. The platform is 355 feet long and 12.5 feet wide at the water line, 20 feet wide at its bottom (300 feet below the surface), and weighs about 600 tons. A cabin 14.5 by 25 feet in area is mounted 30 feet above the water line. FLIP is designed to float horizontally while being towed to the working area, and then, when one end is flooded with sea water, to float vertically. Such an arrangement provides an extremely stable platform, with less than three feet of up and down movement for 30-foot ocean waves, and only a little more than one degree of roll. Its first use will be in measurements of underwater sound, but it will also provide an ideal platform for studies of both surface and internal waves and in marine biology. The instrument was designed and will be used by F. H. Fisher and F. N. Spiess, Marine Physical Laboratory of the Scripps Institution of Oceanography, University of California, San Diego.

Navigational Aid.—William S. von Arx of the Woods Hole Oceanographic Institution has reported (*Naval Research Review*, January 1962) the development of a gyro-erected optical navigation system (called Geon), that uses a meridian gyrocompass as a level reference plane instead of the present method of sighting from the horizon.

(*Left*) The 355-foot FLIP (floating instrument platform) was floated horizontally to this site in Dabob Bay, Wash., where it is "flipped" to a vertical position, July 25, providing a deep base for oceanographic study. (*Right*) To be completed in 1963, the U.S. Navy research vehicle in this sketch will have an undersea endurance of 24 hours and a range of 30 miles.

UPI; U.S. NAVY





It allows a ship's position to be determined from one sight of a celestial body during clear-sky conditions at any time of the day or night, with an accuracy of about one nautical mile.

A second possible use of a more refined Geon would be, in combination with the Transit satellite, to determine the regional slope of the earth. This would be done by using Geon to obtain the astronomical position on the earth's surface and Transit to fix the geocentric coordinates of the same point. With still greater refinement it may be possible to examine the circle of the horizon from ships at sea and establish with high precision the attitude of the horizon relative to the direction of local gravity.

International Indian Ocean Expedition.—By September 1962 about 275 ship-months of work on this project had been specifically planned or completed. About one fourth of this total was done before 1962, but the major effort started in mid-1962, according to Robert G. Snyder, coordinator of the expedition. The expedition is cooperative, planned by the International Council of Scientific Unions through the Special Committee on Oceanic Research. Participating countries are Australia, France, Germany, India, Indonesia, Japan, Pakistan, Portugal, South Africa, Thailand, the United Kingdom, the United States, and the USSR. United States participation in the various fields of oceanic research is being planned through the Woods Hole Oceanographic Institution, the Scripps Institution of Oceanography, the Lamont Geological Observatory, the Narragansett Laboratories of the University of Rhode Island, and the universities of Washington, Michigan, and Hawaii. The U.S. Weather Bureau will place meteorological equipment and personnel aboard the United States vessels. A coordinated meteorological program has been organized with a center in Bombay. Other participating agencies include the U.S. Coast Guard and the U.S. Air Force. Scientists from more than 100 colleges and universities will be involved in the research, which will include physical and chemical oceanography, geochemistry, geophysics, geology, meteorology, and biology.

Equatorial Undercurrent.—During the earlier part of the International Indian Ocean Expedition, in the winter of 1959–60, measurements on the 33d cruise of the Soviet research vessel *Vityaz* provided some evidence of a strong eastward-flowing subsurface current at the equator, analogous to the recently discovered Equatorial Undercurrent (Cromwell Current) of the Pacific and Atlantic oceans. Since the northeast monsoon prevails during the winter, the wind system is more nearly like that of the Atlantic and Pacific, and it might be supposed that such a flow would occur in the Indian Ocean also. However, in summer the southwest monsoon prevails, and there has been much speculation as to whether this current should exist in the Indian Ocean in summer. In July 1962 an expedition led by John A. Knauss aboard the United States research vessel *Argo* made careful observations along the equator in the Indian Ocean and found no eastward-flowing current.

Drilling Into the Ocean Floor.—The preliminary drilling in 1961 penetrated successfully through 600 feet of sediment below 11,700 feet of water off the coast of Baja (Lower) California. Preparations have begun for the second stage in drilling toward the Mohorovičić discontinuity, the level at which the marked increase in the velocity of transmission of sound waves indicates the transition from the earth's crust to its next great layer, the mantle. The second phase will probably be carried out near Puerto Rico, although alternative areas near Hawaii have been considered. The project is sponsored by the National Science Foundation (q.v.), which has contracted with construction firms for the drilling.

OHIO

A North Central state of the United States, Ohio ranks 35th among the states in area (land, 40,972 square miles; inland water, 250) and 6th in population (10,097,000 on July 1, 1962, a 4% increase from the 1960 census figure of 9,706,397). Urban places with populations above 25,000 in 1960:

Akron	290,351	Lorain	68,932
Alliance	28,362	Mansfield	47,325
Barberton	33,805	Maple Heights	31,667
Canton	113,631	Marion	37,079
Cincinnati	502,550	Massillon	31,236
Cleveland	876,050	Middletown	42,115
Cleveland Heights	61,813	Newark	41,790
Columbus (*capital*)	471,316	Norwood	34,580
Cuyahoga Falls	47,922	Parma	82,845
Dayton	262,332	Portsmouth	33,637
East Cleveland	37,991	Sandusky	31,989
Elyria	43,782	Shaker Heights	36,460
Euclid	62,998	South Euclid	27,569
Findlay	30,344	Springfield	82,723
Garfield Heights	38,455	Steubenville	32,495
Hamilton	72,354	Toledo	318,003
Kettering	54,462	Upper Arlington	28,486
Lakewood	66,154	Warren	59,648
Lancaster	29,916	Youngstown	166,689
Lima	51,037	Zanesville	39,077

Government.—Chief executive and judicial officers in 1962 included Michael V. DiSalle (Democrat), governor, serving a four-year term; John W. Donahey, lieutenant governor; Ted W. Brown, secretary of state; Joseph T. Ferguson, treasurer; James A. Rhodes, auditor; Mark McElroy, attorney general; Edward E. Holt, superintendent of public instruction; and Carl V. Weygandt, chief justice of the 7-member Supreme Court.

The Ohio General Assembly, which convenes in odd-numbered years, comprised 20 Republicans and 18 Democrats in the Senate in 1962 and 84 Republicans and 55 Democrats in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $1,690,292,226 included $950,143,678 from state taxes and $320,619,360 in federal funds. Chief tax yields were the 3% general sales tax ($264,878,026), motor fuel taxes ($231,325,106), and licensing ($168,938,698). Spending of $1,665,049,399 included $364,363,834 for education, $325,775,709 for health, welfare, and safety, and $334,640,079 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 44,611 teachers enrolled 1,340,653 pupils; secondary schools with 29,990 teachers enrolled 660,620; and parochial schools with 10,442 teachers enrolled 367,090. College enrollment totaled 188,016.

Estimated public school spending in the 1961–62 school year totaled $1,011,200,000, including current expenditures of $822 million ($443 per pupil) and capital outlays of $150 million. Revenue of $1,029,500,000 was drawn chiefly from state funds ($242 million) and local districts ($582 million). Teachers' salaries averaged $5,530 (high school, $5,845; elementary, $5,288). Actual spending for higher education amounted to $129,793,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 375,393 persons totaled $204,211,206. This amount included $84,434,755 for the aged and $48,709,646 for dependent children.

Transportation and Communications.—A total of 2,118 miles of state highway construction and reconstruction was completed in the 1962 fiscal year. *Highways and roads* on Jan. 1, 1962, totaled 104,525 miles (72,420 surfaced). These served 4,492,172 *motor vehicles* (as registered on March 31, 1962), including 3,712,280 automobiles. Operating in the state were (1960) 51 *railroads* (using 11,926 line miles of track); (1961) 11 regularly scheduled *airlines;* and 201 commercial and municipal *airports.*

Communications media included (1962) 93 AM and 62 FM *radio stations;* 11 VHF and 14 UHF *television stations;* 96 daily *newspapers* (circulation, 5,899,210) and

266 other newspapers (923,543); and (January 1) 1,064,900 business and 3,164,200 residential *telephones.*

Labor Force.—The civilian labor force in July 1962 totaled 3,962,900, including 203,600 agricultural workers. Nonagricultural wage and salary workers numbered 3,120,900, compared with 3,069,800 for the previous July and an average of 3,047,300 for the full year 1961. Chief sources of nonfarm employment in July 1962 were trade (610,200), government services (409,400), and service industries (386,600). Unemployment in July 1962 stood at 209,000, compared with 271,400 for the previous July.

Manufacturing.—Manufacturing engaged 1,179,700 workers in 1961, including 861,400 in production. During 1960, manufacturing employees numbered 1,265,640, of whom 911,593 were in production; total payroll was $7,473,451,000, and adjusted value added by manufacture amounted to $13,841,807,000.

LEADING OHIO MANUFACTURES, 1960

Industry group	Total employees[1]	Total payroll (in thousands)	Adjusted value added by mfr.[1] (in thousands)
Transportation equipment	166,236	$1,107,602	$2,144,049
Primary metals	171,526	1,078,306	2,003,014
Nonelectrical machinery	168,735	1,047,640	1,725,834
Electrical machinery	118,356	677,969	1,346,581
Fabricated metals	114,851	649,901	1,163,151
Food and kindred products	83,018	430,158	1,005,283
Chemicals and products	46,751	284,109	855,836
Rubber and plastics products	79,298	464,602	811,146
Stone, clay, glass products	66,004	347,942	746,218
Printing and publishing	62,972	361,424	619,550
Paper and products	37,348	213,176	405,294

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Ohio ranked 16th among the states in the value of its mineral output, with 2.03% of the national total. The 1961 value declined 6% due to a decrease in construction and reduced output of pig iron and steel. The state was first in production of clays and lime.

OHIO MINERAL PRODUCTION, 1961
(In short tons, except as noted)

Mineral	Quanity	Value
Cement:		
Portland (376 lb. bbl.)	15,303,000	$ 53,251,000
Masonry (280 lb. bbl.)	846,000	2,604,000
Clays	4,923,000	13,790,000
Coal	32,226,000	121,343,000
Coke	6,703,475	112,870,000[1]
Ferroalloys	544,441	134,694,000[1]
Iron, pig	11,007,351	669,033,000[1]
Lime	3,123,000	42,158,000
Natural gas (1,000 cu. ft.)	36,423,000	9,069,000
Petroleum (bbl.)	5,161,000[2]	15,947,000[2]
Salt, common	3,465,000	25,037,000
Sand and gravel	33,688,000	41,272,000
Stone[3]	33,652,000	55,701,000
Other minerals	...	1,693,000
Total	...	$368,315,000[1,4]

[1] Value for processed materials is not included in the total. [2] Preliminary. [3] Excludes certain stone, value of which is included in "Other minerals." [4] Total adjusted to avoid duplication of value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $725,303,000, compared with $739,839,000 for the corresponding period of 1961. For the full year 1961, income comprised $636,029,000 from livestock, $409,330,000 from crops, and $60,439,000 in government payments. Principal income sources in 1961 were wholesale milk, $216,860,000; cattle, $156,251,000; hogs, $151,735,000; and soybeans, $101,638,000.

The state's 140,000 farms in 1959 had an acreage of 18,507,000 (9,743,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 2,249,000 cattle, 2,651,000 hogs, 977,000 sheep, and 13,147,000 chickens. An average of 206,000 family and 36,000 hired workers engaged in farming in 1961.

WIDE WORLD

Shown here with her court, Jacquelyn Jeanne Mayer, 20, of Sandusky, Ohio, is elected Miss America 1963, September 8.

OHIO CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	3,205	3,500	3,700
Corn for grain (1,000 bu.)	194,223	187,738	202,388
Grapes (tons)	14,690	16,500	17,000
Hay (1,000 tons)	3,803	3,829	3,142
Maple sirup (1,000 gal.)	121	99	114
Oats (1,000 bu.)	50,776	36,850	48,314
Peaches (1,000 bu.)	956	950	700
Soybeans (1,000 bu.)	29,373	48,216	46,104
Tobacco (1,000 lb.)	22,958	22,806	25,115
Tomatoes (1,000 cwt.)	509	403	360
Wheat (1,000 bu.)	44,367	45,167	38,688

(Source: U.S. Department of Agriculture.)

Events, 1962.—Democratic Gov. Michael V. DiSalle, seeking reelection to a second term, was defeated by State Auditor James A. Rhodes in the November 6 elections. The victor's plurality was a record-breaking 555,669 votes. Democratic Sen. Frank J. Lausche weathered the Republican landslide, however, with an easy victory (by 692,640 votes) over John M. Briley of Toledo, who had been chairman of the Ohio Republican Finance Committee.

The contest for the governorship was extremely personal, and involved charges against the conduct of the state liquor department and the attorney general's office. Rhodes proposed an industrial development program, supposedly without increased taxation. DiSalle had gained the nomination after one of the most bitter primary fights in Ohio history. His opponent, Cleveland attorney Mark McElroy, waged an intensive campaign and succeeded in carrying 21 counties in the May 8 primary.

In November, Ohio Republicans increased their representation in Congress from 16 to 18. Robert A. Taft, Jr., a fourth-generation representative of the Cincinnati Republican family, easily won the congressman-at-large seat. After an interval of six years (for reasons of health) Oliver P. Bolton was returned to Congress, as was his mother, Frances P. Bolton; the two represent adjoining districts in northern Ohio.

Republicans also maintained control of the General Assembly (by 88 to 49 in the House, and 20 to 13 in the Senate). Carl V. Weygandt, 74, chief justice of the Ohio Supreme Court since 1933, lost by a narrow margin to Justice Kingsley Taft. A proposed constitutional amendment advocated by a large dairy products store chain, would

have specifically exempted certain items from coverage under the state's "blue laws." The plan was rejected by the voters, leading immediately to stricter observance of Sunday closing regulations.

During the year Senator Lausche strongly criticized the awarding of federal defense contracts to coastal states to the neglect of Ohio's interests, and demands were made for changing the situation. Cincinnatians took a major step toward rehabilitation of the blighted waterfront district by approving a $16.6 million bond issue.

In late February and early March, flood conditions resulted in property losses, particularly in the Scioto and Sandusky valleys. Drought during the summer caused Governor DiSalle to designate 21 counties as drought disaster areas.

In February, Lt. Col. John H. Glenn, Jr., of New Concord became the first American to orbit the earth (see SPACE FLIGHT). He was accorded a hero's reception in his hometown on March 3. In the sports world, golfer Jack Nicklaus of Columbus, making his first professional tour, won the National Open championship in June and the "World Series of Golf" in September (see also SPORTS, GAMES, AND SHOWS).

A new branch of the Ohio State University was opened in September in Lakewood, a suburb of Cleveland.

OKLAHOMA

A Southwestern state of the United States, Oklahoma ranks 18th among the states in area (land, 68,887 square miles; inland water, 1,032) and 26th in population (2,448,000 on July 1, 1962, a 5.2% increase from the 1960 census figure of 2,328,284). Urban places with populations above 15,000 in 1960:

Altus	21,225	Muskogee	38,059
Ardmore	20,184	Norman	33,412
Bartlesville	27,893	Oklahoma City (*capital*)	324,253
Duncan	20,009	Okmulgee	15,951
Enid	38,859	Ponca City	24,411
Lawton	61,697	Shawnee	24,326
McAlester	17,419	Stillwater	23,965
Midwest City	36,058	Tulsa	261,685

Government.—Chief executive and judicial officers in 1962 included J. Howard Edmondson (Democrat), governor, serving a four-year term; George Nigh, lieutenant governor; William N. Christian, secretary of state; William A. Burkhart, treasurer; Imogene Holmes, auditor; Mac Q. Williamson, attorney general; Oliver Hodge, superintendent of public instruction; and Ben T. Williams, chief justice of the 9-member Supreme Court.

The Oklahoma Legislature, which convenes in odd-numbered years, comprised 40 Democrats and 4 Republicans in the Senate in 1962 and 105 Democrats and 14 Republicans in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $542,894,028 included $382,885,849 from state sources and $160,008,179 in federal funds. Chief tax yields were the 2% general sales tax ($57,013,809) and taxes on individual incomes ($39,049,495) and motor fuels ($68,687,025). Spending of $496,934,041 included $146,320,949 for education, $201,232,031 for health, welfare, and safety, and $117,914,686 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 12,155 teachers enrolled 335,500 pupils; secondary schools with 9,200 teachers enrolled 214,500; and parochial schools with 691 teachers enrolled 17,469. College enrollment totaled 59,623 in 33 institutions, including 15 junior colleges and 18 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $204,550,000, including current expenditures of $167,650,000 ($335 per pupil) and capital outlays of $33,000,000. Revenue of $213.5 million was drawn chiefly from state funds ($81 million) and local districts ($98 million). Teachers' salaries averaged $4,950 (high school, $4,980; elementary, $4,930). Actual spending for higher education (1961 fiscal year) totaled $54,620,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 165,598 persons totaled $110,382,686. This amount included $71,285,564 for the aged and $26,275,250 for dependent children.

Transportation and Communications.—A total of 697 miles of highway construction and reconstruction was completed in the 1962 fiscal year. *Highways, roads, and streets* on Jan. 1, 1962, totaled 103,973 miles (20,570 surfaced). These served 1,232,083 *motor vehicles* (as registered in 1961), including 900,124 automobiles. Operating in the state in 1962 were 20 *railroads* (using 5,984 line miles of track); 5 regularly scheduled *airlines;* and (1961) 133 commercial and municipal *airports* and 4 heliports.

Communications media included (1961) 56 AM and 13 FM *radio stations;* 10 VHF *television stations;* 59 daily *newspapers* (circulation, 1,705,730) and 215 other newspapers (348,056); and (Jan. 1, 1962) 271,900 business and 670,500 residential *telephones.*

Labor Force.—The state's labor force in July 1962 included 155,000 agricultural workers. Nonagricultural employment totaled 594,000, compared with 586,700 a year earlier and an average of 583,400 for 1961. Of nonfarm wage and salary workers, 23.3% were in trade, 22.7% in government services, and 15% in manufacturing. Unemployment in July 1962 numbered 44,200, compared with 55,100 a year earlier.

Manufacturing.—Covered manufacturing engaged 83,222 workers in 1961 and provided a payroll of $412,373,614. In 1960, workers averaged 93,139, including 58,841 in production. They received $471,191,000 in wages and added $803,493,000 in adjusted value by manufacture.

LEADING OKLAHOMA MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted value added by mfr.[1]
Petroleum and coal products	6,025	$35,830	$138,182
Food and kindred products	14,913	61,654	133,077
Nonelectrical machinery	9,945	50,540	88,448
Fabricated metals	8,819	45,773	83,884
Stone, clay, glass products	6,442	31,002	71,216

Mining.—In 1961, Oklahoma ranked fifth among the states in the value of its mineral output, with 4.34% of the national total. Mineral fuels provided 93% of the total value. The state was first in output of helium, second in tripoli, third in natural gas and natural gas liquids, and fourth in petroleum.

OKLAHOMA MINERAL PRODUCTION, 1961
(In short tons except as noted)

Mineral	Quantity	Value
Clays[1]	792,000	$ 801,000
Coal	1,032,000	6,784,000
Helium (1,000 cu. ft.)	313,244	5,872,000
Lead (recoverable content of ores)	980	202,000
Natural gas (1,000 cu. ft.)	892,697,000	108,016,000
Natural gasoline (1,000 gal.)	521,237	33,358,000
Petroleum (1,000 bbl.)	191,834[2]	558,237,000[2]
Petroleum gases (1,000 gal.)	817,082	30,141,000
Sand and gravel	5,310,000	5,513,000
Stone	14,981,000	16,561,000
Zinc (recoverable content of ores)	3,148	724,000
Other minerals	...	21,920,000
Total	...	$785,973,000[3]

[1] Excludes certain clays, value of which is included in "Other minerals." [2] Preliminary. [3] Total adjusted to avoid duplication in the value of clays and stone. (Source: U.S. Bureau of Mines.)

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $463,998,000, compared with $488,755,000 for the corresponding period of 1961. For the full year 1961, income comprised $366,056,000 from livestock, $313,859,000 from

crops, and $36,732,000 in government payments. Principal income sources in 1961 were cattle, $260,683,000; wheat, $177,253,000; cotton lint, $52,861,000; and wholesale milk, $52,664,000.

The state's 95,000 farms in 1959 had an acreage of 35,801,000 (8,975,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 3,654,000 cattle, 428,000 hogs, and 3,481,000 chickens. An average of 129,000 family and 36,000 hired workers engaged in farming in 1961.

OKLAHOMA CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Barley (1,000 bu.)	6,677	19,250	9,026
Broomcorn (tons)	11,490	6,600	7,000
Cotton lint (1,000 bales)	360	369	330
Cottonseed (1,000 tons)	147	153	137
Hay (1,000 tons)	1,793	2,169	2,282
Mung beans (1,000 lb.)	5,440	7,370	8,160
Peanuts (1,000 lb.)	100,348	146,625	165,200
Pecans (1,000 lb.)	20,640	11,600	7,000
Rye (1,000 bu.)	768	792	522
Sorghum grain (1,000 bu.)	13,627	16,866	19,740
Soybeans (1,000 bu.)	891	3,062	2,822
Wheat (1,000 bu.)	75,225	110,832	71,953

(Source: U.S. Department of Agriculture.)

Events, 1962.—One of the more notable political events in Oklahoma history occurred on November 6 when Henry Bellmon, Noble County farmer, became the first member of the Republican Party to be elected governor. He defeated W. P. (Bill) Atkinson, Midwest City Democrat, by 392,316 to 315,357. Bellmon's campaign promises to break the Democratic "strangle hold" on the state government and to seek no tax increases proved more popular with the voters than Atkinson's insistence that additional tax burdens appeared necessary. Democrats were, as usual, elected to other state offices.

Democrat Mike Monroney was returned to the U.S. Senate for a third term with a victory (by about 44,000 votes) over B. Hayden Crawford. The five Democrats and one Republican in the U.S. House of Representatives were all reelected.

Oklahoma's veteran U.S. Sen. Robert S. Kerr, one of the most influential figures in Congress, died on Jan. 1, 1963. To fill the vacancy, Democratic Gov. J. Howard Edmondson, 37, resigned on January 6 (just eight days before he was to be succeeded by the Republican governor-elect) in favor of Lt. Gov. George Nigh, who immediately appointed Edmondson to the Senate seat. A special election will be held in 1964 for the remaining two years of the term.

Reapportionment of the Oklahoma Legislature on a population basis must be accomplished before election of the 1965 membership, but the determination of the agency of government which will make the apportionment was not clear. By a three-judge federal court decision on August 3, the Legislature which convenes in January 1963 was given until March 8 to reapportion; otherwise this would be accomplished by judicial order. Notwithstanding this ruling, voters in November expressed approval of a measure which takes the apportionment decision away from the Legislature and places it in a committee composed of the secretary of state, state treasurer, and attorney general. By whatever agency, reapportionment was expected to minimize rural domination of the Legislature and give metropolitan centers a sizable increase in representation.

Construction began May 10 on Oklahoma's Southwest Turnpike, an 86-mile, 4-lane divided highway. The turnpike consists of two sections, the northern part extending 61 miles from the southwestern edge of Oklahoma City to Lawton, and the southern part running 25 miles from Lawton to U.S. Highway 70. Target date for completion of the $57 million project is June 1, 1964. The State of Texas will spend $2.5 million in the Wichita Falls area to connect its Red River Valley Expressway with the improved road.

Under a Ford Foundation grant announced in October, Oklahoma City University will receive $2 million within the next three years if it can raise $4 million from other sources. Another grant, of $1,250,000, was made to the Mummers Theatre of Oklahoma City. This provides $700,000 to help finance a permanent building if $750,000 can be raised locally. On assurance of the building the foundation will provide $550,000 to help underwrite artistic, administrative, and technical development over a 10-year period.

Tulsa voters on July 17 approved an $18.9 million water, sewer, and fire protection bond issue, the largest amount authorized in 40 years. In October 1961, citizens of Oklahoma City had approved a $39.8 million bond issue, and on November 27 an additional $47.4 million. This sum will be spent in three years to modernize the city—improve park and zoo facilities, streets, and traffic control, and provide a new passenger terminal for Will Rogers Field.

Oklahoma on November 6 elected its first Republican governor, Henry Bellmon of Billings. Democrats won all the other state offices.

WIDE WORLD

The state took pride in its 19 national winners at the 4-H Club Congress, held at Chicago in November. This achievement broke the old record of 16 national winners for one state—set by Oklahoma in 1961.

"Events" by: J. Stanley Clark,
Author of "The Oil Century from the Drake Well to the Conservation Era."

OLD AGE

No issue related to older people in the United States aroused so much debate throughout the nation, as well as in Congress, during 1962 as the proposal to finance hospitalization and nursing services for older people out of Social Security funds.

In 1961 a bill to enact such a program (popularly known as the "Medicare plan") was introduced by Sen. Clinton P. Anderson (D, N. Mex.) and Rep. Cecil R. King (D, Calif.). Public hearings were held on this bill by the House Ways and Means Committee, but the bill never reached the floor of the House. President Kennedy, in two messages to Congress early in 1962, again requested that health insurance protection for the aged be made a part of the Social Security system. When the bill seemed stalled in committee, Senator Anderson, along with 20 other Democratic and 5 Republican senators, proposed an amendment to H.R. 10606 (the public welfare bill) and thus secured floor debate on his proposal. Despite the fact that Senator Anderson had incorporated numerous revisions in the 1962 version of his bill

PLETCHER IN THE SIOUX CITY JOURNAL

"YOUR REFLEXES ARE VERY, VERY SLOW"

in order to attract broader support, the Senate on July 17, 1962, after two weeks' debate, voted 52 to 48 to table the Anderson amendment.

Other proposals introduced in Congress in 1962 sought to obtain federal financial support for health protection for aged persons outside the Social Security system. Sen. Thruston Morton's (R, Ky.) amendment would have reimbursed states for premium payments on behalf of older persons in a bona fide health insurance program. Sens. Leverett Saltonstall (R, Mass.) and Jacob K. Javits (R, N.Y.) proposed federal matching grants-in-aid to states that created an approved state plan of health protection for aged persons. An amendment by Sen. Prescott Bush (R, Conn.) would have permitted the Social Security system to reimburse beneficiaries of federal Old-Age, Survivors, and Disability Insurance (OASDI) for premiums paid by them to voluntary health-insurance programs.

Under the present system of health protection for older persons, states receive grants-in-aid from the federal government for the costs of hospital and medical care provided to persons 65 or over who can not pay for the care needed out of their own resources. The King-Anderson bill and other proposals were designed to establish or encourage a system by which health care would be received as a right rather than on the basis of need.

Welfare Legislation.—While public attention was focused on congressional action on the King-Anderson bill, other legislation of considerable importance to older people was enacted as part of the public welfare bill passed July 19, 1962. Old-age assistance grants were increased by $4 per month; and, to encourage self-support, the first $10 and half of the next $50 earned by old-age assistance recipients were excluded from consideration of need. Other amendments encouraged a greater degree of independence and self-help among the dependent aged. Of administrative importance was an amendment which permitted states to place programs of assistance to the aged, the disabled, and the blind under a single administrative unit.

Income of Older People.—Figures for 1961 income received by persons over 65, compiled by the Social Security Administration, re-emphasize the low economic status of older people in the United States. In fact, their economic position has deteriorated because fewer men over 65 are employed. Only 5.3% of all persons over 65 receive their sole support from earnings derived from employment. About 87% receive some form of public benefit either as their sole source of income or as a supplement to wages and salaries. The remaining 7% live on private savings, are in institutions, or are supported by relatives and friends.

Incomes of families of which the head is over 65 years of age are only half as large as those of families of similar size in which the head is below age 65. The disparity in income between single persons above and below the age of 65 is even greater. The over-65 families had a median income of $2,900 in 1961, but the under-65 families received $5,905. About 31% of all over-65 families received less than $2,000 per year, compared with 10.2% for all under-65 families. (See also CENSUS DATA.)

In June 1961, 12,430,000 persons (72.6% of all persons over 65) received benefits from OASDI, and 7,950,000 (46.4% of all older people) were dependent solely on this source for their livelihood. Although 2,400,000 persons (14% of all persons 65 and over) received public assistance, only 1,510,000 (8.5%) were dependent solely on old-age assistance. Despite the increasing numbers of older people in the population, the total number receiving old-age assistance has remained constant for the past several years. The number, as well as the percentage, of those totally dependent solely on such assistance has declined substantially, however, as a result of the wider coverage and the higher benefits being received by OASDI beneficiaries. In August 1962 the average OASDI benefit to retired workers was $76.15 per month. With a 50% benefit for a dependent wife, the average family benefit would be $114.25. Under the old-age assistance program, the average monthly payment was $73.04.

Programs for the Aging.—The two most important organizations working in the field of the aging are the National Council on Aging (NCOA), located in New York City, and the Division of Gerontology of the Institute for Human Adjustment, University of Michigan. At the annual meeting of the NCOA, in New York City, Oct. 24–27, 1962, a featured discussion subject was "The Older Worker on the Job and in Retirement." Given a prominent place in the discussions were such subjects as automation, union organization, training and retraining, early retirement, and preparation for retirement. The theme of the annual conference of the Division of Gerontology, held at the University of Michigan in June 1962, was the political implications of aging. Plans were made for the Quadrennial International Conference of Gerontology in Copenhagen, Denmark, on Aug. 5–15, 1963.

ONTARIO

The second largest province in Canada, Ontario stretches 1,050 miles from Hudson Bay in the north to Lake Erie in the south, and extends for 1,000 miles from east to west. Its area of 412,582 square miles comprises 10.7% of the total area of Canada. It is the most heavily populated province, with an estimated population of 6,342,000 on June

1, 1962 (1961 census, 6,236,092). About 75% of the population is urban, and 90% is English-speaking. The largest cities are Toronto, the provincial capital, with 672,407 inhabitants in the 1961 census (metropolitan area, 1,618,787); Hamilton, 273,991; Ottawa, the capital of Canada, 268,206; London, 169,569; Windsor, 114,367; and St. Catharines, 84,472.

Government.—The premier of Ontario (since 1961) is John P. Robarts, leader of the provincial Progressive Conservative Party. The head of government is the lieutenant-governor (John Keiller MacKay since 1957), appointed by the federal government. There is no upper house, and the elected Legislative Assembly of 98 members was composed in September 1962 of 67 Progressive Conservatives, 23 Liberals, and 5 New Democratic Party (formerly Co-operative Commonwealth Federation) members; 3 seats were vacant. In the Canadian Parliament, the province is represented by 85 members in the House of Commons and 24 in the Senate.

Education.—Thirteen years of free education are provided by the province and municipalities. Enrollment in 1961–62 was 1,462,000, an increase of 73,000. In 1962–63 financial assistance from the province will be raised $26.9 million to $208 million, and government assistance to the 11 universities will total $45.5 million. University enrollment in September 1962 was approximately 35,000, with nearly half attending the University of Toronto. Plans are under way for the establishment of a new university at Peterborough by 1964.

Finance.—Net ordinary revenue for the fiscal year ending March 31, 1962, was $813,691,000, and net ordinary expenditure was $813,259,000. At that date the net capital debt stood at $1,240,729,219. Major sources of revenue were: corporation taxes, $166 million; gasoline taxes, $164 million; and income tax rental agreements with the federal government, $121 million. The new sales tax, in force only part of the year, provided $76 million. Major governmental expenditures were: education, $269 million; health and welfare, $132 million; and highways, $72 million.

Transportation and Communications.—Motor vehicle registration as of March 1962 was 2,123,286. In 1961–62 (to March), 473 miles of highways were added to the 85,830 in the province. Ontario has 10,500 miles of railways. In 1960 there were 2,300,000 telephones.

Provincial Economy.—The total labor force in 1961 was 2,393,000, and the number employed averaged 2,261,000. The average personal per capita income was $1,855, the highest in Canada. Consumer spending in retail trade reached $6,337 million.

Energy.—In 1961 a record electric power volume of nearly 38 billion kw.-hr. was generated, nearly 90% of which came from the publicly owned Hydro-Electric Power Commission of Ontario. The commission has increased its dependable peak capacity to more than 6.7 million kilowatts. Natural gas sales of 125,142,098 Mcf. were 20% higher than in 1960. Oil production totaled 1,147,682 barrels, the highest figure in over 100 years of records.

Agriculture and Forestry.—With a farm labor force of 172,000, farm cash income for 1961 was a record $895 million. Tobacco production was valued at about $104 million, down 5% from 1960. The value of fruits and vegetables was estimated at $100 million. Pulp and paper output in 1960 amounted to $494 million.

Minerals.—The province ranks first in mineral production, which in 1961 was valued at $948 million (the decline of $35 million from 1960 was more than accounted for by the fall in uranium output). Other minerals showed a gain of 2.6%, with substantial increases being made in iron ore, nickel, and zinc. Nickel output was $301 million; copper, $122.5 million; gold, $92 million; and iron, a record $55 million.

Manufacturing.—Ontario is the most important industrial area in Canada, accounting for over half the country's industrial output. The gross value of production in 1961 was $11,750 million. Ontario accounts for nearly all of Canada's motor vehicle output (99%), heavy electrical machinery (79%), rubber products (82%), and agricultural implements (91%).

Events, 1962.—A revised curriculum (the Robarts Plan) was inaugurated in Ontario's secondary schools in September. The new system offers both 5- and 4-year programs in arts, trades, and business, as well as a 2-year plan for students who intend to leave school early.

The $33 million nuclear power demonstration station at Rolphton was placed in operation in June. The plant, whose full power output is 20,000 kw., provides the Ontario Hydro with Canada's first nuclear-produced electricity. Work proceeded on a 460,000-volt transmission line from the area around James Bay in the north to the southern part of the province. The first large-scale high-voltage system in North America, the 550-mile line is scheduled for completion in 1963.

OPHTHALMOLOGY

The spectacular discovery of the year 1962 in ophthalmology was the middle limiting membrane of the retina, found by Fine and Zimmerman with the electron microscope. For decades only the external and internal limiting membrane have been known. The middle limiting membrane lies as a synapse between visual cells and second-order neurons, and forms the boundary of the innermost part of the outer plexiform layer. Cystic formations in the outer plexiform layer are delineated by it, as are also discrete rounded hemorrhages and exudates. Now that it has been described the middle limiting membrane can be recognized under ordinary high-power magnification.

Electromyography.—An entirely new and important approach to the neurophysiology and physiopathology of the extraocular muscles is given by the method of electromyography. The registration and analysis of the electric action potentials within the eye muscles affords an insight into the innervational factor of normal eye activity, and represents a tool for analysis of the altered or impaired ocular motility on the clinical level. In neurogenic paresis or palsies, the electromyogram manifests outfall of electrical activity. In ocular myopathies there is a striking contrast between the abundant discharge of action potentials and the paresis or paralysis of the affected eye muscles. The possibility of differentiation of motor-neuron, and myopathic-ocular-motility disorders is very important. All these insights into the electric behavior of extraocular muscles under normal and pathological conditions facilitate the understanding of underlying fundamental brain processes.

Conjunctivitis.—Adenoviruses are variously transmitted and gain entry through the oropharynx or conjunctiva. Several distinct syndromes have now been identified. Some respiratory illness predominates and involves the eye. The initial and subsequent isolations of Type 8 adenovirus from epidemic keratoconjunctivitis have been followed by epidemiological and experimental studies that established the etiological role of this agent. The existence in the Far East of infantile epidemic keratoconjunctivitis, a systemic syndrome with respiratory symptoms and follicular conjunctivitis but no keratitis, is now confirmed. It appears that this is the reservoir of infection from which arise

explosive epidemics in adults. Conjunctivitis and keratoconjunctivitis due to adenovirus types 3, 4, 7, 8, and 11 have been observed, and the clinical features of these are compared with particular reference to the corneal complications. Acute dacryoadenitis has occurred in association with adenovirus infection. The differential diagnosis of adenovirus infection and the role of the various laboratory investigations have been broadened.

New Drug Treatment.—The virus of herpes simplex depends for reproduction on the synthesis of its deoxyribonucleic acid in host cells. Substances which interfere with this synthesis will therefore interfere with the further development of the virus. But these antimetabolites will also interfere with or inhibit the vital functions in the normal cells, and if given systemically may be toxic. With dendritic keratitis, however, the compound is applied topically to a tissue in which the infected cells are superficial and are rapidly replaced, even if damaged by a compound toxic to both cells and virus. Cells which metabolize at a rate slower than the virus, metabolize less of the antimetabolite than the rapidly producing virus and thus are not inhibited to the same degree as the virus. This has led to the establishment of IDU or 5-iodo-2-deoxyuridine (Stoxil) as a spectacular new treatment for herpes simplex, dendritic keratitis, and related viral conditions. (See also CHEMOTHERAPY.)

Instruments for the Blind.—In the aid of the blind, scientists have begun to substitute auditory or tactile senses for sight. They have improved obstacle detectors by replacing the tapping cane with an electronic beam. Many of the instruments demonstrated have been designed to render the blind mobile. An electronic cane can warn of an obstacle by a sound made audible through an earphone, or alert the user by a vibrating handle. It is a sensitive enough device to inform a blind person of any step down greater than two inches. Light is converted into tactile stimuli by an optical camera worn on the head. It forms a plastic image of an object on the skin of a blind person very much as it is formed on the cerebral cortex, converting points of light into electrical stimuli. Another navigational aid involves a magnetic bar compass. A narrow beam of light is reflected by a mirror within the instrument and amplified, causing a peg to protrude from the top of the unit.

Eye Protection in Space.—As man moves out further into space he will have to protect his eyes from the effects of corpuscular radiation. Without such protection, deterioration of the optic nerve, retina, and extraocular muscles may be expected. Although a short period of weightlessness has no deleterious effect on the eyes, we are not certain about the effects of a prolonged period, or whether any harmful influences can be counteracted.

OREGON

A Northwestern coastal state of the United States, Oregon ranks 10th among the states in area (land, 96,248 square miles; inland water, 733) and 31st in population (1,864,000 on July 1, 1962, a 5.4% increase from the 1960 census figure of 1,768,687). Urban places with populations above 10,000 in 1960:

Albany	12,926	Klamath Falls	16,949
Altamont (uninc.)	10,311	Medford	24,425
Astoria	11,239	Pendleton	14,434
Bend	11,936	Portland	372,676
Corvallis	20,669	Roseburg	11,467
Dalles	10,493	Salem (*capital*)	49,142
Eugene	50,977	Salem Heights (uninc.)	10,770
Grants Pass	10,118	Springfield	19,616

Government.—Chief executive and judicial officers in 1962 included Mark O. Hatfield (Republican), governor, serving a four-year term; Howell Appling, Jr., secretary of state; Howard C. Belton, treasurer; Robert Y. Thornton, attorney general; Leon P. Minear, superintendent of public instruction; and William M. McAllister, chief justice of the 7-member Supreme Court.

The Oregon Legislative Assembly, which convenes in odd-numbered years, comprised 20 Democrats and 10 Republicans in the Senate in 1962 and 31 Democrats and 29 Republicans in the House of Representatives.

Finance.—In the 1962 fiscal year, revenue of $757,785,483 included $202,338,181 from state taxes and $94,802,145 in federal funds. Chief tax yields were from individual incomes ($110,500,000), motor fuels ($38,512,416), and licensing ($43,695,805). Spending of $774,363,697 included $111,751,709 for highways.

Education.—In the 1961–62 school year it was estimated that public elementary schools staffed by 11,642 teachers enrolled 299,727 pupils; secondary schools with 5,000 teachers enrolled 112,469; and parochial schools with 957 teachers enrolled 28,863. College enrollment totaled 47,786 in 23 institutions, including 4 junior colleges and 19 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $206,629,000, including current expenditures of $174,579,000 ($477 per pupil) and capital outlays of $28 million. Revenue of $215.2 million was drawn chiefly from state funds ($62.4 million) and local districts ($130 million). Teachers' salaries averaged $5,775 (high school, $6,050; elementary, $5,650). Actual spending for higher education (1961 fiscal year) totaled $55,419,000.

Public Assistance.—In the 1962 fiscal year public assistance expenditures to a monthly average of 64,000 persons totaled $42,579,471. This amount included $16,214,006 for the aged and $14,120,595 for dependent children.

Transportation and Communications.—With 355 miles of highway construction and reconstruction completed in 1961, *highways and roads* on Dec. 31, 1961, totaled 74,898 miles (45,394 surfaced). These served 996,502 *motor vehicles* (as registered on Dec. 31, 1961), including 859,014 automobiles. Operating in the state in 1962 were 18 *railroads* (using 3,541 line miles of track); 9 regularly scheduled *airlines;* and 120 commercial and municipal *airports* and airfields.

Communications media included (1962) 81 AM and 15 FM *radio stations;* 13 VHF *television stations;* (1961) 24 daily *newspapers* (circulation, 646,272); and (Jan. 1, 1962) 214,100 business and 544,200 residential *telephones.*

Labor Force.—During 1961 nonagricultural employment in the state averaged 506,100, compared with an average of 509,200 for 1960. Of nonfarm employees, 27.4% were in manufacturing, 21.9% in trade, and 18.7% in service industries. Unemployment in December 1961 stood at 27,700, as against 37,200 for December of the previous year.

Manufacturing.—Manufacturing engaged an average of 139,031 persons in 1961 and provided a payroll of $763,245,608. In 1960 manufacturing employed 142,887 workers, including 117,389 in production, and provided a payroll of $738,947,000. Adjusted value added by manufacture totaled $1,345,407,000.

LEADING OREGON MANUFACTURES, 1960

Industry group	Total employees	Total payroll (in thousands)	Adjusted [1] value added by mfr.[1] (in thousands)
Lumber and wood products	71,084	$357,743	$569,939
Food and kindred products	19,885	91,197	204,178
Paper and products	7,162	42,086	114,938
Primary metals	4,943	30,529	79,928
Printing and publishing	4,895	28,800	54,099
Fabricated metals	4,831	29,398	50,830
Transportation equipment	4,623	30,375	43,410
Stone, clay, glass products	2,891	15,179	29,681
Chemicals and products	1,596	8,945	25,103

[1] For definition, see footnote 1 in the article *Industrial Production.* (Source: *1960 Annual Survey of Manufactures.*)

Mining.—In 1961, Oregon ranked 38th among the states in the value of its mineral output ($54,922,000), with 0.30% of the national total. It was first in output of nickel and fourth in diatomite. Employment in the mineral industries decreased 4% during the year. In primary metals, one of the fastest growing industries in the 1950's, the employment decline was the first since 1954. Leading minerals were stone (valued at $20,939,000) and sand and gravel ($13,680,000).

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $295,778,000, compared with $292,683,000 for the corresponding period of 1961. For the full year 1961, income comprised $194,577,000 from livestock, $218,194,000 from crops, and $10,361,000 in government payments. Principal income sources in 1961 were cattle, $86,877,000; wholesale milk, $41,296,000; and wheat, $40,790,000.

The state's 43,000 farms in 1959 had an acreage of 21,236,000 (3,118,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,435,000 cattle, 851,000 sheep, and 3,108,000 chickens, and (1961) 11,619,000 commercial broilers. An average of 68,000 family and 27,000 hired workers engaged in farming in 1961.

OREGON CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	2,151	1,700	2,000
Barley (1,000 bu.)	16,898	16,698	16,856
Cherries (tons)	24,630	30,800	40,200
Cranberries (bbl.)	32,490	445,400	28,000
Filberts (tons)	7,660	11,100	7,400
Hay (1,000 tons)	1,855	1,914	1,927
Mint for oil (1,000 lb.)	750	964	990
Onions (1,000 cwt.)	2,030	2,094	2,276
Peaches (1,000 bu.)	420	430	470
Pears (1,000 bu.)	5,175	4,830	6,150
Potatoes (1,000 cwt.)	8,233	9,735	9,230
Prunes (tons)	40,910	28,000	47,000
Strawberries (1,000 lb.)	68,562	67,680	85,250
Walnuts (tons)	5,680	6,300	3,400
Wheat (1,000 bu.)	28,016	20,602	26,280

(Source: U.S. Department of Agriculture.)

Events, 1962.—The year 1962 will long be remembered for its violent Columbus Day "extratropical cyclone," a remnant of typhoon Frieda, the most destructive storm in the history of the Pacific Northwest. Thirty-two Oregonians lost their lives, and damage amounted to more than $170 million. More than 3 million board feet of timber were blown down; of the crop trees, walnuts, filberts, cherries, and prunes suffered the most damage.

On the political scene, two top office-holders retained their seats in the 1962 elections. Democratic U.S. Sen. Wayne L. Morse won reelection for a fourth term, defeating Sigfrid B. (Sig) Unander, former Republican state treasurer. Republican Gov. Mark O. Hatfield won by a large margin over Democratic Attorney General Robert Y. Thornton and Robert Wampler, a Clackamas County deputy sheriff running as an independent. Many observers felt that Hatfield's victory—by a 77,000-plus majority in the face of a Democratic registration advantage of more than 78,000—enhanced his position as a potential Republican vice presidential nominee in 1964.

Democrats took over the 4th Congressional District where the contest was between two members of the state legislature, Speaker of the House Robert B. Duncan, Democrat of Medford, and Rep. Carl Fisher, Republican of Eugene. One lone Republican, Rep. Walter Norblad of Stayton, remained in Congress. Voters finally approved daylight saving time, ending the confusion of the two

WIDE WORLD

High winds in the Pacific Northwest, October 11–13, topple a steeple at the College of Education at Monmouth, Oreg.

preceding summers, and approved a pay increase for legislators, even giving them the right to set their own salaries.

For the second year in succession, Oregon's construction industry was idle for a major part of the summer. A strike of ironworkers, which began on May 28, finally ended on July 21 with a three-year contract providing for a 71-cents-an-hour increase in wages and benefits. This was the longest strike ever to cripple the industry, and delayed completion of much-needed public buildings, especially schools.

The Northwest's lumber industry continued to be troubled by competition from British Columbia, but by year's end prospects appeared somewhat brighter for the future.

Oregon's tourist business registered an increase of 16%, and spending by visitors was estimated to have reached a new high of $217 million. The Seattle World's Fair undoubtedly accounted for much of the upswing. State parks were used by a record 11.5 million persons.

Congress finally authorized a Columbia River dredging project which will allow larger ships to sail to Portland. Construction began in August on a 4.2-mile bridge spanning the mouth of the Columbia near Astoria (see also BRIDGES). The structure will eliminate the final gap in Pacific Coast Highway 101, linking the Canadian and Mexican borders. Work also continued on the huge Cougar Dam (see DAMS).

Among the biggest news stories of the year were the Labor Day riot at Seaside in which more than 120 young people of college age were jailed; the birth of an elephant calf, Packy, at the Portland Zoo, the first elephant born in the United States in 44 years; and the storm of controversy surrounding a speaking tour of several college campuses by Gus Hall, secretary general of the U.S. Communist Party.

OTTAWA

The national capital of Canada, Ottawa lies on the Ottawa River, about 285 highway miles northeast of Toronto and 125 highway miles west of Montreal, in the Province of Ontario. With an area of about 28 square miles, the city had a population of 258,492 in 1961. Metropolitan Ottawa, which includes Hull, Quebec, across the river, together with two Ontario municipalities enclosed within the city, had a population of 418,399. The fifth largest metropolitan area in Canada, Ottawa is a bilingual city—French and English—with about 60% of its residents speaking the latter language.

The city government consists of a Board of Control and a Council. The former comprises a mayor, elected for a two-year term, and four elected controllers. The Council is composed of two aldermen from each of the city's 10 wards. Administrative functions are vested in the Board of Control, which is fully responsible to the Council. Charlotte Whitton was elected mayor for the third time on Dec. 3, 1962.

The city budget for 1962 called for expenditures of $62,282,178, an increase of 14% over the $54 million spent in 1961. Of this total, $23,757,305 was spent for education and $38,524,873 for general purposes. This sum was raised in the following manner: $33,698,191 from grants and the provision of services; $28,583,987 from taxation on real estate. The taxable assessed property valuation was $542,703,000. Business and commercial assessment amounted to $205,698,000; residential assessment, to $337,005,000.

The school system, consisting of public and separate (Roman Catholic) schools for primary education and public high schools for secondary instruction, is managed by elected boards operating under the jurisdiction of the provincial government. For 1962, enrollment figures were: public primary schools, 24,779; separate primary schools, 25,200; collegiate high schools, 16,600; University of Ottawa (Roman Catholic), 3,500; and Carleton University (nonsectarian), 1,950.

Ottawa has a limited amount of diversified industry, such as printing; sash, door, and planing mills; and scientific equipment. In 1962 there were 238 industrial plants, employing 9,275 persons; the value of factory shipments was $137,480,000.

An 18-month controversy over public housing was ended late in 1962 when the city council decided to construct at least 100 units for elderly people and low-income families at two points in the city. More developments of this sort were planned. Work proceeded on a giant collector sewer system, designed to keep pace with Ottawa's rapid growth and to overcome the problem of pollution in the Ottawa River.

The Garden of the Provinces, a formal garden with imaginative modern fountains, was opened in the heart of the city. Plans were announced for the clearing and renewal of a slum area, the Lebreton flats, in time for the centenary of Canada in 1967. An "embassy row" was also projected near Rideau Hall, the home of Canada's governor-general. A design was chosen for the Macdonald-Cartier Bridge, which was expected to open in 1965, replacing the Interprovincial Bridge between Ottawa and Hull.

PANAMA CANAL COMPANY

PACIFIC ISLANDS

The term Pacific Islands is used to signify the innumerable islands and island groups, chiefly of volcanic or coral origin, commonly referred to as Oceania. Oceania is divided into three main classifications (although authorities sometimes differ in which of these classifications they place certain fringe island groups):

(1) *Polynesia,* in the central and southeastern Pacific, includes principally Hawaii, Tonga, and Pitcairn Island (qq.v.), and Samoa (see AMERICAN SAMOA and WESTERN SAMOA); the Tuamotu, Society, Gambier, Tubuai, and Marquesas groups (see FRENCH POLYNESIA); and the Ellice and Phoenix groups (see WESTERN PACIFIC ISLANDS, BRITISH).

(2) *Melanesia,* in the western Pacific, includes mainly Fiji and New Caledonia (qq.v.); the Bismarck Archipelago, and the New Hebrides, Louisiade, Admiralty, Solomon, Loyalty, and Santa Cruz groups (see PAPUA AND NEW GUINEA and WESTERN PACIFIC ISLANDS, BRITISH); sometimes Australia, New Zealand, and the Malay Archipelago are also included.

(3) *Micronesia,* in the central Pacific, includes chiefly Nauru and Guam (qq.v.); and the Caroline, Marshall, Mariana, Gilbert, and Bonin groups.

U.S. PACIFIC ISLANDS

The Pacific islands of the United States are important mainly as strategic bases and landing points for sea and air traffic. Johnston Island, in the central Pacific, was the site for United States high-altitude nuclear testing in 1962 (see ATOMIC ENERGY).

Trust Territory of the Pacific Islands.—Comprising the Mariana (except Guam), Marshall, and Caro-

line island groups, this United Nations trust territory is administered by the United States, under an agreement with the UN Security Council which went into effect on July 18, 1947. The trust territory includes 2,141 islands grouped in 96 units or atoll formations (only 64 regularly inhabited), spread over some 3 million square miles in the western Pacific north of the equator. The total land area is about 700 square miles, with a population (1961 census) of 77,913. The principal inhabited islands are Truk (14,554), Ponape (10,964), and Saipan (7,464), which in July 1962 replaced Guam as the capital of the territory. The island peoples, broadly classified as Micronesian, include nine main linguistic groups. English is the official language; Japanese is widely spoken. Bikini and Eniwetok atolls in the Marshalls have served as sites for United States nuclear tests.

In an effort to meet some of the recommendations of the UN Trusteeship Council for acceleration of the preparation of the trust territory for eventual self-government and independence, President Kennedy issued an executive order on Aug. 21, 1962, opening the trust territory to United States citizens, shipping, and investment without prior U.S. Navy security clearance. The executive order was accompanied by a decision to undertake a vigorous program of political, social, and economic development, with the first priority given to education.

PACIFIC ISLANDS OF THE UNITED STATES

(Not including islands belonging to Hawaii and Alaska, and the Trust Territory of the Pacific Islands. Asterisk indicates reference to separate article.)

Island or group	Area (sq. mi.)	Population[1]
*American Samoa	76	20,051
Baker[2]	1	...
Canton and Enderbury[2, 3]	27	320
*Guam	212	67,044
Howland[2]	1	...
Jarvis[2]	1	...
Johnston[4]	..[5]	156
Kingman Reef[4]	..[6]	...
Midway[4]	2	2,356
Palmyra[7]	4	...
Wake[4]	3	1,097

[1] Census of April 1, 1960. [2] Under the administration of the Office of Territories, Department of the Interior. [3] An Anglo-American condominium in the Phoenix group of the Gilbert and Ellice Islands, used as air and communications bases; Enderbury Island was uninhabited in 1960. [4] Under U.S. Navy control. [5] Including nearby uninhabited Sand Island; total area, less than 0.5 sq. mi. [6] About 150 feet long and 120 feet wide at high tide; total area, including submerged shoals, about 40 sq. mi. [7] Administered by the Federal Aviation Agency.

Government.—The trust territory is administered by a high commissioner (Maurice Wilfred Goding, appointed April 24, 1961), under the direction of the U.S. secretary of interior. On May 7, 1962, President Kennedy transferred the administration of Saipan, Tinian, and other islands in the Northern Mariana group from the secretary of the navy to the secretary of interior. Native self-government is being developed on the municipal, district, and regional levels. A conference of elected native leaders meets annually as the Inter-District Advisory Committee to the High Commissioner. In the fiscal year 1961, revenue was $7,430,324, of which $1,296,956 was derived locally and the remainder was appropriated by the United States; obligations totaled $7,430,324.

Education and Religion.—Education is free and compulsory for children aged 8 to 14. School enrollment, as of June 30, 1961: 16,575. Number of schools (with enrollments): 190 elementary (14,400), 19 intermediate (1,804), and 6 secondary (371). In addition, 183 pupils attended high schools on Guam and 132 were in higher institutions on Guam and elsewhere. The population is predominantly Christian; mission schools play an important role in education.

Economy.—Subsistence farming, fishing, and the production of copra are the principal economic activities of the trust territory. Chief cash crops, 1961: copra, 13,868 tons (up 3,151 tons from 1960); trochus shell, 222,720 pounds (down 413,481 from 1960); and seafood, 546,170 pounds. Imports, fiscal 1961: $3,565,474 ($3,746,734 in 1960); exports, fiscal 1961: $1,839,792 ($1,891,300 in 1960). Principal trading partners are the United States and Japan.

Islands under United States Control.—The peace treaty between the United States and Japan, signed on Sept. 8, 1951, placed the Ryukyu, Bonin, and Volcano Islands and certain other Japanese-held islands of the western Pacific under United States jurisdiction, although Japan holds residual sovereignty. These islands were not specifically mentioned in the Japanese–U.S. Treaty of Mutual Cooperation and Security of 1960, but a minute to the treaty provided for mutual emergency defense measures for the islands and contained a declaration by the United States that it would do its utmost to secure the islanders' welfare.

Ryukyu Islands.—The Ryukyu Archipelago consists of three main groups—the Amami-gunto,[1] the Okinawa Islands, and the Sakishima Islands—extending some 500 miles southwest of Japan. The islands under United States control have a total area of 848 square miles and a population (Dec. 1, 1960) of 883,052 (excluding United States personnel and their dependents). The largest island, Okinawa (467 sq. mi.), contains important United States airbases. Naha (1959 pop., 218,000), on Okinawa, is the capital and chief city of the Ryukyus.

The administration of the islands is under a high commissioner (Lt. Gen. Paul W. Caraway took office on Feb. 16, 1961), assisted by a civil administrator (Shannon B. B. McCune was appointed in June 1962). The government includes a 29-member unicameral legislature, elected for a 2-year term, and a chief executive (Seisaku Ota, appointed Oct. 21, 1959). In the Nov. 11, 1962, elections, the Liberal Democratic Party, which favors cooperation with the United States authorities and a gradual reversion of the islands to Japan, won 17 seats in the legislature (a loss of 5); the moderately leftist Okinawa Socialist Masses Party won 7 seats (a gain of 2); the strongly anti-American Okinawa People's Party retained one seat; the Socialist Party won one; and independents, 3.

In order to meet the demand of the Ryukyuans for greater home rule, President Kennedy issued an executive order on March 19, 1962, which provided for the following: (1) the chief executive will be nominated by the legislature for appointment by the U.S. high commissioner, with the proviso that if the nominee was found to be unacceptable by the high commissioner he could appoint another of his choice; (2) the hitherto unlimited veto power of the high commissioner over acts of the legislature would be restricted to bills affecting foreign affairs, military security, or United States property; (3) the term of the legislature was lengthened from 2 to 3 years, and permission was granted to increase the number of seats in the legislature; (4) the civil administrator is to be a civilian instead of a United States general; and (5) changes are to be made in the provisions regarding jurisdiction over certain criminal acts by Americans in the islands. The changes announced by the president incorporated recommendations of a committee of inquiry that was sent to the islands in late 1961. Although the changes were greeted warmly by most Ryukyuans and Japanese, Premier Ikeda of Japan announced that Japan would continue to ask for the return of administrative rights over the islands.

The economy of the islands is greatly affected by the presence of United States military forces, which in 1961 spent about $95 million ($74 million in 1960). In June 1960 about 51,300 persons (13% of the labor force) were employed by United States forces. Agriculture, fishing, and food processing are the main economic activities. Chief crops are rice, sweet potatoes, sugar, and soybeans. Exports, 1960: $29.1 million ($21.1 million in 1959); imports, 1960: $133 million ($112 million in 1959).

Included in the Ryukyus are the Daito Islands (area, 18 sq. mi.; 1950 pop., 2,691), an island group 200 miles east of Okinawa. Sugar and phosphate are produced.

Bonin Islands.—Lying about 800 miles east of the Ryukyus, the Bonin Islands comprise three main island groups: Bailey Islands, Beechey Islands, and Parry Islands. The total area is 40 square miles and the population (July 1, 1960) is 204 (excluding United States personnel). The United States maintains a naval station on Chichi-jima, the principal island in the Bonins. Marcus Island, east of the main group, is usually classified with the Bonin Islands. Rosario Island lies west of the Bonins. The Bonins are administered by the U.S. Navy.

Volcano Islands.—An 86-mile chain of islands and islets, the Volcano Islands lie south of the Bonin Islands. The total land area is 11 square miles, and the population is 1,154. Iwo Jima, with an excellent airstrip which is used as a refueling point for U.S. Air Force planes, is the principal island. Parece Vela, a reef, lies about 400 miles southwest of Iwo Jima. The islands are administered by the U.S. Navy.

J. L. L.

[1] The Tokura-gunto (pop. 1950, 2,938) and the Amani Oshima (area, 471 sq. mi.; pop. 1953, 201,753) groups of the Ryukyus reverted to Japanese control on Dec. 5, 1951, and Dec. 25, 1953, respectively.

PAINTING AND SCULPTURE

Unlike 1961, when the American art world was electrified by all the publicity and activities stemming from the New York Metropolitan Museum's purchase of an important and very costly Rembrandt (*Aristotle Contemplating the Bust of Homer*), 1962 offered no extraordinary headlines save for a scandal. After "The Controversial Century: 1850–1950," an exhibition of paintings and sculptures from the collection of Walter P. Chrysler, Jr., had opened at the National Gallery of Canada, in Ottawa, connoisseurs attacked the genuineness of many of the displayed works. It was alleged that quite a few paintings, attributed by Mr. Chrysler to celebrated impressionists or postimpressionists, were fakes that he had bought from New York dealers whose business practices were suspect. The Art Dealers Association of America, formed in 1962 to establish a code of ethics in the art market, had already initiated an investigation and had brought the subject to the attention of the United States Customs and Internal Revenue services. By the end of 1962 the "Chrysler Affair" had not yet been concluded, and the scandal had jeopardized the tax-exempt status of the museum in Provincetown, Mass., where all these works of art are housed.

On the positive side, 1962 was characterized by the establishment of several new museums, and by the founding of a new periodical, *Art Voices from Around the World*, which called itself "an independent art magazine voicing news, views, and opinions on art." There were more art shows in 1962 than in any of the preceding years. The most original theme was "Fine Art in Sports," the first exhibition of the National Museum of Sport, which, though still in the planning phase, dedicated itself to "a greater appreciation of fine arts through the medium of the public's interest in sports." The range of the works of art displayed at New York's International Business Machines Gallery reached from an Etruscan discus thrower to a ball game depicted by Ben Shahn.

In 1962, American art lovers learned that, through the courtesy of the French government, in the year to follow they would be able to view Leonardo da Vinci's celebrated *Mona Lisa*, first at Washington's National Gallery of Art, and thereafter at New York's Metropolitan Museum of Art. The painting arrived in New York aboard the S.S. *France* on December 19.

Exhibitions.—The Solomon R. Guggenheim Museum, in New York, showed large expressionist paintings by Jan Muller, a refugee from Nazi Germany, who had died in 1958 at the dawn of his international fame. An exhibition of 200 British drawings and watercolors toured American museums from February to June; selected from the Mellon Collection, 12 British museums, and from Queen Elizabeth's private collection, they included some famous works by Turner. The Metropolitan Museum of Art, New York, displayed more than 200 drawings, illustrations, and watercolors by the satirist Thomas Rowlandson and his colleagues, shedding light on the London of around 1800.

Works by Fernand Léger on themes such as diving, cycling, and building, which occupied him during the last decade of his life, were shown at the Guggenheim. The San Francisco Museum of Art exhibited more than 75 items, from oil paintings to tiles, originally owned by two San Franciscans, Michael and Sarah Stein, brother and sister-in-law of Gertrude and Leo Stein. The Wadsworth Atheneum, Hartford, Conn., displayed 45 early and realistic paintings and sculptures by abstract artists, such as Pollock, de Kooning, and Rothko; the Metropolitan Museum: bibelots by Carl Fabergé, jeweler to Russia's czars and czarinas; the Allentown (Pa.) Art Museum: works by Benjamin West, the American innkeeper's son who became court painter to George II and president of the British Royal Academy.

The Guggenheim presented a review of works by Philip Guston, reaching from social realism to the peak of abstract expressionism; the Museum of Primitive Art, New York: 200 items of folk art produced by the primitive Asmat tribe in former Netherlands New Guinea and collected by young Michael C. Rockefeller, who was lost on an expedition in November 1961; the Museum of Modern Art, New York: surrealist works by 19th century masters (Odilon Redon, Gustave Moreau, and the printmaker Rodolphe Bresdin); the Brooklyn Museum: 220 works acquired over several decades by the late Louis E. Stern, an internationally known lawyer who owned works by Courbet, Rousseau, Cézanne, Bonnard, and Chagall, as well as African, Asian, and Egyptian art.

At the beginning of 1962, the show "Art Treasures for America" was seen at the National Gallery of Art and then traveled through many museums across the continent. The show highlighted the donation of the entire Samuel H. Kress Collection of old-master paintings to the nation. They have been, and will continue to be, distributed among colleges and museums that need good samples of French, German, Italian, Spanish, and Dutch paintings of the past.

The Metropolitan Museum showed a selection of its total of 141 master drawings purchased in 1961. Marking the first anniversary of the museum's new Department of Drawings, the show featured works by Poussin, Delacroix, David, Pordenone, Pietro da Cortona, Rubens, and Jan Brueghel the Elder.

The Baltimore Museum of Art presented an exhibition of Manet, Degas, Berthe Morisot, and Mary Cassatt. These artists, related in their personal lives as well as in their art, were represented by oils, pastels, watercolors, drawings, and prints.

"Geometric Abstraction in America," at the Whitney Museum of American Art, New York, surveyed the development of that style in the United States during the past three decades; it showed the work of artists who had drawn their inspiration from the Dutch De Stijl group or were influenced by the pioneer work of the German Bauhaus.

The Art Institute of Chicago showed "Treasures of Versailles," an exhibition of paintings, sculptures, tapestries, furniture, and objects of art from France's most famous palace. The exhibition was to be shown at three other American museums in 1963.

The Guggenheim Museum opened its fall season with "Modern Sculpture from the Joseph H. Hirshhorn Collection," including 444 pieces, from Rodin's *Burghers of Calais* to recent work by young sculptors.

The Philadelphia Museum of Art showed works by Thomas Eakins, who was born in Philadelphia in 1844 and died there in 1916. The show revealed him to have been one of America's truly great painters.

The first Riemenschneider exhibition in this country was staged at the North Carolina Museum of Art, in Raleigh. Twenty works by this Late Gothic sculptor were shown, half of them from museums in the Western Hemisphere, the others from the Louvre, the Rijksmuseum, and several West German museums.

The exhibition "16 German Painters," at Washington's Corcoran Gallery, acquainted Americans with a group of predominantly abstract artists, ranging in age from 27 (Roswitha Lüder-Vombeck) to 59 (Josef Fassbender).

At the Century 21 Exposition (Seattle World's Fair) the exhibition "Masterpieces of Art" consisted of paintings and sculptures from 57 American museums, and from the National Gallery of Canada, the Art Gallery of Toronto, the Montreal Museum of Fine Arts, the Louvre, the Tokyo National Museum, the Academia Sinica (Taipei, Taiwan), and the National Museum of India (New Delhi). In addition to this display of art, reaching from a jade piece of China's remote Shang Period to an oil by Picasso done in 1941, four other shows were made available to visitors to the fair: "Art Since 1950, American," "Art Since 1950, International," "Paintings by Mark Tobey," "Art of the Ancient East," and "Northwest Coast Indian Art."

The Venice Biennale of 1962 contained a United States pavilion, which was under the direction of René d'Harnoncourt, director of the Museum of Modern Art, in New York. The exhibitors were the painters Loren MacIver and Jan Muller, and the sculptors Louise Nevelson and Dimitri Hadzi. The two principal awards donated by Americans went to Europeans: the Arthur Lejwa Prize of New York, for a painter under 40 participating in the Biennale for the first time (Janez Bernik of Yugoslavia) and the David E. Bright Foundation of Los Angeles Award for sculpture (Humbert Dalwood of Great Britain).

In New York, noted one-man shows included those given to Sidney Nolan (Durlacher); Maurice Sterne (Hirschl & Adler); Colleen Browning (Isaacson); Kyle Morris (Kootz); Kahlil Gibran (Nordness); Georges Braque (Rosenberg); Richard Lippold (Willard); Marsden Hartley (Babcock); Leonard Baskin (Borgenicht); Mathias Goeritz (Carstairs); Reuben Nakian (Egan); Chaim Gross (Forum); Lovis Corinth (Frumkin); José Luis Cuevas (Herbert); Willem de Kooning (Janis); Henry Moore (Knoedler); Kenzo Okada (Parsons); Kenneth Armitage (Rosenberg); Ernst Barlach (St. Etienne); Jack Yeats (Willard); Ralph Rosenberg (Landry); Balthus (Matisse); Hans Boehler (Artist's Gallery); Jan Lebenstein (Chalette); Gregorio Prestopino (Nordness); Paul Klee (Silberman); Rufino Tamayo (Knoedler); Kenneth Noland (Emmerich); Richard Stankiewicz (Stable); Edvard Munch (Frumkin); Bernard Meadows (Rosenberg); and Kyoshi Saito (Nordness).

UPI

The world's most celebrated painting, Leonardo da Vinci's *Mona Lisa*, is uncrated in Washington, D.C., December 21, for its exhibition in 1963 at the National Gallery of Art.

New Museums, Expansions, and Gifts and Bequests.—The Museum of Modern Art, New York, announced that it will be extended 75 feet west and 55 feet east of the existing structure. The first step in the program will be the construction of a one-story administration building on West 54th Street, east of the present sculpture garden, allowing the present offices to be converted into galleries. The new building program is directed by Philip C. Johnson.

Adelyn D. Breeskin, former director of the Baltimore Museum of Art, was made director of the Washington (D.C.) Gallery of Modern Art. This new museum opened in October 1962 with a retrospective show of the late Franz Kline, whose paintings have exerted a considerable influence on contemporary art. New College, in Sarasota, Fla., received a large gift of money from Royal S. and Janet Reid Kellog. The donation is being used for the construction of the Kellog Art Gallery on the campus, adjacent to the John and Mable Ringling Museum of Art.

In New York, the building of the Gallery of Modern Art on Columbus Circle, sponsored by Huntington Hartford and designed by Edward D. Stone, neared completion in 1962. It was hoped that the museum would be able to open in the early part of 1963. The University of Pittsburgh announced plans to create the Henry Clay Frick Fine Arts Building, donated by Miss Helen C. Frick in memory of her father. Designed by B. Kenneth Johnstone Associates, the building will, in addition to classrooms, studios, and an

WIDE WORLD

A record price for the work of a living artist, $224,000, was paid for this two-sided work by Picasso at an auction of the Somerset Maugham Collection in London on April 10.

auditorium, contain galleries for works of art. In New York's Time-Life Building, the Museum of Early American Folk Arts held its first exhibition with a show of more than 100 objects, many of which had never been exhibited before.

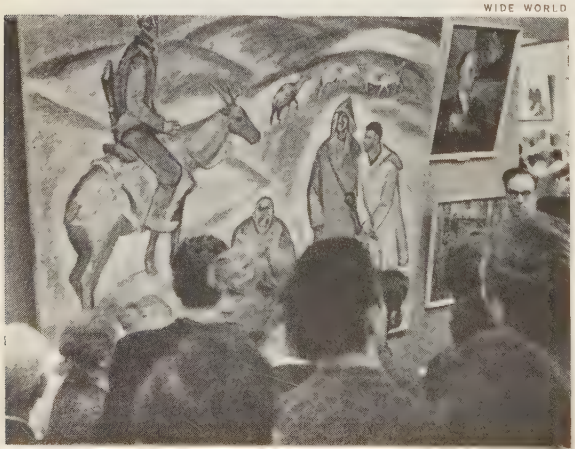
Changing its name from Albright Art Gallery to Albright-Knox Art Gallery, Buffalo's art museum opened a new wing donated by Seymour Knox, the collector of contemporary art. The Minneapolis Institute of Arts opened an American wing named in honor of James Ford Bell, a collector of American art. In addition to paintings and sculpture, the wing includes furniture, glass, fine silver, and four complete Colonial rooms. In Poughkeepsie, N.Y., the Vassar College Art Gallery celebrated its reopening and complete rebuilding with a loan show of paintings and drawings by Hubert Robert, the 18th century French landscape painter.

The Wadsworth Atheneum in Hartford, Conn., announced the acquisition of three important Rembrandts: *Portrait of a Young Man, Portrait of Saskia,* and *Landscape with a Cottage.* A fourth Rembrandt, acquired by the Denver Art Museum, was *Saskia as Minerva,* a small wood panel painted when the artist was 26. One of the few surviving examples of early 14th century painting, a seven-panel altarpiece by Ugolino da Siena, collaborator and later rival of Duccio, was acquired by the Sterling and Francine Clark Art Institute, in Williamstown, Mass.

The Dallas Museum of Fine Arts bought *That Gentleman,* by Andrew Wyeth, for $58,000, which is believed to be the highest price ever paid by a museum for a painting by a living American artist. Maxim Karolik, who in 1941 had donated to the Museum of Fine Arts in Boston his superb collection of American art from the 1720 to 1820 period, added to this collection a large number of 19th century oils, watercolors, and drawings by John Frederick Peto, Henry F. Darby, and others.

In Moscow on December 19, spectators gather before one of several modernist paintings attacked by Premier Khrushchev.

WIDE WORLD



Art Thefts.—There were fewer sensational robberies in 1962 than in the previous year, although the biggest art theft in British history occurred on July 10, when 35 impressionist and modern French paintings were taken from the O'Hana Art Gallery, in London; the property, valued at $980,000, was recovered on July 27. Most of the works lost in the two great French robberies of 1961 turned up in 1962: the eight Cézannes missing from the Vendôme Pavilion, Aix-en-Provence, since Aug. 13, 1961, were found in Marseille on April 11; and all but one of the 57 paintings stolen from the Annonciade Museum in Saint Tropez on July 16, 1961, turned up near Paris on Nov. 16, 1962. The major unsolved theft was that of Goya's *Duke of Wellington,* which disappeared from the National Gallery, London, on Aug. 21, 1961.

Auctions.—At a comprehensive sale of modern paintings, drawings, and sculptures auctioned at the Parke-Bernet Galleries, New York, on Jan. 11, 1962, August Macke's *Composition* (1913) in watercolor, crayons, and chalks, brought $3,000; a pastel by Giacometti, *Summer Day* (1927), $2,400; and Lyonel Feininger's *Shipping* (1939), in pen and watercolor, $2,300. A March 21 sale of paintings, drawings, and sculptures from the collections of Mr. and Mrs. Charles Goldman, Mr. and Mrs. Arthur Murray, Folke Heybroek of Sweden, the Estate of Martha A. Alford, and other sources, included several outstanding paintings by Monet, Sisley, Redon, Mondrian, Léger, Rouault, Bonnard, and Modigliani, as well as sculptures by Daumier, Rodin, and other masters. The sale realized a total of more than $1 million. The highest price, $72,500, was brought by Sisley's *Winter at Louveciennes,* followed by $65,000 for Monet's *Trellises with Flowers.* Sisley's *Banks of the Loing at Moret* brought $60,000; his *Old Houses at Veneux-Nadon* and Monet's *Customs Guards' Cabin* were each purchased for $55,000; and an early Mondrian, *Kerktoren,* was sold for $47,000, a record price at auction for a work by this artist.

On April 11, modern paintings, drawings, and sculpture belonging to the American Federation of Arts were sold at auction for the benefit of the federation's building fund.

Two sales at the Parke-Bernet Galleries in October 1962 offered old masters: On October 24, paintings and early sculptures collected by John and Johanna Bass were sold. The paintings included a small Rembrandt, *Head of an Old Man* (c. 1632); Van Dyck's portrait of Bishop Antoon Triest; Rubens' *Holy Family,* from the collection of Sir Frederick Cook, Bart., Richmond, England; *Self Portrait of the Artist,* an early work of Jan Vermeer of Delft; and portraits by Reynolds and Lawrence. On October 31, 22 paintings were auctioned from the collection of Mr. and Mrs. Norman B. Woolworth, including a Chardin still life, *A Slice of Salmon* (c. 1730–40).

Prizes and Awards.—Two large grants were given by the Ford Foundation through the Archives of American Art: Harlan Philipps is directing an oral-history project at Brandeis University, to put on tape the recollections of outstanding figures in the art world—a painter, a sculptor, a critic, and a collector; Charles Van Ravenswaay is in charge of the other project, to identify and examine for the Missouri Historical Society the contribution made by German colonies in the Missouri Valley from 1830 to 1860.

Paintings, sculptures, and other art objects valued at more than $1 million were left to art museums and colleges under the will of the late Loula D. Lasker. While the bulk of the collection was left to the Bezalel Museum (Jerusa-

lem) and the Tel Aviv Museum, ten American museums and colleges also received a number of works, all by modern masters.

The sculptors Isamu Noguchi and Alexander Archipenko were elected to membership in the National Institute of Arts and Letters, the highest honor society of the arts.

The sculptor Alexander Calder was presented with one of Brandeis University's 1962 Creative Arts awards, while the sculptor David Slivka received a cash grant and Creative Arts Citation from the same institution.

Alfred Blaustein, American printmaker, was awarded a cash prize for his etching *The Tangle*, selected as the best print in any medium at the 44th annual exhibition of the Society of American Graphic Artists.

Samuel Adler received a purchase award for his collage, *Old Ferry Landing*, from the Staten Island Institute of Arts and Sciences in connection with the celebration of its 80th anniversary.

Sculptor and designer Harry Bertoia was commissioned by the Reynolds Metals Company to create an aluminum sculpture for the 1962 R. S. Reynolds Memorial award, given annually with an honorarium of $25,000 to an artist chosen by a jury from the American Institute of Architects.

Charles Sheeler, the American painter and photographer, received the 1962 Award of Merit medal and prize of $1,000 from the American Academy of Arts and Letters.

The American sculptor Louise Nevelson was awarded the $3,000 grand prize in the First Sculpture International of the Center of Visual Arts of the Torcuato Di Tella Institute, in Buenos Aires, Argentina.

Alfred H. Barr, Jr., director of the collections of the Museum of Modern Art, and Alexander Calder, the American sculptor known as the inventor of the mobile, were the winners of the 1962 Art in America annual award for out-

standing contributions to American art, which includes a cash prize and a medal designed by Seymour Lipton.

Necrology.—Some of the finest artists, as well as a number of art dealers and writers on art, died in 1962. These included the leading surrealist painter, author, and costume designer, Kurt Seligmann (61); the authority on Chinese art and member of the Princeton University faculty, George Rowley (69); the internationally known sculptor and resident sculptor at the University of Notre Dame, Ivan Meštrović (78); the art historian and member of the Institute for Advanced Study at Princeton University, Paul Frankl (83); the New York art dealer Vladimir de Margoulies (64); the New York portrait painter Ivan G. Olinsky (84); the art historian and director of the art galleries at the University of Notre Dame, Maurice H. Goldblatt (77); the art critic Henry McBride (94); the New York art dealer Kurt M. Stern (67); the painter, illustrator, and author Rafaello Busoni (62); the marine illustrator Anton Otto Fischer (80); the retired curator of prints at the New York Public Library, Frank Weitenkampf (96); the abstract painter Morris Louis (49); the painter and director of the arts workshops at New York's New School for Social Research, Camilo Egas (62); the leader of abstract expressionist painting Franz Kline (51); the painter Eugene Speicher (79); the artist and humorist Ludwig Bemelmans (64); and the former director of New York University's Institute of Fine Arts, Walter Cook (74).

PAKISTAN

The Republic of Pakistan, formerly part of British India, is located in south central Asia. It consists of the provinces of East Pakistan and West Pakistan, which are separated by 920 miles of Indian territory. The total area is 365,037 square miles,[1] of which only 54,501 square miles are in the eastern province; at the 1961 census the population aggregated 93,831,982, and in mid-1962 it was estimated at 96,558,000 (about 55% in East Pakistan). Approximately 85% of the people are Muslims, and most of the rest are Hindus. The chief cities, with their 1961 census populations, are Karachi, the former capital (1,916,000); Lahore (1,297,000); Dacca (558,000); Hyderabad (434,000); Lyallpur (426,000); Chittagong (363,000); and Rawalpindi (343,000), the temporary capital until the completion of adjacent Islamabad. The official languages are English and the two national languages, Urdu and Bengali.

Government.—Under the benevolent dictatorship of President Mohammed Ayub Khan since 1958, Pakistan received a new constitution on March 1, 1962. Basically presidential rather than parliamentary in nature, the constitution embodies a succession of tiered electorates, known as basic democracies, in which some 80,000 electors choose 150 members of the National Assembly (6 additional seats are reserved for women, who are chosen by the two provincial assemblies). This body, which is largely advisory, has its principal seat in Dacca.

Education.—Estimated illiteracy: 84%. Number of schools (with enrollments), 1960: 44,222 primary (5,204 for girls), 4,469,490; 6,030 secondary (734 for girls), 1,345,549; 3,010 other schools and colleges, 396,751; and 6 universities, 7,843.

Finance.—Revenue budget, 1962–63: revenue, Rs.2.14 billion (Rs.2.23 billion in 1961–62; 1 rupee equals U.S.$0.21); expenditure, Rs.1.96 billion (Rs.1.90 billion). Capital budget, 1962–63: revenue, Rs.2.97 billion (Rs.2.25 billion in 1961–62); expenditure, Rs.2.93 billion (Rs.2.27 billion). Gold and foreign exchange: $352 million on Sept. 30, 1962 (down $13 million from a year earlier). Cost-of-living index (1958 = 100): 105 in 1961 (103 in 1960).

Transportation and Communications.—Transport networks (miles, 1961): railways, 7,047 (193,366,000 passengers and 19,803,000 tons of freight in 1961–62); roads, over 70,000 (10,775 all-weather); navigable waterways, 2,800 in East Pakistan (4,000 in the monsoon season). Chief ports: Karachi (5,342,000 tons handled in 1961–62); Chittagong (2,896,000); and Chalna (1,001,000). National airlines: Pakistan International Airlines; Pakistan Aviation, Ltd. Telephones (1961): 79,586.

Manufactures and Minerals.—General index of industrial production (1958 = 100), 1961: 132 (119 in 1960). Industrial products (long tons, 1961): cotton yarn, 185,100; jute goods, 250,354; sugar, 123,462; newsprint, 28,800; sea salt, 185,100; cement, 1,223,000; steel ingots, 8,517; superphosphate, 8,048; ammonium sulfate, 50,506; sulfuric acid, 4,754; chromite, 25,103; limestone, 1,176,442; fire clay, 16,065; coal, 906,000; crude petroleum, 373,000; cotton fabrics, 699,035,000 yards; silk and rayon fabrics, 21,987,000 square yards; cigarettes, 12,065,000,000 units; rubber tires and tubes, 3,982,000 units; natural gas, 34,664,777,000 cubic feet; electricity (1960), 1,449,894,000 kw.-hr.

Agriculture.—Index of agricultural production (1949–53 = 100), 1961–62: 128 (124 in 1960–61). Chief crops (thousands of long tons, 1961–62): clean rice, 10,575; wheat, 3,943; bajra (bulrush millet), 364; jowar (grain sorghum), 245; corn, 487; gram, 614; sugarcane, 17,434; cotton, 322; jute, 1,244; tea, 26; wool (greasy basis), 14.

Foreign Trade.—Total exports, fiscal year 1961–62: Rs.1,843,429,000 (Rs.1,799,371,000 in 1960–61); imports, Rs.3,109,098,000 (Rs.3,187,635,000).

[1] Including Gwadar (300 square miles), ceded by Muscat and Oman in 1958, but excluding the disputed state of Jammu and Kashmir (see Kashmir) and the minor areas of Gilgit, Baltistan, Junagadh, and Manavadar.

Chief exports: textiles, cotton and jute fibers, rice, fish, and hides and skins. Chief imports: cereals, petroleum products, vegetable oils, chemicals, pharmaceuticals, iron and steel products, machinery, transportation equipment. Principal customers (thousands of rupees, 1961–62): United Kingdom, 294,477; United States, 175,172; India, 151,515; Belgium-Luxembourg, 110,064; Japan, 108,644; West Germany, 98,468; South Africa, 91,120; France, 84,507. Principal suppliers (thousands of rupees, 1961–62): United States, 958,756; United Kingdom, 634,078; West Germany, 292,857; Japan, 247,074; Iran, 115,140; India, 107,093.

Events, 1962.—During the first two years of Pakistan's Second Five-Year Plan (1960–65), national income rose by 9.8%. For the second and third years of the plan, Pakistan estimated its foreign aid requirements at $945 million. Meeting in Washington on Jan. 24–25, 1962, members of an international consortium agreed to furnish assistance totaling this sum, as follows: United States, $500 million; International Bank for Reconstruction and Development, and International Development Association, $209.4 million; West Germany, $80 million; United Kingdom, $47.6 million; Japan, $45 million; Canada, $38 million; and France, $25 million. Among the numerous development projects under way in Pakistan, two were completed early in the year: the Guddu Barrage in West Pakistan, in February; and the $73.5 million Karnaphuli Dam in East Pakistan, in March. While production of food grains improved during 1961 and 1962, considerable amounts continued to be imported (an agreement of October 1961 called for the purchase of United States surplus agricultural commodities worth $621,550,000 over a four-year period).

UPI

President Ayub Khan of Pakistan (right), on an unofficial visit to the United States, meets U.S. Secretary of State Dean Rusk at a luncheon in New York City on September 27.

Politically, the major events of 1962 were the proclamation of the new constitution on March 1 (see above, *Government*) and the election of the National Assembly on April 28. Elections for the two provincial assemblies followed on May 6. The constitution reflected President Ayub's distrust of traditional democracy. Not only was the National Assembly elected indirectly, but the powers of the presidency were extensive. Opposition to the constitution's provisions came from adherents of the various political parties, the revival of which was permitted in legislation approved on July 16. Meanwhile, on June 8, martial law was ended after 44 months. A former prime minister, Huseyn S. Suhrawardy, whose arrest on January 30 had been the pretext for student riots in East Pakistan, was freed on August 19.

Pakistan's relations with her neighbors, Afghanistan and India, continued to be unpleasant. At Pakistan's request, the UN Security Council considered the perennial question of Kashmir from April 27 to June 22, when the 100th veto of the USSR defeated an Irish resolution urging direct negotiations between Pakistan and India to settle the dispute. Meanwhile, the Pakistani government entered into negotiations with Communist China concerning its own Kashmiri frontier (an agreement in principle was announced on December 26). After Communist Chinese forces launched a strong attack against India on October 20, the United States and Great Britain urged Pakistan not to press the Kashmir issue. Pakistan, which had felt that the Western powers were not supporting her sufficiently against India, expressed concern over the military assistance now being rushed to New Delhi, and neutralist views were aired in the National Assembly.

Nevertheless, American-Pakistani relations remained cordial. Mrs. John F. Kennedy visited Pakistan in March, and President Ayub went to the United States in September. Later, on November 28, the good offices of Assistant Secretary of State W. Averell Harriman and of Duncan Sandys, British secretary of state for Commonwealth relations, produced the announcement of an agreement for Indo-Pakistani negotiations on Kashmir. Talks were held at the ministerial level in Rawalpindi on December 27–29.

On September 18, the Pakistani delegate, Muhammad Zafrulla Khan, was elected president of the UN General Assembly. Meanwhile, Pakistan furnished the United Nations with a force to keep order in West New Guinea during the transitional period between Dutch and Indonesian rule.

PANAMA

Occupying the isthmus between North and South America, the Republic of Panama is divided by the 10-mile-wide Canal Zone, which was granted to the United States in 1903. The population (1961 est.) is 1,084,000 in an area of 28,576 square miles. About 44% of the population is concentrated in the central part of the country, in and around the cities of Panamá (271,425 in 1960) and Colón (59,360). Much of the population is of mixed European and Indian descent; there is also a large Negro population. Spanish is the official language.

Government.—Under the constitution of 1946, Panama is governed by a president and a unicameral National Assembly of 53 deputies, elected for 4-year terms by direct popular vote. The president (Roberto F. Chiari, who took office on Oct. 1, 1960) serves for four years and is not eligible for immediate re-election. The 9 provinces have governors appointed by the president.

Education and Religion.—Educational facilities have been expanded in recent years, but probably a third of the population remains illiterate. For the 1961–62 school year, enrollment in the public schools was a record 157,443 for primary classes and 24,000 for secondary; and some 4,500 students enrolled at the University of Panamá. Roman Catholicism is the predominant religion (over 90% of the population).

Finance.—The balboa, the monetary unit, is at parity with the U.S. dollar. The public debt has been growing rapidly for several years because of trade deficits (see below, *Foreign Trade*) and government spending in excess of

revenues, in the hope of expanding and improving national economic activity. By the end of 1961 the national debt stood at $95.2 million. There was considerable debate over the budget for 1962, finally set at $66.8 million, or $3.7 million more than the original ordinary budget figure for 1961. The high level of expenditures was defended by the imposition of new taxes, approval of legislation to increase the efficiency of tax administration, and expansion of the share of the budget devoted to social and economic development. As usual, the budget figures were revised upward during the year. Government receipts in 1961 were $82.89 million, and expenditures totaled $99.37 million (both sums include loan funds from outside the budget).

Transportation and Communications.—The total 335-mile length of the Inter-American Highway from Panama City to the Costa Rican border is open to all-weather traffic, but important sections are not yet paved. Passenger cars totaled 16,100 in 1960; commercial vehicles, 7,800. In October 1962 the high bridge over the Pacific end of the canal was opened, and may be expected to stimulate planning for extension of the Inter-American Highway into the roadless area between Panama City and the Colombian border. (See also BRIDGES.) The access road construction program, a necessity for economic development, received new financial aid from the United States in 1961 and 1962. Public railways, totaling 70 miles, connect the Atlantic and the Pacific. In 1961 the total gross tonnage of the large foreign-owned merchant fleet registered in Panama was 5.4 million. Telephones number 28,672 (1960); radios, 163,000 (1959); and television sets, 30,000 (1962).

Production.—Many Panamanians are engaged in agriculture at or near the subsistence level, and low agricultural productivity makes necessary imports of foodstuffs which constitute a substantial charge on the limited national resources. In 1961 insufficient production of rice and corn for domestic consumption made imports necessary. Manufacturing is growing slowly, but remains small. There is chronic heavy unemployment in the towns. The government subsidizes some agricultural and industrial production by means of price supports, tariff protection, and other measures.

In 1961, President Chiari announced a 4-year $206.7 million plan for economic and social development by participation in the Alliance for Progress. It was expected that only about $10 million of the cost of this program would be financed by foreign loans.

Electric power production in Panama City and Colón in 1961 was 206 million kw.-hr., compared with 180 million in 1960. Herds of livestock continued to increase (up 34% in the past 10 years), but export markets still could not be found for this product. (For export crops, see below, *Foreign Trade.*)

Economic Indicators.—Economic growth quickened in 1961. An increase of 8% in the gross national product gave a total of $460 million, or an annual national income of $415 per capita, a gain of 5% over 1960. The cost-of-living index (1958 = 100) in 1961 and the first half of 1962 was 101. The index of agricultural production (1952–57 = 100) in 1959–60 was 119. Building permits in Panama City totaled $9.2 million in 1961, down slightly from 1960.

Foreign Trade.—Panama's commodity exports always are much less than her imports, and the disparity has been increasing in recent years. In 1960 the apparent excess of commodity imports over exports reached a record $89.6 million; and in 1961 the imbalance ran even higher, at $100.3 million. Total imports in 1961 were $121.78 million ($109.19 million in 1960), while exports were $21.75 million ($19.5 million in 1960). The trade gap continued to grow during the first quarter of 1962, with imports at $33.4 million and exports at $8.5 million, for a deficit of $24.9 million, compared with the $21.9 million gap in the first quarter of 1961.

The increase in export values in 1961, due to improvement in the banana and shrimp trade, would have been much greater except for the sharp decrease in coffee exports. In 1961, bananas again accounted for more than one half the value of Panama's exports: 7.65 million stems, worth $13.38 million. Other exports in 1961: shrimp, $5.85 million ($4.99 million in 1960); cacao, $507,000 ($769,000); coffee, $258,000 ($1.1 million). Colón Free Zone operations in 1961 increased $24.91 million, or 19%, over 1960, to a total of $156.36 million (incoming and outgoing). The United States is Panama's principal trading partner.

The customary large visible trade deficit is narrowed considerably by tourist expenditures, income from ship registrations, Colón Free Zone operations, and, most important of all, from indirect benefits to the Panamanian economy derived from the Canal Zone—the wages of Panamanians working in the Canal Zone, and purchases in Panama by American residents and agencies in the Canal Zone. The United States calculates these indirect benefits to Panama at $50–$60 million annually. A final reason for revising downward the apparent international trade imbalance of Panama is her practice (according to the International Monetary Fund) of considerably undervaluing her banana exports.

Events, 1962.—Much Panamanian discussion in 1962 continued to revolve around the Panama Canal. There was speculation, as for several years past, about the possibility of construction of a sea-level canal (in Panama or elsewhere), and the probable effects on Panama. Of more immediate importance were the continuing demands in Panama for revision or abrogation of the Panama Canal Treaty of 1955 with the United States. In June, President Chiari conferred with President Kennedy in Washington. It was announced that the two presidents had agreed to arrange discussions on the treaty, and that they had found bases for the solution of some of the questions at issue: the flying of more Panamanian flags in the Canal Zone; the promotion of more Panamanian sales in the zone; the principle of equal labor opportunity and equal wages for Panamanians in the zone; and the withholding by the United States, in the Canal Zone, of income taxes from the wages of Panamanians, on behalf of the government of Panama.

On his return to Panama, President Chiari found that many political leaders considered that he had obtained too little in Washington. This criticism gave some stimulus to the already evident political maneuvering in preparation for the presidential election of 1964. On September 25, Panama's foreign minister, Dr. Galileo Solis, made a bitter and unexpected attack on the canal treaty in the UN General Assembly. He said, however, that his delegation would refrain from raising the question at the United Nations at that time because of President Kennedy's "high statesmanship" and willingness to pursue discussions for an equitable solution. The attack indicated that despite progress in the June talks and the agreements reached, the canal treaty remained a major source of friction in United States–Panama relations.

Also of concern to Panamanian political leaders were the costs (economic, social, and political) of implementing the economic and social reforms that the United States wished begun as a condition of Alliance for Progress aid. A considerable expansion of educational facilities was under way in 1962, with American financial aid. In February the minimum-wage law passed in 1961 went into effect for some industries in the provinces of Panamá and Colón. The law provides for hourly minimums ranging between 45 and 60 cents. On the other hand, the proposed agrarian reform remained stalled in 1962.

(See also PANAMA CANAL AND CANAL ZONE.)

ROBERT JONES SHAFER,
Professor of History, Syracuse University.

PANAMA CANAL and CANAL ZONE

The Panama Canal cuts across the Isthmus of Panama and connects the Atlantic and Pacific oceans. It extends 51.6 miles from deep water to deep water, and about 40.3 miles from shore to shore. The canal is within a 10-mile-wide strip of land known as the Canal Zone, which in 1903 was granted in perpetuity to the United States by the Republic of Panama. The United States was given the right to act as sovereign in the area "to the entire exclusion of the exercise by the Republic of Panama of any such sovereign rights." In return for the grant, the United States guaranteed the independence of the republic, paid $10 million, and agreed to pay an annuity of $250,000, which was subsequently increased to $1,930,000 per year.

Including tidal water, the Canal Zone covers 648 square miles. Only employees of the United States government may live within the zone, and no private businesses are permitted except those directly related to canal operations.

Population.—The 1960 census reported a population of 42,122, compared with 52,822 in 1950. Of the canal

organization's 14,000 employees, approximately 3,500 are United States citizens.

Administration and Government.—The Canal Zone government, created by Congress, maintains such functions as police and fire protection, schools, postal service, magistrates courts, and public health and sanitation facilities. Its net operating costs, amounting to about $12 million annually, are repaid to the U.S. Treasury by the Panama Canal Company. The company, which is a corporation wholly owned by the United States government, operates the canal. Although the company has not raised canal tolls, increased shipping traffic and the adoption of operating efficiencies have made possible a small operating net margin after paying the cost of the Canal Zone government plus interest of $10 million a year on the unrecovered United States investment in the Canal Zone, which is slightly under $500 million. Capital improvements in the waterway are financed by the margin structure.

The governor of the Canal Zone is appointed by the president of the United States and is automatically president of the Panama Canal Company. In 1962 Maj. Gen. Robert J. Fleming, Jr., was named governor by President Kennedy. Administrative headquarters for the company and government are at Balboa Heights.

Education.—School attendance is not compulsory for children living in the Canal Zone. Separate United States and Latin American school systems are maintained. The former, attended primarily by United States citizens, are modeled after school programs in the United States. Spanish is taught as a language course in every grade. The Latin American schools are attended by non-United States citizens and are comparable in curriculum with the schools in Panama. The curriculum is in Spanish.

Canal Traffic.—During the fiscal year ending June 30, 1962, there were 11,149 oceangoing transits of commercial vessels weighing more than 300 tons net, a new record for the 11th consecutive year. Cargo shipments totaled 67,525,000 long tons, and tolls amounted to $57,290,000, both also new records.

Events, 1962.—Extensive improvement projects continued in 1962. These included further widening of the eight-mile-long channel through Gaillard Cut from 300 to 500 feet ($47 million); illumination of Gaillard Cut; and installation of new electric towing locomotives at the locks ($8 million).

On October 12 the $20 million Thatcher Ferry Bridge across the Pacific entrance of the canal was dedicated in ceremonies jointly conducted by Panama and the United States. The bridge, built by the United States, serves as a major link between eastern and western Panama and will carry traffic using the Inter-American Highway. (See also BRIDGES.)

During the 1962 fiscal year, Canal Zone spending in the republic amounted to $75 million. Expanded emphasis was given to on-the-job and apprenticeship training for Panamanians employed in the Canal Zone.

In June, President Chiari of Panama met with President Kennedy to discuss Panama-Canal Zone relations. As a result of the talk, the Panamanian flag was flown side by side with the United States flag in all civilian areas, and a number of other concessions requested by Panama were granted.

WILLIAM G. AREY,
Panama Canal Information Officer.

PAPER INDUSTRY

New highs in production, consumption, and dollar sales of paper and allied products were established in the United States in 1962. Consumption of paper and paperboard totaled about 42 million tons—an average of 450 pounds per person. Exports amounted to 1.2 million tons; imports totaled 5.8 million tons, of which 5.2 million tons represented newsprint from Canada.

Wood pulp production in 1962 totaled 28 million tons, which required 44 million cords of pulpwood. About 1.2 million tons of wood pulp were exported, and another million tons or so used for acetate, rayon, cellophane, and other nonpaper products. The domestic paper industry used 28 million tons of wood pulp, of which 2.8 million tons were imported. It used 9 million tons of waste paper and 900,000 tons of rags, straw, and other fibrous materials. It employed 600,000 persons, who were paid $3.9 billion. Corporate sales totaled a record $13.5 billion, on which earnings (after taxes) amounted to about 4.6%.

U.S. PAPER AND PAPERBOARD PRODUCTION
(In thousands of tons of 2,000 pounds)

Category	1959	1960	1961	1962[1]
Newsprint	1,924	2,004	2,054	2,100

Construction board	1,905	1,784	1,842	1,840
Grand total[2]	34,054	34,444	35,585	37,490

[1] Estimates [2] Columns do not always add to totals shown because of rounding.

As of the end of 1962 the United States paper industry's investment in foreign enterprises was valued at about $940 million, of which $785 million were in Canada, $57 million in Latin America, and $73 million in Europe. The paper industry has demonstrated its ability to compete in foreign markets—particularly in Europe—provided no discriminatory tariff barriers are erected, and industry representatives so testified at various congressional hearings on the 1962 trade expansion bill.

The industry took a long step into the electronic age in 1962. Now in operation is at least one papermaking machine monitored by an electronic computer. This computer measures several variables of the paper-making process and types out readings on a remote reading board at regular and frequent intervals. One major computer manufacturer has in operation an 8-inch wide experimental papermaking machine fully controlled by a computer.

The year also saw the introduction into the United States of the Inverform, a machine which enables wood pulp fibers to be introduced at several places along the paper-forming wire screen, permitting better sheet formation and higher speeds.

BENJAMIN SLATIN,
Economist, American Paper and Pulp Association.

PAPUA AND NEW GUINEA

Comprising the eastern half of the island of New Guinea, the Territory of Papua and New Guinea consists of two distinct territories joined in an administrative union with a total area of 183,540 square miles and a population (1961 est.) of 1,972,361, of whom 25,330 are nonindigenous. The indigenous population comprises Papuans and Melanesians of many cultural and linguistic groups. There is also a small proportion of Negrito people. More than 700 distinct languages are spoken by the indigenous population; English is the official language. Administrative headquarters is at Port Moresby (1961 est., 28,000), Papua's chief port.

Papua, Territory of.—Papua (area, about 90,600 square miles; pop. est., 523,442) is an external territory of Australia. It comprises the southeastern portion of the mainland of the island of New Guinea (area, 87,806 square miles), and the offshore Trobiand Islands, Woodlark Island, D'Entrecasteaux Islands, and the Louisiade Archipelago (aggregate area, 2,794 square miles).

New Guinea, Territory of.—This trust territory of the United Nations (area, 93,000 square miles; pop. est., 1,448,919) comprises the northeastern portion of the island of New Guinea (area, 70,200 square miles), the Bismark Archipelago (New Britain, 14,100 square miles; New Ireland, 3,340 square miles; Lavongai, 460 square miles; and the Admiralty Islands, 800 square miles), and the northernmost Solomon Islands (Bougainville, 3,880 square miles; and Buka, 220 square miles), the rest of the Solomons constituting the Solomon Island Protectorate (see WESTERN PACIFIC ISLANDS, BRITISH).

The two territories are administered as a unit by Australia, acting through an administrator (Sir Donald M. Cleland, who took office in 1953). He is assisted by an Administrator's Council (which includes one indigenous and one nonindigenous elected member), and a 37-member Legislative Council (which includes 6 elected and 6 appointed indigenous members). The government budget for 1962 was estimated at £A28,680,000 (the Australian pound equals U.S.$2.24). In 1962 there were 3,348 schools, with 200,095 pupils. There are 6,686 miles of roads and 253 airfields and airstrips in the two territories.

Most of the population is engaged in primitive subsistence agriculture (sweet potatoes, taro, sugarcane, sago palm, cassava, and bananas). Of the major export crops, the indigenous population produces about 25% of the copra and cocoa, 33% of the coffee, and 15% of the peanut crop. Total exports in 1960–61 were valued at £A16,606,000; imports, £A26,738,423. Chief exports: copra and coconut products, £A7,770,000; cocoa beans, £A1,666,000; rubber, £A1,292,151; plywood and other timber, £A1,173,561; coffee, £A1,105,960; and gold, £A681,395.

In February 1962, disturbances over the refusal of natives to pay taxes broke out on Buka Island in the northern Solomons. More than 50 persons were injured and over 200 persons were arrested before the disturbances ended. The tax revolt was reportedly sparked by a bearded cult whose members have reverted to the ways of the islanders before the arrival of the Europeans a century ago.

PARAGUAY

Situated mainly in the temperate zone of South America and bounded by Argentina, Brazil, and Bolivia, the landlocked Republic of Paraguay occupies an area of 157,047 square miles. Its principal access to the Atlantic Ocean is the Paraguay River, which divides the country into two distinct regions: the almost uninhabited Chaco grassland of western Paraguay (95,338 square miles) and the fertile, well-watered sector of eastern Paraguay, where 95% of the estimated mid-1962 population of 1,857,000 live. The bilingual (Spanish and Guaraní) population is largely mestizo. The capital city of Asunción has an estimated metropolitan population of 300,000. Other leading cities are Encarnación (40,906), Coronel Oviedo (34,442), Concepción (32,556) and Villarica (27,795).

Government.—Paraguay is a unitary republic with a highly centralized presidential form of government. The 1940 constitution vests executive power in a president (Gen. Alfredo Stroessner, reelected to his third 5-year term on Feb. 10, 1963) and in a 10-member cabinet appointed by him. An appointed Council of State acts as an advisory body to the executive. The 60-member Chamber of Representatives is chosen by proportional representation (all 60 in 1962 were members of the president's Colorado Party).

Education and Religion.—School enrollment, 1961: 327,204 (about 50% of the school-age population). Number of schools (with enrollments), 1961: 2,040 primary (294,000); 97 secondary and technical (23,122); 34 teacher-training (7,100); the National University in Asunción (2,982). Principal religions: Roman Catholicism (89% of the population); Protestants, 25,000.

Finance.—Government revenue, 1961 est.: 2,654 million guaraníes (2,741 million in 1960); expenditure, 2,719 million guaraníes (2,741 million in 1960). (126 Gs. equal U.S.$1.) Estimated 1962 expenditure: 3,064 million Gs. Foreign exchange reserves on June 30, 1962: $3.5 million.

Transportation and Communications.—Transport networks (miles, 1962): railways, 713; roads, 4,584, of which 200 are paved; navigable waterways: 1,865. National airline: Corporación Paraguaya de Transportes Aéros; the principal airport is at Asunción, served by 7 foreign airlines. Other communications data, 1959: passenger cars, 5,800; commercial vehicles, 2,500; telephones, 9,883 (1961); radio stations, 9; radio sets, 105,000. The small state-owned merchant fleet carries 6% of Paraguay's total river traffic, with Argentinian craft carrying the remainder.

Economy.—Gross national product, 1960: 25,035 million guaraníes (23,284 million Gs. in 1959). Cost-of-living index (1953 = 100): 331 in June 1961. Unemployed and those with no job classification make up 16% of the total population.

Agriculture, animal husbandry, and forestry account for about 50% of the national income. About 2.5 million acres (1% of the arable land) are under cultivation; cattle grazing occupies 40 million acres, and forests cover 54 million acres. Chief crops (metric tons, 1961): manioc, 994,000 (978,000 in 1960); corn, 110,000 (143,000); sugarcane, 646,700 (609,000); peanuts, 9,000 (8,500); tobacco, 8,500 (9,500); cotton, 24,500 (14,000); rice, 16,000 (15,400). Chief industrial products (metric tons, 1960): meat (tinned), 15,800 (11,965 in 1959); quebracho extract, 30,100 (30,100); cotton textiles, 1,100 (2,700); and sugar, 30,000 in 1961.

Foreign Trade.—Total exports, 1961: $30.68 million; imports, $34.73 million. Principal exports in millions of U.S. dollars, 1961: lumber, 6.45 (5.03 in 1960); meat, 8.63 (7.14); cotton, 1.6 (0.3); quebracho, 2.65 (2.95); hides, 2.01 (2.2); oilseeds, 1.9 (1.54); tobacco, 1.53 (1.59). Principal imports: foodstuffs, vehicles, machinery, and petroleum products. Principal customers: Argentina, United States, and Great Britain. Principal suppliers: United States, West Germany, and Argentina.

Events, 1962.—The major barrier to President Alfredo Stroessner's bid for a third term was removed when his Colorado Party-controlled Congress, over the strenuous protest of opposition forces, interpreted the constitutional ban on more than two terms to mean two full terms. (He came to power in 1954 through a coup and filled the unexpired term of his predecessor.) The elections were scheduled to be held Feb. 10, 1963. Although the president declared that the elections would be completely free, the opposition parties announced they would not participate unless the government lifted its 8-year-old state of siege, thus restoring constitutional liberties, and proclaimed a general amnesty for all political exiles. President Stroessner refused the request, asserting that the parties had only themselves to blame since their papers were irresponsible and subversive, their leaders were linked to communism, and their members were participating in anti-government guerrilla activities. These charges were denied by opposition leaders. The principal opposition parties are the Liberal and the Febrerista, both of which have splinter groups. A Christian Democracy Movement composed of intellectuals, university personnel, and professionals was organized during the year.

About 1,000 Paraguayan exiles in Uruguay signed a Liberal Party petition asking the Organization of American States to convene in Paraguay its Committee on Human Rights to investigate the abuses of the Stroessner regime. An abortive military coup in May resulted in the arrest of several Liberal leaders. Further unrest flared in May when students were arrested for stoning the home of the president of the National University (who is also vice president of the Colorado Party) for being too pro-government. Students called a 24-hour strike in protest of the arrests. The disturbances gave the government an excuse for extending its state of siege for another 90 days.

The United States was criticized on several occasions during the year. Opposition elements

voiced resentment of United States financial and technical assistance to the regime as being contrary to the objectives of the Alliance for Progress, and they accused President Stroessner of taking credit for United States-financed roads and bridges in order to justify continued Colorado Party rule.

Labor received in 1962 a 15% increase in minimum wages, and mandatory contributions by labor and employers to social security were increased. The government established a Housing Institute to provide housing for low-income families. Highway construction was generally slowed down by dry weather, but work continued on the Trans-Chaco road (which will eventually link Asunción with La Paz, Bolivia) and on roads connecting Paraguay with Brazil. The Brazilian government resumed work on the International Bridge between Paraguay and Brazil after a year's delay. The Inter-American Development Bank extended a loan of $800,000 to assist in relocating 2,500 families on a 250,000-acre tract of land in Alto Paraná; West Germany granted a $3 million loan for the development of the export industry; and the United States and Paraguay agreed to spend $3 million each under the Alliance for Progress for the construction of schools. Paraguay received $16.3 million in Alliance funds from March 1961 to February 1962.

A new $8.5 million hotel was opened in Asunción on the occasion of the visit of Prince Philip of Great Britain in March.

Assistant Professor of Political Science, The Ohio State University.

PARKS, National. See National Parks and Monuments.

PEACE CORPS

On March 1, 1961, President John F. Kennedy signed Executive Order 10924 creating the Peace Corps. On Sept. 21, 1961, Congress passed the Peace Corps Act (signed by the president on September 22), appropriating $30 million for the fiscal year 1962. The Peace Corps requested $63,750,000 for fiscal 1963.

By October 1962, there were 2,929 Peace Corps Volunteers serving 38 countries throughout Asia, Africa, and Latin America. Plans called for 5,000 volunteers to be in training or overseas in 42 countries by the end of 1962. Another 5,000 volunteers were scheduled to enter training and be sent overseas in 1963. There are no volunteers serving in any country which has not specifically requested their presence.

COUNTRIES SERVED BY THE PEACE CORPS
(As of October 1962)

Country	Volunteers	Project	Arrival Date
Afghanistan	9	multipurpose	Sept. 1962
Bolivia	36	health; sanitation	June 1962
Brazil	43	agriculture	March 1962
British Honduras	33	education	Aug. 1962
Cameroons	40	education	Sept. 1962
Ceylon	39	education	Sept. 1962
Chile	45	rural development	Oct. 1961
Colombia	100	rural development	Sept. 1961
Cyprus	22	rural development	Sept. 1962
Dominican Republic	21	rural development	June 1962
Ecuador	67	rural-urban development; education	Aug. 1962
El Salvador	24	agriculture	May 1962
Ethiopia	275	education	Sept. 1962
Ghana	119	education	Aug. 1961
Honduras	27	health; social work	Oct. 1962
India	76	agriculture; educ.	Dec. 1961
Ivory Coast	31	education	Sept. 1962
Iran	43	education	Sept. 1962
Jamaica	38	education	June 1962
Liberia	90	education	Aug. 1962
Malaya	115	multipurpose	Sept. 1962
Nepal	70	education; agriculture	Sept. 1962
Niger	7	education	Sept. 1962
Nigeria	189	education	Sept. 1961
N. Borneo, Sarawak	60	multipurpose	Aug. 1962
Pakistan	121	multipurpose	Nov. 1961
Peru	143	multipurpose	Sept. 1962
Philippines	537	education	Dec. 1961
St. Lucia	15	agriculture; health	Sept. 1961
Senegal	5	education	Sept. 1962
Sierra Leone	93	education	Jan. 1962
Somalia	45	education	July 1962
Tanganyika	62	public works; health	Sept. 1961
Thailand	99	education; health	Jan. 1962
Togo	18	education	Sept. 1962
Tunisia	66	public works; education	Aug. 1962
Turkey	32	education	Sept. 1962
Venezuela	68	multipurpose	June 1962

A Peace Corps volunteer instructs a citizen of Tanganyika in the use of surveying instruments at Dar-es-Salaam.

JOHN MOSS FROM BLACK STAR

The cost per volunteer per year is $9,000. The minimum age limit is 18, and there is no maximum. Length of service is two years. Married couples are eligible if both qualify and they have no dependents under 18. Volunteers receive a terminal allowance of $75 for each month of satisfactory service. An average of 12 weeks is spent in training for assignments. Two camps have been set up in Puerto Rico to introduce volunteers to community development activities and to improve their physical status.

PEDIATRICS

The special nature of the developing embryo and young infant has been emphasized during 1962 by instances of their great susceptibility to such drugs as thalidomide and such agents as quantities of salt. The study of the normal physiology of infants during this period and their peculiar susceptibilities has given rise to a new category of research workers particularly concerned with this period of life.

Thalidomide.—The tragedy in which thousands of babies were deformed by the drug thalidomide has focused attention on the problem of special drug effects on developing and newborn babies. Thalidomide is a sedative drug, the safety of which had been demonstrated in adults. Several months after its release for general use, it became apparent that some mothers using the drug in the seventh to eighth week of pregnancy later gave birth to infants with severe limb deformities. The drug resulted in the birth of an estimated 7,000–14,000 deformed children, mostly in Germany and England. This experience resulted in immediate tightening of legislation in the United States to remove potentially harmful drugs from the market, and it pointed to the need for testing drugs for toxic effects in pregnant and in newborn animals before the drugs are released for general use.

Thalidomide's effect classified it as a teratogen, a substance which can alter a developing embryo and lead to malformations. This drug has unique specificity in its effect on the limbs; effects on other organs have not been noted. It has been difficult to produce experimentally any effects on laboratory progeny when the drug is given to pregnant females.

Newborn Susceptibility.—Pediatricians have learned, particularly in the last decade, of many compounds that are safe in adults and older children but are harmful to newborn infants. Among these are such seemingly harmless agents as oxygen, which can cause blindness (retrolental fibroplasia) when given in excessive amounts to premature infants in incubators; vitamin K, which increases the hazard of kernicterus (a form of brain damage) in newborn babies prone to jaundice from blood incompatibility; and chloramphenicol, which can cause a shocklike state known as the gray syndrome in some babies in the first week of life. These and other agents may be required by newborn infants, but they must be given with caution because the newborn infant is susceptible to harm where older children and adults are not.

Another example of this peculiar susceptibility received national recognition in March 1962 when infants in the Binghamton (N.Y.) General Hospital were mistakenly given salt instead of sugar in their formulas. The salt, instead of inducing vomiting or rejection as it would in an older infant, was retained and led to death in the newborn infants. Because of the tolerance of their stomachs and the immaturity of their brains and kidneys in coping with the effects of the extra salt, six babies died.

Lung Surfactant.—Recent reports of research on the newborn have been concerned with the finding of special cells in the lung which secrete a substance that is essential to the normal expansion of the lung. This substance, called a surfactant, or surface-active agent, assures the lungs an even expansion with inhalation. A relationship between the production or failure in production of this compound and respiratory distress in the newborn[1] is not known but investigation is in progress. (See also Respiratory Diseases.)

Pediatric Trends.—The changing nature of medicine as it applies to children was evident in the symposia scheduled for the annual meeting of the American Academy of Pediatrics. The four principal symposia were concerned with the molecular physiology of the placenta through which the infant is nourished in the uterus; the impact of radiation and radioisotopes on children and research related to children; the physiology and sociology of obesity; and the yet unconquered pest of man, the common respiratory infection. Three of these problems concern the chemistry of living and emphasize the ever-increasing interest of medicine in basic chemistry and physics. One of these, the social implication of obesity, emphasizes the recognition of the role that sociological environment plays in determining the health and welfare of growing children.

Malcolm A. Holliday,
Associate Professor of Pediatrics,
University of Pittsburgh School of Medicine.

[1] Bucks County. [2] Delaware County.

Government.—Chief executive and judicial officers in 1962 were David L. Lawrence (Democrat), governor, serving a four-year term; John M. Davis, lieutenant governor; E. James Trimarchi, Jr., secretary of state; Grace M. Sloan, treasurer; Thomas A. Minehart, auditor; David Stahl, attorney general; Charles H. Boehm, superintendent of public instruction; and John C. Bell, chief justice of the 7-member Supreme Court.

The Pennsylvania General Assembly, which convenes annually, comprised 25 Democrats and 25 Republicans in the Senate in 1962 and 109 Democrats and 101 Republicans in the House of Representatives.

Legislation, 1962.—The second even-year session of the Pennsylvania General Assembly convened on January 2. (All regular sessions in even years are limited to consideration of revenue and appropriation measures.) Governor Lawrence submitted a budget calling for general fund and highway expenditures for the fiscal year ending May 31, 1963, of $1,497,939,941, of which approximately one third was for public education and one fifth for public welfare. The governor reported that the end of the fiscal year 1961–62 was expected to show a surplus of $8.9 million, and that no new taxes for fiscal 1962–63 would be necessary.

Owing to pressures for congressional reapportionment and redistricting, and for proposed amendments to the Pennsylvania constitution, Governor Lawrence issued an unusual call for a special session of the General Assembly for the week of January 22, to run concurrently with the regular session. During the special session the General Assembly redistricted the state for the 1962 election, reducing the number of congressional districts from 30 to 27 in accord with the reapportionment of House membership following the 1960 census.

The General Assembly also approved three resolutions to amend the state constitution. If approved by the next legislature and a statewide referendum, the first proposal would authorize a $70 million bond issue for state parks, reservoirs, and other public uses; the second proposal would change the time for the beginning of the terms of the state treasurer and the auditor general and permit them to hold office for two successive terms; and the third would reduce the residence requirement for voting from one year to 90 days.

Finance.—In the fiscal period June 1, 1961, to June 30, 1962, revenue of $2,549,245,625 included $1,650,518,256 from state taxes and $280,878,990 in federal

funds. Chief tax yields were the 4% general sales tax ($422,474,428) and taxes on corporate incomes ($284,192,004) and motor fuels ($239,450,167). Spending of $2,542,369,441 included $472,963,204 for education, $407,510,396 for health, welfare, and safety, and $427,293,566 for highways.

Education.—In the fall of 1962, public elementary schools staffed by 40,413 teachers enrolled 1,163,749 pupils; secondary schools with 37,422 teachers enrolled 895,662; and (fall 1961) private and parochial schools with 17,450 teachers enrolled 614,023. College enrollment (fall 1961) totaled 204,401 in 130 institutions, including 14 junior colleges and 116 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $886.4 million, including current expenditures of $815.4 million ($436.67 per pupil) and capital outlays of $22 million (an additional $130 million was derived from other sources). Revenue of $998 million was drawn chiefly from state funds ($423,712,000) and local districts ($496,788,000). Teachers' salaries averaged $5,470 (high school, $5,545; elementary, $5,433). Actual operating expenditures for higher education (1961 fiscal year) totaled $43,157,064.

Public Assistance.—In the fiscal period June 1, 1961, to June 30, 1962, public assistance payments to a monthly average of 429,274 persons totaled $206,939,098. This amount included $109,625,451 for dependent children and $40,583,199 for the aged.

Transportation and Communications.—With 437 miles of highway construction and reconstruction completed in the 1962 fiscal year, *highways and roads* on July 1, 1962, totaled 109,523 miles. These served 3,785,771 *motor vehicles* (as registered in July 1962), including 3,283,962 automobiles. Operating in the state in 1962 were 56 *railroads* (using, in 1961, 9,126 line miles of track); 16 regularly scheduled *airlines;* and 161 commercial and municipal *airports,* 16 heliports, 7 seaplane bases, and 1 helio-courier airport.

UPI

William Scranton, governor-elect of Pennsylvania, and his wife, Mary, appear at a victory celebration on the day after the November 6 election.

Communications media included (1961) 153 AM and 64 FM *radio stations;* 10 VHF and 11 UHF *television stations;* 120 *newspapers* (circulation, 4,200,802); and (Jan. 1, 1962) 1,285,500 business and 3,970,700 residential *telephones.*

Labor Force.—The state's labor force on June 15, 1962, included 143,500 agricultural workers. Nonagricultural employment stood at 4,205,200, compared with 4,151,600 for the previous June 15, and an average of 4,161,500 for the 12 intervening months. Of nonfarm employees, 33.5% were in manufacturing, 16.4% in trade, and 12.5% in service industries. Unemployment in mid-December 1962 totaled 383,000, an increase of 9,000 from the previous month, compared with 471,000 for mid-December 1961.

Manufacturing.—Manufacturing engaged an average of 1,369,508 persons in 1961 and provided a payroll of $6,926,969,600. Value added by manufacture amounted to $12,507,579,500.

Mining.—In 1961, Pennsylvania ranked fourth among the states in the value of its mineral output, with 4.37% of the national total. The value decreased 3% because of declines in the output of fuels and some major nonmetallic industries. The state was first in the production of cobalt and stone; second in cement, coal, and graphite; third in tripoli; and fourth in lime. Anthracite, bituminous coal, clay, sand and gravel, and stone declined drastically. Iron ore, portland cement, and lime were the only major industries to increase.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $592,722,000, compared with $594,678,000 for the corresponding period of 1961. For the full year 1961, income comprised $582,600,000 from livestock, $210,747,000 from crops, and $18,798,000 in government payments. Principal income sources in 1961 were wholesale milk, $303,968,000; eggs, $107,697,000; cattle, $89,171,000; and greenhouse and nursery products, $66,894,000.

The state's 100,000 farms in 1959 had an acreage of 11,862,000 (4,854,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 1,971,000 cattle, 483,000 hogs, and 19,133,000 chickens, and (1961) 38,849,000 commercial broilers. An average of 152,000 family and 33,000 hired workers engaged in farming in 1961.

LEADING PENNSYLVANIA MANUFACTURES, 1961

Industry group	Average no. of employees	Salaries and wages (in thousands)	Value added by mfr.[1] (in thousands)
Primary metals	208,214	$1,367,194	$2,277,122

Oats (1,000 bu.)	28,926	29,140	25,542
Peaches (1,000 bu.)	2,666	2,400	2,700
Potatoes (1,000 cwt.)	8,133	8,241	7,148
Tobacco (1,000 lb.)	47,357	53,475	52,700
Tomatoes (1,000 cwt.)	328	396	408
Wheat (1,000 bu.)	17,184	15,720	12,628

(Source: U.S. Department of Agriculture.)

Events, 1962.—Of most interest in Pennsylvania in 1962 was the election of U.S. Rep. William W. Scranton as the first Republican governor of the state in eight years. Representative Scranton defeated the Democratic candidate for governor, former Mayor Richardson Dilworth of Philadelphia, by a margin of 486,291 votes. Democratic Sen. Joseph S. Clark, however, was reelected over his Republican opponent, U.S. Rep. James E. Van Zandt, by 103,734 votes. The only other Democrat to win a statewide contest was incumbent Secretary of Internal Affairs Genevieve Blatt, who defeated her Republican opponent, Audrey R. Kelly, by the paper-thin margin of 1,200 votes. The newly elected governor appointed his campaign manager, Walter E. Alessandroni, as attorney general.

After years of controversy and conflict over the use of the waters and resources of the Delaware River Basin, an interstate compact was consummated by Pennsylvania, New York, New Jersey, and Delaware, and was put into effect in 1962 after approval by Congress and the president. Governor Lawrence was chosen as the first chairman of the Delaware River Basin Commission, the agency created to administer the compact. Other members of the commission are the governors of New York, New Jersey, and Delaware, and the United States secretary of the interior. James F. Wright, formerly chief deputy of the California Department of Water Resources, was named executive director of the Delaware River Basin Commission, as of April 16.

The Allegheny Reservoir (more commonly known as the Kinzua Dam), which will cover 21,175 acres, was under construction in Warren County. When completed, it will be the largest man-made body of water in the East. On September 15, embittered Iroquois Indians gathered along the Allegheny River to protest the project, which would take away the land forever pledged to them by the United States in the Treaty of 1794.

At Valley Forge, the General Electric Company completed a $32 million space technology center, one of the world's largest and best-equipped facilities for research and space programs. A new $13.5 million hospital for the mentally ill was dedicated by Governor Lawrence in Haverford Township, Delaware County, on September 12.

Nineteen persons were killed and 116 injured on July 28 in the derailment of a Pennsylvania Railroad excursion train near Harrisburg. Three of the cars plunged down an embankment into the Susquehanna River. An explosion December 6 at the U.S. Steel Corporation's Robena No. 3 mine, near Carmichaels, trapped and killed 37 men. As the state opened a public hearing into the disaster on Jan. 3, 1963, some 600 miners refused to work at Robena until the conclusion of the inquiry and the adoption of safety measures to prevent future accidents.

PERU

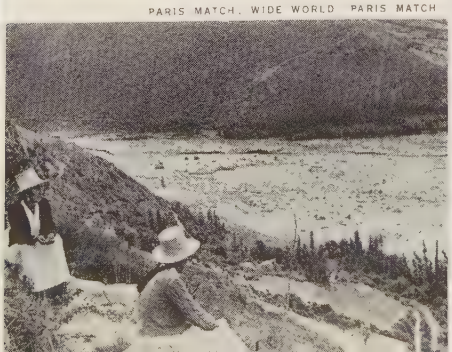
Exceeded in size in South America only by Brazil and Argentina, the Republic of Peru is bounded by Ecuador and Colombia on the north, by Brazil and Bolivia on the east, by Chile on the south, and by the Pacific Ocean on the west. It has an estimated area of 514,059 square miles and a population (1961 census) of 10,364,620. Lima, the capital, has a metropolitan population (1961 census) of 1,729,982. Other leading cities with populations (Dec. 31, 1958 est.) include Arequipa (121,896), Callao (129,365), Chiclayo (54,390), Cuzco (68,483), Huancayo (47,486), Iquitos (54,286), and Trujillo (60,427). Official estimates of ethnic distribution are: white and mestizo, 53%; Indian, 46%; and Asian (mainly Japanese) and Negro, 1%. Although the official language is Spanish, it is estimated that about 51% of the people speak the Indian languages, Quechua or Aymará.

Government.—Under the amended 1933 constitution, Peru is a unitary republic with a semiparliamentary system of government. The president (Manuel Prado y Ugarteche, elected June 17, 1956) is elected for a 6-year term and cannot be re-elected until the succeeding presidential period has passed. The cabinet (usually 12 members) is headed by a prime minister and is accountable to the Chamber of Deputies of 186 members and the Senate of 55 (all elected by direct suffrage for 6 years). There are two vice presidents elected by direct suffrage, and a judiciary headed by a Supreme Court of 16 members elected by the Congress. Voting is obligatory for all literate citizens between 21 and 60 years of age, and voluntary for all citizens over 60.

On July 18, 1962, the armed forces overthrew President Prado following the elections of June 10 (see below, *Events, 1962*). A military junta was formed with Maj. Gen.

An avalanche in the Peruvian Andes on January 10 destroyed several villages and killed about 3,500 persons. (*Left*) Refugees await transportation to aid stations in Lima. (*Center*) Survivors gaze at a sea of mud and rock covering a valley in which a village was buried. (*Right*) A mother and child are given food and shelter in the town of Hungay.

PARIS MATCH. WIDE WORLD PARIS MATCH



Ricardo Pérez Godoy at its head. In September, the junta decreed a new electoral law to govern the scheduled elections of June 9, 1963. Under the new statute, parties must present a petition signed by a minimum of 60,000 voters. Senators (47) will be elected by the departments and deputies (104) by electoral districts.

Education and Religion.—All recent governments have seen the need to improve and expand educational facilities. In 1962 public education was allocated 20% of the total budget. Although schooling is free and compulsory for children between the ages of 7 and 16, only 39% of the school-age population attends school. More than 50% of the population over the age of 10 is illiterate. In 1959 there were 14,102 primary schools, with 1,391,952 pupils; secondary schools in 1958 numbered 441 and enrolled 122,221 students. In addition to the University of San Marcos, which has an enrollment of over 11,000, there are small public universities in Arequipa, Cuzco, and Trujillo, and a Roman Catholic university at Lima.

The constitution declares that "the state protects the Apostolic Roman Catholic religion," but freedom of worship is legally guaranteed. The Catholic Church enjoys maximum influence in social, economic, and political affairs.

Finance.—The budget for 1962 was balanced at 11,291 million soles (26.81 soles equal U.S.$1), compared with 9,890 million soles in 1961. Since the end of World War II, Peru has experimented with various financial policies. An effort was made to achieve prosperity through price controls, government regulations and subsidies, deficit financing, and printing more paper money. The major consequences of these measures were inflation and a retardation of growth. The government reversed these policies in 1959 and endeavored to free the economy from governmental intervention and controls. In the first half of 1962, Peru's financial condition continued to be characterized by an overall balance in international accounts, steadiness in foreign exchange rates, a surplus in the government budget, and moderate credit and monetary expansion. From March 3, 1961, to July 1962, the United States authorized nearly $90 million in Alliance for Progress aid to Peru.

Transportation and Communications.—Inadequate transportation and communication facilities have impeded economic development in Peru. The railroad system (2,262 miles) is made up of a number of nonintegrated lines that provide service mainly between the coast and the population centers of the Sierra. Of some 18,600 miles of roads, only 11,700 are classified as improved, and only 1,700 miles are paved. In 1960 there were 79,800 passenger cars and 64,000 commercial vehicles.

The government owns a shipping line (Compañía Peruana de Vapores) which transports about 90% of the total cargo carried in Peruvian ships, and accounts for about 60% of the Peruvian merchant marine (136,000 gross registered tons in 1961). Expansion of the Callao port, which handles 75% of Peru's imports, was initiated on June 1, 1962, with the signature of a $4.2 million contract for the construction of ore- and petroleum-handling additions. The Lima-Callao International Airport is served by Aerolinas Peruanas and Compañía de Aviación Faucett, and by 12 foreign airlines.

About 75% of Peru's 108,657 telephones (1960) are located in Lima. The government operates the domestic telegraph system, which was slated for a $21 million expansion and reorganization program beginning in 1962. There are 40 radio broadcasting stations and some 820,000 radio receivers (1959), and 5 television stations and 75,000 television sets (1962).

Manufactures and Minerals.—About 17% of the labor force is engaged in industrial activities, which account for about 18% of the gross national product (an estimated $2.2 billion in 1962). Manufacturing industries are devoted principally to the production of consumer goods for domestic consumption—food, tobacco, rubber, leather, metals, paper, textiles, and chemicals. There are also shipbuilding and construction industries.

With the emphasis on private enterprise, industrial production increased 80% from 1950 to 1959. In 1960 and 1961, 740 new firms were established, with an investment of 834 million soles leading to the creation of 15,000 new jobs. A decree of May 2, 1962, authorized the expansion of the government-owned Santa Corporation steel plant at Chimbote from 60,000 metric tons annually to 350,000 tons of finished steel products, with an eventual increase to a 600,000-ton capacity. The project, costing an estimated $130.5 million, is to be carried out by a consortium of West German firms, with machinery and installations to be supplied by Germany, France, and Belgium.

In 1961, mining accounted for 15% of real national income. Between 1958 and 1961, mining revenue increased by 41.5%, due mainly to increased copper and iron production. Principal minerals (metric tons, 1961): petroleum, 2,592,000; copper ore, 196,800; iron ore, 5,376,000; lead, 76,080; zinc, 32,280.

Agriculture.—Peru's principal economic activities are agriculture and forestry, which employ about 62% of the population. Agriculture earned 23% of the national income in 1961. However, with only about 4.7 million acres under cultivation (out of about 27 million acres available), Peru must import foodstuffs each year. Cotton is the country's most important crop; estimated production in 1962 was 600,000 bales. Sugar production for 1962 was estimated to be 4–5% above the 1961 yield of 893,000 tons. Agricultural production for internal consumption includes wheat, corn, barley, and rice.

Favored by the Peru Current, the nation is rapidly developing its fisheries. Fishmeal production increased from 12,100 metric tons in 1953 to 520,000 metric tons in 1960, making Peru the world's primary fishmeal producer.

Foreign Trade.—Total exports, 1961: 13,248 million soles (11,725 million in 1960); imports, 12,550 million (10,168 million). Principal exports (in million soles, 1961): fishmeal, 1,329 (1,338 for all fish products in 1960); cotton, 2,140 (1,997); sugar, 1,721 (1,299); copper, 2,808 (2,580); iron ore, 909 (1960). Principal imports include machinery and vehicles, foodstuffs, tobacco, metals, chemicals, and textiles. The United States accounts for about 40% of Peru's total trade.

Events, 1962.—On January 10, the Andean village of Ranrahirca and surrounding communities near Mt. Huscarán were buried in an avalanche of ice, boulders, and mud, resulting in between 3,500 and 3,800 deaths.

Nearly 1.7 million voters out of the 2.2 million registered voted in the elections of June 10. The results for president were: Víctor Raúl Haya de la Torre of the American Popular Revolutionary Alliance (APRA), 557,524 (32.97% of the total vote); Fernando Belaunde Terry of the Popular Action Party, 543,322 (32.13%); and Manuel A. Odría of the Odría National Union, 481,039 (28.45%). Four other candidates participated in the election but received little support. The new Congress consisted of 114 APRA members, 78 representing the Popular Action Party, 42 from the Odría National Union, and 7 others.

As the constitution provides that a winning presidential candidate must obtain "not less than one third of the valid votes," and since no candidate received the required percentage, the newly elected Congress was entrusted with the task of selecting a president from among the three candidates with the largest number of votes. However, no single party held sufficient seats to elect a president.

Before the new Congress could convene, the armed forces on July 18 deposed President Manuel Prado y Ugarteche and annulled the elections on the grounds of alleged electoral irregularities. The armed forces formed a junta of four officers, each of whom assumed in turn the title of president. On July 24, Maj. Gen. Ricardo Pérez Godoy assumed the traditional powers of the presidency "as the junta member who has been longest in military service."

The United States suspended diplomatic relations with Peru within hours of the coup d'état of July 18, and cut off all economic and military aid. However, as the junta governed without recourse to terror and promised democratic elections, the United States resumed diplomatic relations on August 17, and on October 12 resumed military aid. On Jan. 5, 1963, the junta proclaimed a nationwide state of siege to break up what it called a revolutionary plot planned in Moscow and Havana.

PETROLEUM

The petroleum industry appeared to be passing through a transitional period in 1962, although it was still suffering from the effects of an excess of supply over demand. World proved reserves increased. Production expanded at a higher rate, and the search for oil spread to new areas. The continued emphasis on operating efficiency was re-

flected in an overall improvement in the financial outlook despite generally depressed prices.

Production.—World production of crude petroleum rose from an average of 22,556,300 barrels daily in 1961 to 24,298,000 barrels daily in 1962, or 7.7%. In the Eastern Hemisphere output increased by 1,149,500 barrels daily, as compared with 592,200 barrels in the Western Hemisphere. The output of Algeria, in what was formerly the French Saharan departments, increased by 29.9%,

[1] Final. [2] Preliminary. [3] Because of the use of several sources for data on the USSR and its satellites, the figures given for the individual countries for 1960 and 1961 do not add up to the totals for the group. [4] Formerly listed as Saharan departments. (Sources: U.S. Bureau of Mines and *World Petroleum*.)

to 438,000 barrels daily. Two new pipelines, completed in 1961 and 1962, carried crude oil from recently discovered fields in Libya to tanker terminals on the Mediterranean Sea, and the country's production averaged about 234,000 barrels daily.

In the Middle East production rose by an average of 584,000 barrels daily. Of this increase, 35.2% came from Kuwait, 22.2% from Iran, and 20.9% from Saudi Arabia. The first shipments were made from a new offshore oilfield at Abu Dhabi in Trucial Oman. Of the Communist countries, only the USSR raised crude production materially, by an average of 340,500 barrels daily, or 10.3%. It remained the world's second largest producing nation, supplying 3,645,000 barrels daily, or 15% of the 1962 total.

In the Western Hemisphere, Canadian production continued to increase in 1962, rising by 12.2%, to 677,700 barrels daily. The output of the United States showed about the same rate of growth as in 1961, or 2.1%, reaching an average of 7,331,000 barrels daily. A presidential proclamation of November 30 tightened restrictions on oil imports east of the Rocky Mountains. During the year, Argentina and Venezuela registered substantial gains of 13.8% and 9.8%, respectively, and renewed activity halted the decline of production in Colombia.

Although fewer rigs were operating throughout the world in 1962, exploration generally continued at a high level and extended into many new areas. Of especial interest was the first commercially significant discovery of oil in Australia, at Moonie, Queensland. The world's proved reserves of crude oil rose by 4.3%, or 11,440 million barrels, during 1961, to reach a level of about 277,120 million. The Middle East, particularly offshore discoveries in the Persian Gulf, accounted for most of the increase. In the United States a downward trend was reversed as crude reserves rose by 145.3 million barrels, to 31,758.5 million.

[1] Revised. [2] Arizona, Missouri, Nevada, South Dakota, Tennessee, Washington, and Virginia. [3] Includes some field condensate. (Source: U.S. Bureau of Mines.)

Consumption.—World demand for crude oil and for liquid hydrocarbons derived from natural gas increased by 6.3% in 1962, to about 24,463,000 barrels daily. Consumption in the Western Hemisphere rose by 4.4%, and in the Eastern Hemisphere by 9.5%. A general improvement in the

economy of North America helped to raise the rate of growth, particularly in the United States, where demand increased by about 4%, as compared with 1.4% in 1961. Canada's consumption showed a more modest gain of 3.1%, as compared with over 7% in the previous year.

The growth in the volume of demand in western Europe and the Far East continued strong in 1962, although rates of increase declined as a natural consequence of the attainment of larger bases. Japan remained the fastest-growing nation in oil consumption. By 1963 it will quite likely reach a daily consumption level of 1,000,000 barrels, becoming the fourth-ranking nation, after the United States, the USSR, and Great Britain.

Perhaps the most significant effect of consumption trends on the international movement of oil was the rapid rise of exports from North Africa, almost all of which were shipped to Europe. These exports increased to 435,000 barrels daily in 1961, or about 84% above the 1960 level. Exports from Soviet bloc nations rose by nearly 40%, to 615,000 barrels daily, about two thirds of which were shipped to western European nations. As a result, the Middle East's share of the European market dropped from 69% in 1960 to 64% in 1961. At the same time, the North African portion of this trade rose from 6% to 9.6%.

Transportation.—Although the tanker construction industry continued in a slump in 1962 because of the worldwide surplus of vessels, a number of supertankers of 100,000 tons or more were still being built, and others were planned. Meanwhile, pipelines were being constructed at a high rate, with almost $5 billion worth of new lines planned or being laid. The Eastern Hemisphere accounted for more than $3 billion of the total, major lines being scheduled for western Europe and the USSR.

A fundamental change was taking place in the transportation pattern in western Europe and in the location of manufacturing to serve interior markets. Formerly, refiners had found it more profitable to build their plants on the coast, receive crude oil by ship, and move products inland by rail, highway, and canal or river barge. Now, with four major crude oil lines originating at Mediterranean and North Sea ports, Europe soon was expected to have a crude pumping capacity of about 700,000 barrels daily. Most of these lines were to feed into the rich industrial centers of West Germany. In the USSR the principal pipeline was a 1,000-mile system designed to bring crude oil from the Urals to the eastern European countries of the Soviet bloc in 1963.

The biggest project in the Western Hemisphere, and one of the largest single pipeline projects ever undertaken, was the $350 million products system being constructed between Houston, Texas, and New York. Comprising a 1,600-mile main line and 1,000 miles of branches, it was scheduled for completion in 1963.

Refining.—World crude oil refining capacity increased by about 5%, to an average of almost 26 million barrels daily, during 1962. Growth in the Eastern Hemisphere, where capacity rose by 978,500 barrels daily, or 9.2%, continued to be much larger than that of the Western Hemisphere, in which capacity grew by 284,000 barrels, or 2%. By the end of the year there were 638 refineries in the free world.

Natural Gas.—As of the end of 1961 world reserves of natural gas were estimated at 721,450 billion cubic feet, of which the United States had 38%, the Middle East nearly 25%, the USSR 10.4%, and Africa 7.5%. The proximity of rich North African fields, especially those of Algeria, has resulted in a major project to move this gas, in liquefied form in tankers, to Great Britain. Within a few years, however, the huge gas deposits discovered in 1962 in the Netherlands might command a major share of the European market.

PHILADELPHIA

The nation's fourth largest city, with a population of 2,002,512 (1960 census), Philadelphia, Pa., is the central city of a rapidly growing eight-county metropolitan area of 3,549 square miles and a population in 1960 of 4,342,897.

Philadelphia completed its 10th year under home rule charter in January 1962. The charter provides for a modified "strong mayor" plan with a mayor and a City Council of 17 members, all elected for four-year terms. In accordance with the charter, the mayor appoints and may remove a managing director who assumes much of the day-to-day responsibility for administration through his (the managing director's) power to appoint, remove, and supervise the activities of the 10 most important "line" departments.

A record general fund budget of $259,104,000 was submitted to the City Council for 1963, but no new taxes were deemed necessary. The Philadelphia Board of Education also proposed a record budget of $118,770,307 for 1963 without recommending additional taxes. City public school enrollment as of Oct. 1, 1962, was 256,555.

Building permits issued in the first 10 months of 1962 totaled $152,207,393 (up 3% from the same period of 1961). Unemployment in the Philadelphia metropolitan area for the first half of 1962 was down 14.5% from the same period of 1961; bank debits were up 14.5%; department store sales were up 5%; and exports for the full year 1961 were up 25.5% over 1960. Total cargo shipped through the port in 1961: imports, 40,481,353 short tons; exports, 3,400,306 short tons.

In the November 1962 election, limited primarily to the choice of state officials and members of Congress, the voters of Philadelphia elected one Democratic councilman-at-large and one Democratic and one Republican district councilman—all three to fill vacancies. As of December 1962, the Democratic Party had 13 of the 17 members on the City Council, the Republicans had 3 members, and 1 seat was vacant.

Philadelphia lost one of its six congressional seats as a result of reapportionment and redistricting, and in the November election all five seats were retained by Democrats. All statewide Democratic candidates carried Philadelphia, but only Sen. Joseph S. Clark and Secretary of Internal Affairs Genevieve Blatt were successful in the state. Three loan proposals, covering a wide range of capital improvements in the city and totaling $37,480,000, were approved by both political parties prior to the election and were supported by overwhelming majorities of the voters.

One of the most important events of 1962 in Philadelphia was the resignation in February of Mayor Richardson Dilworth, who first won the Democratic nomination for governor in the spring primary but then lost the November election to his Republican opponent, Congressman William W. Scranton, by a majority of more than 470,000 votes. Mayor Dilworth was succeeded by Council President James H. J. Tate, also a Democrat, who is to serve as acting mayor until January 1964.

An event of historical importance to Philadelphia and the nation was the city's year-long celebration of the 175th anniversary of the birth of the United States Constitution. There were special festivities on July 4 and on Constitution Day, September 17, when rehabilitated Congress Hall was dedicated.

A badly needed new police administration building was completed in 1962 and made ready for occupancy on November 1. The new eight-

story Charles Patterson Van Pelt Library of the University of Pennsylvania, with a capacity of 1,500,000 volumes, was dedicated on October 22, and the $1,300,000 Annenberg Communications Center on the University of Pennsylvania campus was dedicated on November 8.

For the third time in the past nine years, the City of Philadelphia received the Grand Award of the National Fire Protection Association as "the Nation's leading city in the field of fire prevention, education, and promotion."

A disastrous fire—described as the worst in the city's history—swept through a section of North Philadelphia on Jan. 1, 1963, razing a nine-story warehouse, destroying about 40 homes, and disrupting commuter service on the Reading Company's main-line tracks. A 10-block neighborhood affected by the conflagration was declared a disaster area by the federal government.

JEWELL CASS PHILLIPS,
Professor of Political Science,
University of Pennsylvania.

PHILANTHROPY

The most recent estimates for total private philanthropy in the United States are based mainly on federal tax returns for 1958. The value of gifts in that year has been estimated at between $8 and $10 billion. A projection of the rising trend in giving suggests that by 1962 contributions may have reached $10 to $12 billion.

About 80% of the 1958 amount came from living persons, 7% from charitable bequests, 6% from foundations, 5% from corporations, and 2% from the endowment earnings of educational, health, welfare, and religious organizations. If these latter organizations were required to pay rent on their libraries, laboratories, hospitals, churches, and other buildings made possible by earlier gifts, they probably would have to spend an additional $1 billion a year; so this unseen income is also an important part of present philanthropic support.

Since the summer of 1961, philanthropic foundations have been under the scrutiny of Congressman Wright Patman of Texas. He obtained information on the 1951–60 assets, income, and expenditures of 524 foundations, accounting for about nine tenths of all foundation assets in the United States. Detailed statistical tables were published in the July 23 and Aug. 20, 1962, issues of the *Congressional Record,* and more were expected.

In 1959, corporate contributions reported on tax returns exceeded by over $60 million the amount contributed in any year except 1953, when taxes on excess profits caused many companies to establish and endow foundations. The $482 million reported in the normal tax year of 1959 reflects the apparently continuing upward trend in corporate giving since the 1930's. Part of the rise is due to the increase in corporate income, from which gifts may be made and deducted up to 5% of net income for tax purposes. However, the percentage of income given has also risen. Tax deductibility explains part of this rise, because a corporation can give much more for the same net after-tax cost than it could in the 1930's when tax rates were much lower. However, even after allowing for the rise in corporate incomes and the rise in income tax rates, an increase in giving has been detected.

A 1961 study by the Boston Fund reported that the total endowment of 65 of the more highly endowed colleges and universities was $4.5 billion. The United States Office of Education has estimated that 1958 endowment earnings for all colleges and universities was about $182 million. By 1962 this figure had probably risen to close to $200 million.

Precise data on fields served by philanthropy in 1962 are not available. Rough estimates suggest that about 61 cents of the philanthropic dollar goes to religious organizations and church-supported private education, about 13 cents goes to higher education, about 22 cents to health and welfare not supported by religious organizations, and 4 cents to all other recipients, including cultural services, museums, libraries, and outright charity rackets. The year 1962 was notable for an intensification of interest in support of the arts by both government and private organizations. The Ford Foundation voted a substantial expansion in its arts program, and one of its acts was to award $6.1 million to nine regional nonprofit repertory theaters.

New estimates of the amount of giving to religious organizations have been made recently. For 1960 it has been estimated that religious organizations received about $5.4 billion in contributions: $3.6 billion to Protestant, $1.7 billion to Roman Catholic, $150 million to Jewish, and $50 million to other religious bodies. Of the total donated to Roman Catholic churches, about $700 million was applied to cover the operation of churches and about $1 billion to support their extensive primary and secondary school systems.

Director, Foundation Investments Study,
Foundation Library Center.

PHILATELY

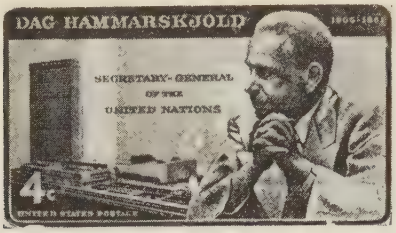
Manned conquest of space was a major theme of stamps issued in 1962, although issues commemorating the emergence of independent nations also attracted philatelic interest. An error of inversion on a United States stamp created a sensation when it was discovered and a great furor when Postmaster General J. Edward Day ordered 10 million of the errors printed to deflate their potentially high rarity value.

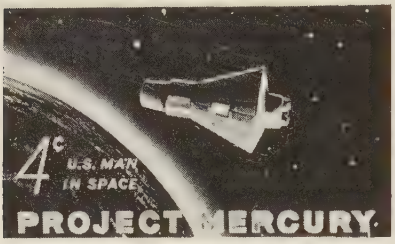
The error, consisting of the inversion of a yellow panel on the commemorative stamp released October 23 honoring the late UN Secretary General Dag Hammarskjöld, was found by several collectors, one complete pane of 50 being held by a New Jersey collector. His threatened court test of Mr. Day's authority to reprint the error was halted when postal officials authenticated his "discovery" pane. Court action delayed a Canal Zone decision to deliberately reprint a misprinted stamp, when a stamp supplier had found the bridge missing in a pane of 50 of the stamps issued for the opening on October 12 of the Thatcher Ferry Bridge spanning the Panama Canal.

Space Stamps.—The United States issued a stamp commemorating the feat on the very day, February 20, that Lt. Col. John H. Glenn, Jr., made three earth orbits in the *Friendship 7* capsule of the Project Mercury program. Within minutes after Glenn had been pulled safely aboard the destroyer *Noa* in the Atlantic, the stamp was on sale at more than 300 United States post offices. Some 300 million copies of this stamp were issued, as well as 3 million first-day covers canceled "Cape Canaveral, Fla.," the point from which the capsule had been launched.

On April 12, 1961, the Soviet Union had issued a stamp to mark the first manned orbital flight of Maj. Yuri Gagarin on that day. Soviet stamps also appeared on Aug. 15, 1962, the day of the successful landings of Maj. Andrian Nikolayev and Lt. Col. Pavel Popovich from their dual orbital flights.

The successful orbiting of the United States Telstar communication satellite on July 10 made possible television broadcasts between the United States and Europe, as well as transmission of news matter and photographs between the continents. France participated in the Telstar programs and was quick to issue stamps to signalize the event.





POST OFFICE DEPARTMENT; UPI

(Top) Misprints of the Dag Hammarskjöld commemorative stamp, in which one color plate was reversed, lost their value when the Post Office Department deliberately repeated the error and sold the misprints to the public. (Bottom) "Man in Space" stamp went on sale February 20, the day of John Glenn's flight.

Stamps of New States.—The states which became independent—not all of them new to philately—included the Republic of Rwanda and the Kingdom of Burundi, from the former United Nations trust territory of Ruanda-Urundi, administered by Belgium; and Jamaica, Cyprus, Algeria, Trinidad and Tobago, and Uganda. All issued stamps commemorating their new status.

U.S. Program.—Although congressional approval was not obtained to raise domestic postal rates in 1962, increases took place on Jan. 7, 1963—to 5 cents for surface mail and 8 cents for airmail. Values issued to accommodate to these new rates were a 5-cent blue stamp, carrying a reproduction of a 1785 bust of George Washington by the French sculptor, Jean Antoine Houdon, for first-class mail; an 8-cent red stamp for airmail; and a 4-cent postcard, 5-cent envelope, and 8-cent air-mail envelope.

The most unusual United States issue of 1962 was its first Christmas stamp, a regular 4-cent issue, with wreath, bow, and lighted candles in traditional red and green; the initial printing order of 500 million, the largest ever placed for a United States stamp, was increased to approximately 1 billion because of demand. Collectors also discovered a flaw in the printing—missing plate numbers, caused when the Bureau of Engraving and Printing had to use small sheets for printing the stamps, the original supply of larger sheets having been exhausted.

The 15-stamp commemorative program continued, all being of 4-cent denomination. They were as follows, with the place and date of first-day issue:

New Mexico Statehood, Santa Fe (January 6).
Arizona Statehood, Phoenix (February 14).
Project Mecury, at more than 300 cities (February 20).
Malaria Eradication, Washington, D.C. (March 30).
Battle of Shiloh, Civil War Centennial series, Pittsburg Landing, Tenn. (April 7).
Charles Evans Hughes, Washington, D.C. (April 11).
Seattle World's Fair, Seattle, Wash. (April 25).
Louisiana Statehood, New Orleans (April 30).
Homestead Act Centennial, Beatrice, Nebr. (May 20).
Girl Scouts of America, Burlington, Vt. (July 24).
Brien McMahon, Norwalk, Conn. (July 28).
Apprenticeship, Washington, D.C. (August 31).
Sam Rayburn, Bonham, Texas (September 16).
Dag Hammarskjöld, New York, N.Y. (October 23).
Higher Education, Washington, D.C. (November 14).
Winslow Homer's *Breezing Up*, Gloucester, Mass. (December 15).

DAVID LIDMAN,
Stamp News Editor, "The New York Times."

PHILIPPINES

The Republic of the Philippines, comprising about 7,100 islands and islets, lies north of Indonesia. It has a total area of 115,707 square miles. The largest islands are Luzon (40,420 square miles), Mindanao (36,537), Samar (5,050), Negros (4,905), Palawan (4,550), and Panay (4,446).

Population.—Total population: 27,455,799 (1960 census); 29,698,000 (mid-1962 est.). Most densely populated provinces (1960): Rizal (1,463,530), Cebu (1,340,439), Negros Occidental (1,332,017), Leyte (1,177,407), Cotabato (1,152,474), and Pangasinan (1,124,846). Principal cities (1960): Manila, the former capital (1,145,723); Quezon City, the new capital (397,374); Cebu City (259,194); Davao (231,833); Basilan City (156,046); and Iloilo (150,976).

Government.—The chief executive during 1962 was Diosdado P. Macapagal; the vice president and secretary of foreign affairs, Emmanuel Pelaez. The two men were elected on the Liberal Party ticket for 4-year terms on Nov. 14, 1961. There is a bicameral Congress, consisting of a Senate of 24 members elected at large for overlapping 6-year terms, and a 104-member House of Representatives chosen by congressional districts for 4-year terms.

Education and Religion.—Enrollment, 1960–61 school year: 5,239,604 (including 952,411 in private schools). The state-supported University of the Philippines had a 1961–62 enrollment of 35,334. English is the medium of instruction, but Tagalog, basis of the national language, is taught in all schools.

The constitution guarantees freedom of worship and permits religious instruction in the public schools. Religious affiliation (1948 census): Roman Catholic, 83%; Aglipayan (Philippine Independent Church), 8%; Muslim, 4%; Protestant, 2%; other, 3%.

Finance.—Government revenue (1961): 1,351 million pesos; expenditures, 1,184 million. National public debt: 1,579 million pesos in January 1961 (1,432 million, January 1960). Foreign exchange holdings of the Central Bank and commercial banks: $103.34 million at the end of 1961 ($192.06 million a year earlier).

Transportation and Communications.—Scheduled operations of Philippine railways in the first 11 months of 1961: 9,886,000 passengers and 1,046,000 tons of freight (Manila Railroad Company); 1,644,000 passengers and 190,000 tons of freight (Philippine Railway Company). Road mileage (June 30, 1960): 23,085 (national, 9,080; provincial, 12,011; city, 1,994). Philippine Air Lines scheduled operations (1961): 9,549,000 miles flown; 790,000 passengers carried; 26,546,000 pounds of freight.

Licensed radio stations (1960–61 fiscal year): 3,746; television stations, 4; registered motor vehicles, 173,399; periodical publications, 878 (combined circulation, 5,780,707). Telephones (1961): 113,440.

Economic Indicators.—Gross national product: 13,123 million pesos in 1961 (up 6.7% from 1960); national income, 11,518 million (up 6.8%). Index of industrial production (1958 = 100), 1961: metal mining, 114; manufacturing (excluding basic metal industry), 120. Cost-of-living index (1941 = 100) for low-income Manila families: 350.8 in 1961.

Manufactures and Minerals.—Value of manufactured products: 2,015 million pesos in 1961 (up 11% from 1960). Increases were registered by metal products and transport equipment, 52 million pesos; chemical products, 19 million; and petroleum and coal products, 50 million. Gross value of mineral production in 1961: 320.4 million pesos, including 423,000 fine ounces of gold, 1,170,000 metric tons of iron ore, 152,400 tons of coal, and 1,018,800 tons of cement. In 1961 the Manila Electric Company produced 1,937 million kw.-hr. of electricity.

Agriculture.—Gross value of agricultural production in 1961: 4,019 million pesos, to which palay (rough rice) contributed 39.3%; copra, 13.7%; sugarcane, 9.8%; corn, 8.8%; and root crops, 5.4%. Production of leading crops in 1961 (thousands of metric tons): rice, 3,992; corn, 1,228; sugar, 1,490; abacá, 90; tobacco, 60; sweet potatoes (1960), 738.

Foreign Trade.—Exports, 1961: 1,071 million pesos ($499.5 million); imports, 1,244 million ($611.3 million). Principal exports (in million pesos): sugar and sugar preparations, 281; logs and lumber, 194; oilseeds, oil nuts, and oil kernels, 192; metalliferous ores, 138; textile fibers, 63; fruits and vegetables, 53; vegetable oil and fats, 30.9; clothing, 30.4; wood manufactures, 23; and gold, 19.9. Principal imports: machinery, 201; transport equipment, 137; iron and steel, 103; petroleum and petroleum products, 98; textile yarn, thread, and cloth, 71; cereals, 56.8; textile fibers, 56.7; electrical machinery, 55; dairy products,

49; and paper and paper manufactures, 44. Leading trading partners and share of each in Philippine foreign trade (October–December 1961): United States, 51.1%; Japan, 20%; West Germany, 4.1%; Netherlands, 3.9%; Great Britain, 2.5%; and Indonesia, 1.4%.

Events, 1962.—President Macapagal, in his state-of-the-nation address at the opening session of the 5th Congress on Jan. 22, 1962, discussed the critical condition of the economy. He proposed adoption of an integrated five-year development program having for its objectives: "immediate restoration of economic stability; alleviation of the plight of the common man; establishment of a dynamic basis for future growth." As a step toward these goals, the president had ordered (effective January 22) the lifting of foreign exchange controls (except for 20% of the proceeds from exports and capital transfers). His action was designed to allow the peso to seek its true level and, at the same time, to remove what he called "a vital source of graft." As of October 1, the free selling rate of the peso was 3.90 to the U.S. dollar.

As a result of the 1961 elections, the Nacionalista Party retained control of both houses of Congress. On March 10, 1962, however, a new working majority made up of Liberals and a group of Nacionalistas gained control of the House of Representatives and proceeded to reorganize it. Daniel Z. Romualdez (Nacionalista) was ousted from the speakership, and Cornelio T. Villareal (Liberal) was elected to succeed him. Under the new leadership some important measures recommended by the president were approved. Among them were bills stabilizing the price of palay, rice, and corn; creating an emergency employment administration; providing for the construction of housing for the poor; and seeking to promote cottage industries.

President Macapagal's first year in office was marked by a vigorous campaign against graft and corruption. A major event of this campaign was the deportation of Harry S. Stonehill and Robert P. Brooks, American businessmen. In ordering their deportation on August 3, Macapagal stated that "their presence was an immediate and continuing menace to the peace, welfare and security of the country."

On several occasions during the year, President Macapagal reiterated the anti-Communist objectives of Philippine foreign policy. Speaking to the Manila Overseas Club on September 4, he said: "The Philippine policy toward communism is straightforward and unequivocal. We are inflexibly opposed to communism. . . . We have no relation with any Communist state, and we do not propose to have such relations in the foreseeable future."

The rejection by the U.S. House of Representatives on May 9 of an administration-sponsored bill for the payment of Philippine war damage claims had a temporarily adverse effect on Philippine-American relations. President Macapagal postponed a projected visit to the United States, and the date of the Philippine Independence Day was changed from July 4 to June 12, the anniversary of the proclamation of independence from Spain by Gen. Emilio Aguinaldo in 1898. A new bill, authorizing payment of $73 million in additional war damage compensation to Philippine claimants, was passed by the U.S. Congress on August 24. News of its approval by President John F. Kennedy on August 30 was received enthusiastically in the Philippines, where it was taken as fresh evidence of the existence of a reservoir of goodwill toward the Philippine people on the part of the United States.

On June 22, President Macapagal formally laid claim on behalf of the Philippine government to British North Borneo, which, he stated, a former sultan of Sulu had leased (rather than sold) to British subjects. "We take this step without any feeling of unfriendliness to the United Kingdom, but solely in the peaceful pursuit of our national interest." Later, on July 27, he suggested the substitution of a Confederation of Greater Malaya for the Federation of Malaysia being formed under British sponsorship.

Between June 29 and July 17, the president visited Spain, Italy, and Pakistan. As a result, he reported on his return, the Philippines "acquired a new look abroad and, in turn, won a new prestige abroad."

NICOLAS ZAFRA,
Professor of History (Retired), University of the Philippines.

PHILOSOPHY

Alexis de Tocqueville observed in the early 19th century that in no country in the civilized world was less attention paid to philosophy than in the United States. In 1962 the contrary might be claimed; for the United States in its maturity shows among the highest rates of philosophical interest in the world. This philosophical interest continues to grow at a rapid pace. In 1962 over 565 philosophy books were published (an increase of 18% over the previous year). Philosophy departments were reported in approximately 1,304 colleges and universities. Over 80 regional and national philosophical societies held meetings; and new groups, such as the Philosophical Society for the Philosophical Study of Dialectical Materialism, were established. Five new philosophical journals were added to the already impressive list: *The Monist; The Pacific Philosophy Forum; The International Philosophical Quarterly;* the Canadian *Dialogue*, and *Soviet Studies in Philosophy: A New Journal of Translation from Soviet Sources.*

American philosophy is diverse, but the primary bent is naturalistic, analytic, pragmatic, and positivistic. In the philosophy of science, Herbert Feigl and Grover Maxwell edited *Minnesota Studies in the Philosophy of Science,* vol. 3, *Scientific Explanation, Space, and Time;* and Ernest Nagel, Patrick Suppes, and Alfred Tarski edited *Logic, Methodology, and Philosophy of Science.* The frontier field of decision making has also been of considerable interest to technical philosophers. Russell L. Ackoff's *Scientific Method: Optimizing Applied Research Decisions* and C. West Churchman's *Prediction and Optimal Decision; Philosophical Issues of a Science of Values* (late 1961) were both concerned with the methods of effective decision making.

The influence of British analytic philosophy continued to be felt in the United States. Max Black, in *Models and Metaphors; Studies in Language and Philosophy,* used linguistic analysis to deal with problems of logic, causation, and induction. The posthumous works by the English ordinary-language philosopher J. L. Austin, *Philosophical Papers* (1961) and *Sense and Sensibilia,* were received with interest. Brand Blanshard, however, published in 1962 *Reason and Analysis,* a devastating critique of logical positivism and analytic philosophy, and a defense of rationalism.

In a sense the current analytic scene is still reacting to the positivistic verifiability principle which rejected emotive and metaphysical language as meaningless. Problems of meaning and semantics thus are central in present-day inquiry, as philosophers attempt to discover the different uses and functions of various kinds of sentences. A topic of some interest in this connection is the place of metaphors in aesthetics and metaphysics. Philip Wheelwright published *Metaphor and Re-*

ality, and Colin Turbayne, *The Myth of Metaphor.* The American Philosophical Association, Western Division, devoted a special meeting to this topic in May. Some analytic philosophers have turned their attention to religious discourse, claiming to have found a special kind of significance and use here. Among them are Paul F. Schmidt (*Religious Knowledge*) and Federick Ferré (*Language, Logic, and God*). Many American philosophers, however, have been skeptical of these analyses. In the symposium *Religious Experience and Truth* (late 1961), edited by Sidney Hook, there were critical discussions by some 30 writers of the claims of some modern theologians.

Since the early 1950's Asian philosophy, especially Zen Buddhism, has had an impact on the popular Western mind. D. T. Suzuki published another book in 1962, *The Essentials of Zen Buddhism.* That American philosophers have been rather dubious of the merits of such philosophizing was seen in Van Meter Ames' *Zen and American Thought* and Dale Riepe's *The Naturalistic Tradition in Indian Thought* (late 1961), which points to the usually overlooked nonmystical aspects of Asian thought.

In the traditional areas of inquiry, Charles Hartshorne published *The Logic of Perfection and Other Essays in Neo-Classical Metaphysics.* John H. Randall, Jr., published *The Career of Philosophy: From The Middle Ages to the Enlightenment,* a full-scale history of modern philosophy. In ethics, Henry D. Aiken published *Reason and Conduct; New Bearings in Moral Philosophy;* and in the philosophy of art, Albert W. Levi published *Literature, Philosophy, and the Imagination.* A much-awaited translation of the important book by the German existentialist Martin Heidegger, *Being and Time,* also appeared in 1962.

The 10th International Congress for the History of Science met at Cornell University (August 1962), the topic being the relations of history and philosophy of science. The International Institute of Philosophy met at Oxford University (September 1962), continuing in its attempt to further international philosophical understanding.

PHOSPHATES. See Index entry.

PHOTOGRAPHY

Several new photographic products and processes were introduced in 1962, and sales of photographic films, papers, chemicals, and equipment were reported higher than in 1961. It was reported that amateur photographers alone in the United States made over 2⅓ billion photographs; that 12% of American families own movie cameras; and that 99% of home movies are in color.

Some statistics indicate a substantial increase in the use of photography in industry and business and by the government. Total sales of photographic merchandise have increased 37% since 1954, including an increase of 270% for photocopying equipment, 22% for microfilming equipment, and 25% for blueprint and diazo equipment.

Similar growth was evident throughout the world, especially in Europe where the European Economic Community (Common Market) has been a factor in the record production and sales of camera equipment in West Germany and France. One of the key photographic markets in Europe is developing rapidly in Italy. The Soviet Union produced approximately one fifth of the cameras manufactured by the larger countries of the world.

Still Photography.—Practically all 35-mm. cameras introduced in 1962 were automatic, whether or not they were equipped with rangefinders. Many of the new cameras had built-in cadmium sulfide (CdS) exposure meters. These included the Nikon F, Minolta SR-7, Yashica Pentamatic S, Miranda DR f/1.9, Canon 7 with f/0.95 lens, and the Taron Marquis, said to be the first CdS rangefinder camera. Several new cameras—among them the Alpa 6C and Minolta SR-1—had f/1.8 lenses. The Kodak Motormatic 35F and Kodak Automatic 35F featured built-in "pop-up" flash units. The motorized Agfa Selecta M permits 30 pictures per minute. The Nikkorex 35 Reflex-Zoom camera is the first single-lens reflex (SLR) camera with built-in zoom lens (43–86-mm. f/3.5).

A diaprism finder on the Miranda DR and Mamiya C-3 cameras has a grid pattern which fractures the picture when out of focus and is claimed to be better than ground-glass plates for accurate focusing.

The Servo-Baldamat has an electric motor drive, powered by six small batteries that permit 20–25 shots per minute with Baldamatic cameras.

The Minolta SR-7 35-mm. camera is equipped with a cloth focal frame shutter. The Fujica Auto-M has a computer electric eye that can automatically change the selected shutter speed. The Zeiss Ikon Company made available interchangeable backs using rolls of 35-mm. film for the Contarex and Contaflex cameras.

The Nikon F 35-mm. camera is now available with a Photomic System which consists of a prism finder plus a CdS exposure meter. The acceptance angle of the meter is 75°, which is correct for normal and wide-angle lenses under normal conditions; and there is a converter tube that reduces the angle to 15° for use with telephoto lenses. The Nikkor Perspective Control (P.C.) f/3.5 wide-angle lens for this camera permits displacement of the lens in all directions parallel to the film plane on a front mounting plate.

The Widelux Super Wide-Angle camera Model F VI covers an angle of 140° and produces eleven 24 x 60-mm. exposures on a standard 20-exposure roll. The Rolleicord Vb is claimed to be the world's only five-format camera in which pictures from 35-mm. to 2¼ inches square can be made.

At least three new half-frame cameras were described: the Olympus Pen EE-S, the Petri 17, and the motor-driven Yashica Sequelle that gives 65 frames on a 36-exposure roll at rates as fast as two per second.

In the "aim-and-shoot" approach to simplification, the Brownie Fiesta camera appeared and, in Europe, the Voigtlander Vito Automatic II and the Rollei Magic II equipped with the Prontormat-S fully automatic shutter that sets the camera for lens aperture and shutter speed.

A picture width set for any number of degrees up to 360° can be obtained on the Cinerama Panoramic 35-mm. camera with automatic exposure and camera rotation.

A number of larger format cameras were introduced, including some automated single- and double-lens reflex 2¼ x 2¼ cameras such as the Praktisix, Bronica P, and Semflex Studio. Two new press cameras became available: the Mamiya 2¼ x 3¼ Press C and the Horseman 2¼ x 3¼ Press 960, which may represent a trend toward a compromise between the 4 x 5 and the 35-mm. formats. The Linhof 70-mm. Rollex 2¼ x 2¾ has a 53-exposure magazine. Benson-Lehner announced a

wide-angle 70-mm. camera providing a 160° field of vision in any plane. Identification-type cameras in 1962 included the 35-mm. Color Tran FotoSure ID camera and the Itek QUAD camera for taking one to four simultaneous identical photographs on Polaroid-Land film with 10-second processing. The Polaroid-Land MP-3 industrial view camera became available for industrial use.

Although little occurred in the subminiature field in 1962, two unique cameras were described: an ultraminiature panoramic camera, the Viscawide 16, forming a ⅖ x 2-inch picture on 16-mm. film; and a microminiature stereoscopic camera, manufactured by the Cam Corporation, designed for completely automatic operation, useful in the inspection of inaccessible areas and medical research.

The Fotron Model 360 camera marketed by the Traid Corporation automatically performs all operations, including electronic flash. Color-negative film (24 x 24 mm.) is introduced into the camera in preloaded, 10-exposure magazines.

More and more automatic cameras have exposure meters with CdS cells. These cells are considered the most significant advance in exposure meters in more than 25 years because of their greater sensitivity, especially at low light levels. Typical meters include the Sekonic Super Microlite, Spectra Combi-500, and the Honeywell Pentax.

Nickel-cadmium and silver-cadmium power supplies for electronic flash units have become very popular, but there is a trend indicating that small, leak- and spill-proof, rechargeable wet-cell batteries are being more widely used. As part of the "aim-and-shoot" trend, very small nickel-cadmium, battery-operated flash units are being incorporated into small and inexpensive cameras. Some of these units are the Braun-F-20, Monojet SP, and the PCA X-100. The Monojet UM is claimed to be the smallest nickel-cadmium electronic flash, giving 70–80 flashes per charge with a recycling time of 8–12 seconds. A close competitor is the Metz 109 nickel-cadmium flash, with 50 flashes per charge, which is claimed to be the lightest and most compact electronic flash available.

The Bell & Howell Tandem-Matic Professional unit is claimed to be the first innovation in still-picture projection since the invention of the slide projector. It gives the "lap dissolve" effect used in professional motion pictures, by means of two optical systems housed side by side. Otherwise, most new slide projectors are equipped with zoom lenses, sophisticated slide-changing mechanisms, and improved projection lamps.

Motion Picture Photography.—Major advances in amateur motion pictures have been made in the 8-mm. field, and other significant changes can be expected in the future. Now that improved films, cameras, and lenses are available, the 8-mm. system needs improvement to make it economical, as compared with the 16-mm. for professional and commercial use—especially with sound.

The year 1962 was highlighted by automation in motion picture equipment and simplified operation, particularly in the 8-mm. field. The single-lens reflex principle for viewing and focusing through the lens virtually eliminates parallax and focusing error. Zoom lenses were introduced on a wide scale with a significant increase in the usual zoom ratio of 1:3. The Cinemax 85E Auto Zoom, with a 1:5 ratio, and the Schneider Variogon Zoom lens, with 1:6 ratio, were adaptable to several cameras. Many cameras have through-the-lens exposure control, using the sensitive CdS photocells, in combination with zoom lenses; among them are the Fujica EE Power Zoom, Optronic Eye Reflex, Ricoh Zoomlex, Canon Reflex Zoom 82, and Keystone Horizon K-808.

The Bell & Howell Dual Electric Eye consists of two photocells, an "eye-within-an-eye," in which the second cell compensates for underexposure effects produced by backlighting. Introduced for the first time was continuous automatic exposure adjustment to the changing light on zooming, featured in the Sekonic Dual Run camera, which also has a flip-over film chamber to permit exposure of 50 feet of film without opening the camera. Some cameras, such as the Kodak Electric 8 automatic camera, eliminate conventional film threading by means of a drop-in film cassette.

Stereoscopic screen pictures have been demonstrated in England without special glasses or viewing aids, using the "Stereorama" attachment for 8-mm. cameras and projectors with a special wire grid placed in front of the screen. The Stereorama consists of a segmented plate and two supplementary lenses which in combination with the grid produce left-and-right-eye aspects, a visual three-dimensional effect.

In the professional field two new portable 16-mm. reflex cameras were announced: the Debrie Simmor 16-mm. magnetic-sound single-system camera and the Pathé-Products, Inc. Webo-M16-mm. reflex camera.

Motion picture projectors have been streamlined and automated with such features as automatic threading and rewind, zoom lenses, remote control, reverse operation, and editing facilities. The Leitz Cinovid features push-button operation and self-threading; the Keystone K-107R zoom projector has a small editing viewer; and the Kodak Analyst 8 projector, Model A75 is fully automatic with total remote control. The Kodak Chevron 8 projectors come with and without zoom lenses, and represent a completely new low-format design. The Technicolor 800 8-mm. projector operates with film cartridges loaded with 50-foot continuous loops by Technicolor, thereby eliminating threading and rewinding.

New 8-mm. sound projectors include the Videotronic 8, the Cinephonic 881 and 882, and the Fujica Zoom 8 sound projector, said to be the first such projector with a tonal range greater than commercial 35-mm. sound film. Bell & Howell introduced the Specialist Autoload Filmosound projector, said to be the first automatic-threading 16-mm. sound projector.

A liquid immersion gate for the projection of 35-mm. motion picture film was demonstrated by the Eastman Kodak Company. The film frame is held in sharp focus from center to edge.

Lenses.—Many new lenses were introduced as integral parts of equipment. The developments in zoom lenses were outstanding, particularly the power-zoom-operated or continuously variable zoom lenses. The Schneider f/1.8 Variogon 8–48-mm. lens has two attachments to increase its versatility: a power-zooming-operated attachment run by two small batteries, and the Vario Curtar 75x attachment that makes it possible to zoom from a true wide angle of 6 mm. to 48 mm. telephoto, a ratio of 1:8.

Other lenses introduced included the super-wide-angle Fisheye Nikkor lens for 35-mm. cameras, covering an angle of 180°; the 55-mm. f/3.5 Micro-Nikkor lens, which focuses from 4 inches (with a reproduction ratio of 1:1) to infinity; a series of Soligor telephoto lenses ranging from 135 mm. to 450 mm.; a Tele-Xenar 200-mm., f/4.8 lens for Kodak Retina cameras; Summicron f/2.0 lenses of 35-, 50-, and 90-mm. focal lengths; a 270-mm. f/6.5 Tele Optar lens for the Speed

Assembled by the Army Map Service from several hundred individual photographs, this composite photo of the moon is designed to help scientists in mapping the lunar surface.

Graphic; and two Leitz lenses especially designed for the wide-angle projection of slides.

The Barnes Engineering Company designed a special lens for ultraviolet studies in meteorology and space exploration; its elements are made of lithium fluoride and fused silica. The lens has a focal length of 105 mm., and a viewing angle of 40° while maintaining a flat focal plane. The Widt concern in Germany has made infrared-corrected lenses for aerial photography.

Sensitized Materials.—Several improved sensitized products were introduced for use in a variety of photographic applications. In the photocopy field, new diffusion-transfer copying machines and products appeared, such as the Transcribe and Transcribe Deluxe by Transcopy, Inc. The Verifax Fine-Line Matrix CS for single copy, and CM or "Magic Matrix" for multiple copies, were introduced for copying fine-screen magazine illustrations, fine-line detail, and similar material on improved equipment, using an automatic solution cartridge. In the related field of drawing reproduction, an improved Kodagraph autopositive film on Estar base with three times the speed of the former product was marketed.

New products for use in instrument recording included Kodak Linagraph Shellburst Film on Estar base for use in hydrogen bubble chamber and cinetheodolite photography; a rapidly processible two-color photographic paper (Kodak Kind 1613) designed to give maximum color discrimination; and two new direct-print papers, Linagraph 591 and 592, for use in direct-writing, high-intensity oscillographs providing high-contrast traces within 1 second.

Reduction of the exposure time in industrial radiography can be attained to a larger degree with Kodak Industrial X-ray film, Type F, which is 30–50% faster than other films of this kind with little, if any, change in other film properties.

Two improved products were also introduced by the Eastman Kodak Company for use in aerial photography: a Process E-3 Ektachrome Aero Film with increased speed and improved sharpness and gradation, said to be the only color film designed to magnify the short brightness range existing through aerial haze; and three improved glass-base plates for making diapositives of superior sharpness from aerial negatives.

Many color products described or introduced during 1962 included a reversal Agfachrome CT-18 film with a daylight exposure index equivalent to 50 ASA; Perutz color slide film rated at 50 ASA; Mercury Cinechrome 8-mm. movie film; and three new Ferraniacolor products—N27 negative roll film rated at 40 ASA, Reversal Double-8 cine film rated at 25 ASA, and P24 film rated at 16 ASA with a claimed resolving power in excess of 100 lines per millimeter. In addition to new sizes for some color products, Kodak introduced Ektacolor Professional film, Type S, with a speed of 80 ASA; 35-mm. Kodachrome II Professional film rated at 40 ASA with increased sharpness; finer-grained Eastman color negative film, Type 5251; and 35-mm. Kodachrome-X film with a daylight exposure index of 64 ASA and little, if any, change in sharpness and graininess from Kodachrome II film.

Photo Processes.—A number of nonsilver processes were described in 1962. The Minnesota Mining and Manufacturing Company announced a new type of electro-photographic system that automatically produces enlarged color prints from color negatives in less than 5 minutes. A new type of color print material, specially developed dyes and chemicals, and a newly designed automated machine are involved.

The National Cash Register Company described its Photochronic Micro-Image direct-positive technique, using light-sensitive dyes which permit image erasure by light of a different wavelength than that of the original source. To obtain permanent records it is necessary to print on a silver halide material.

Xerox Inc. and Technical Operations, Inc., plan to market a vacuum-evaporated silver bromide film which has no gelatin. It may be useful where high resolution and acuity, as well as rapid and simple processing, are desired.

The Dietzgen Company introduced its Ricopy diazo materials for document copying; these materials are developed by heat instead of by ammonia vapor or dilute carbonate solution.

The thermoplastic tape system of the General Electric Company consists of a positively charged layer overcoated with a thermoplastic layer that assumes a negative charge in the image areas when exposed to an electron beam. The tape is processed by heat, which softens the upper layer and allows the negative charges to be attracted to the positively charged underlayer, thereby producing a deformation read-out in a Schlieren optical system.

Kodak Ortho Resist, a new resin having a variety of uses including reticle making, printed circuits, and other microminiaturization applications, relies on light exposure to form an image by polymerization of the resin.

Photographic Procesing.—The need for simplified and rapid processing to provide data more quickly for interpretation was more apparent during 1962. Many companies not usually concerned with this aspect of photography designed processors to fit in their photographic systems, and others marketed unique processing devices for use in a wide range of applications. Many improved conventional processors were also marketed.

The basic roller-transport principle of the Kodak X-Omat processors has been used in machines marketed by the Pako Corporation and the Carr Company. The Versamat Film Processor, Model 11-M for sheet and roll films, and the Kodalith Film Processor, Model 324, for graphic arts use, were introduced by the Eastman Kodak Company.

The Picker X-Ray Corporation marketed a processor for 16-, 35-, and 70-mm. roll film with

machine speeds of 4, 3.2, 2, and 1.6 feet per second. Kodak described an experimental processor for either negative or reversal processing of 16- and 35-mm. films, consisting of a series of drums that rotate at about 300 revolutions per minute with their lower portions immersed in small solution tanks. A layer of processing solution is carried around the drum surface to process the film drawn over the upper part of each drum. With the solutions at 120°F., some films can be processed to a negative in 5 seconds or reversally processed in 8–9 seconds, exclusive of washing and drying.

The Filmsort 1000 Camera: Processor demonstrated by the Minnesota Mining and Manufacturing Company exposes and processes microfilm frames mounted in aperture cards. The entire operation requires approximately 30 seconds.

The Mauer-Matic portable processors for 16-, 35-, and 70-mm. films utilize specially formulated monobaths at 90°F. with machine speeds up to 15 feet per minute. A monobath is also employed in the Recordak PES Reader-Printer and in the "PoroMat" web process. PoroMat, manufactured by Photo Dynamics, Inc., is a highly absorbing, flexible material saturated with a monobath solution.

Diffusion-transfer chemistry for the processing of continuous-tone films was the basis for two new processing systems. The Anken Chemical and Film Corporation demonstrated its Ank-a-Matic processor for processing a new roll film at a speed of about 120 ASA. The film and print paper travel together automatically through the machine when the image transfer occurs. As the sandwich leaves the device, the paper is pulled away from the negative to produce a roll of prints in less than 2 minutes. Kodak described a simplified method called "web processing" which involves bringing film in contact with a web of water-receptive material soaked in processing solution. After the correct time of contact, the two are separated and the developed negatives are dried.

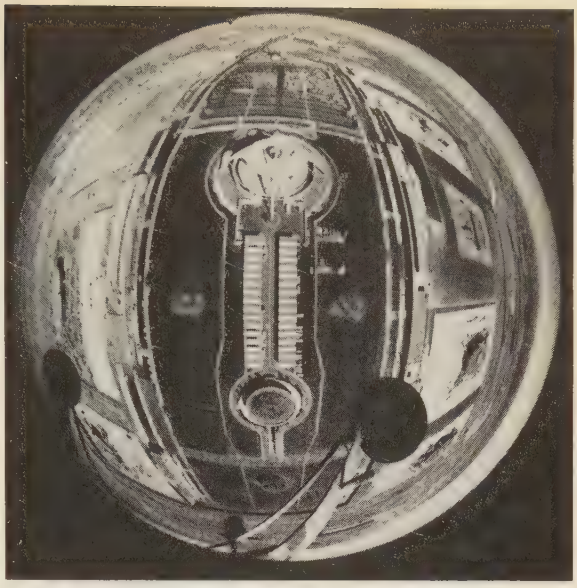
The Pavelle Corporation introduced its P-100 Automatic Daylight Color Printer-Processor, which produces color prints from a color negative in about 3 minutes.

High-speed processing of test and performance data on everything from a rocket to a pulse beat can be obtained in the Kodak Ektaline System, which uses special sensitized papers and a unique machine design to provide data at 200 feet per minute with a 6-second processing cycle.

Documentary and Industrial Photography.—Photocopy is a major growth field with many improved products, expanding markets, and increased competition; several significant mergers were realized during 1962. The market for copying equipment and supplies was estimated in 1962 at over $400 million. A series of new machines based on the use of the electrostatic process was demonstrated and/or marketed: Smith-Corona Marchant, Bruning Copytron 2000, Savin, Bohn, Old Town, Copyscope (Magnefax Corporation), and Apeco.

Microfilming, once used primarily for storing information, has developed into a versatile tool for a wide range of business and engineering applications. The reader-printer and aperture card have increased the utility of microfilm records. A "micro-strip reader" demonstrated by Recordak permits a telephone operator to locate one number out of a million in as little as 4 seconds. The video transmission system of Television Utilities Corporation provides transmission for miles of microfilm without camera or lights, and enlargement up to 60 times. The "Microscan" information system employs a uniform arrangement of 0.001-inch-diameter dots 1 one-hundredth of an inch apart to "pile" pages upon pages of material on top of one another on the same sheet of film.

Some other interesting applications of photography in industry include flash photographs made of a model screw propeller under test to show the areas of laminar and turbulent flow in the boundary layers over the blades; the use of high-speed Schlieren photography in diesel-engine combustion studies; a three-dimensional study of the flow pattern around the stern of a ship; a Waddell 16-mm. high-speed photo-instrumentation camera to investigate



UPI

This horizon-to-horizon view, with the Los Angeles International Airport in the center, was taken with a camera equipped with a special lens covering 187° field of view.

malfunctions in a heavy paper machine and check the pattern of chemical fluids forced under high pressure into nozzles; and photographing the simulated flow of gases in a chamber as it relates to the flow of hot gases in a brick kiln, the mixing of gases in a coke oven, or the evaluation of the effects of buoyancy on the paths taken by flames in furnaces.

Scientific and Applied Photography.—In the field of nuclear physics, a new elementary particle of matter, the omega meson, was discovered in the world's largest liquid hydrogen "bubble chamber." The omega meson weighs 1,540 times as much as the electron and, like the neutron, has no electrical charge. It has a lifespan of about one ten-thousand-billion-billionths (10^{-22}) of a second and only its track through the bubble chamber can be photographed.

Several research problems and related photographic equipment were described, including a heavy-duty impact-resistant Photo Sonics 1F rotary prism recording camera; the Royco Instruments Inc. Model 500 airborne-particle recording camera, for air-pollution studies, capable of recording particles 1 micron in size or larger; a Northrop Aviation 600-mm. f/2 lens with which the location of a missile in flight at a camera distance of 1,000 miles can be determined to within 25 feet; the Fairchild F-415A rotary-prism panoramic camera for horizon-to-horizon coverage at an altitude of 500 feet and an air speed of 600 knots; the Chicago Aerial Industries, Inc., aerial camera system with special wide-angle lens, designed to outrace supersonic reconnaissance aircraft while taking intelligence photographs day or night at virtually any altitude and speed; two techniques of shock-wave photography designed to detect and locate in space and time the various shock phenomena associated with nuclear bursts; and photographic recording of the earth's surface motion during nuclear blasts.

Special photographs were made in Dakar, Senegal, of the annular solar eclipse, July 31, 1962, to obtain information about the moon's shape and gravitational field. Project Celescope was described as a new satellite payload intended to give astrophysicists their first fine-grained look at distant galaxies in the ultraviolet portion of the spectrum.

In medicine, flash photographs have been made, without surgery, of the upper chamber of the human heart. A telescope with a right-angle lens system is attached to the eyepiece of a modified cardiac catheter for photography, and a thin rubber bladder and light bulb are inserted into the heart chamber. The Optiscan Eye Marker camera photographs both the eye motion and the object that the eye is observing. The luminescence emitted in the near infrared wave bands by substances irradiated with blue-green light has been photographed.

Some interesting developments in high-speed photography were reported. The KSC-600 Keer Cell framing camera has a capability of six frames at a rate of 100 million frames per second and exposure periods as brief as 5 one-billionths of a second. Six Kerr cells and a multifaced prism produce six images of the same event, from the same aspect, through the same optics. The major applications are in the recording of phenomena in hydrodynamic explosives, arc and plasma gas discharges, exploding wires, explosive detonations, hypervelocity impact, shock-wave studies, and nuclear detonations.

The National Research Council of Canada described a multistreak camera for studying two-dimensionally con-

verging gaseous detonation waves. The Beckman and Whitley Inc. Model 364 high-speed drum-type camera records nonperiodic wave forms with a total writing time of 6.99 milliseconds at top drum speed of 8,600 rpm. (400 feet per second). The Naval Ordnance Laboratory designed a camera for filming and timing fast action simultaneously in color and black-and-white, recording single-frame action at a shutter speed of one 20-billionth of a second, while operating at a speed of 1 million frames per second.

The English firm of Newman and Sinclair Ltd. introduced a portable electrically-driven 35-mm. camera capable of speeds up to 120 frames per second. A dissection-type high-speed camera produced by J. Langham Thompson Ltd. forms the image on a lenticular plate which breaks the image into dots. A series of such images is formed on a rotating disc which for read-out is rotated slowly to provide a slow-motion picture of an event. The framing rate is variable from 1,000 to 15,000 frames per second. A stereoptican camera made by Bensen-Lehner Corporation records two views from different angles, side-by-side on 35-mm. film, at rates as high as 15,000 pictures per second.

A fiber optics image-dissection camera has been described for recording sequences of pictures at rates up to 100,000 per second with visible light, and a few thousand per second using repetitive flash X-rays. There are 1,800 fibers in the fiber optics dissecting back, and therefore 1,800 image elements per picture. Optics Technology Inc. marketed a fiber probe inspection camera for the investigation of interior surfaces of channels carrying coolant through a pressurized water-type nuclear reactor, and of other inaccessible interiors or contour surfaces. Two 5-inch ribbons of fiber carry light from a 1,000-watt projection lamp to a tiny mirror at the end of a probe. About 2,500 fibers .002 inch in diameter placed side by side make a 5-inch ribbon.

Kodak Research Laboratories.

PHYSICS

Despite the publicity surrounding space technology and science, most physics research during 1962 continued in the familiar categories of nuclei and particles, the structure of matter, and the physics of the universe.

Particle Accelerators.—A new large machine, the Cambridge Electron Accelerator (CEA), was completed. Financed by the Atomic Energy Commission (AEC), it was built by the Massachusetts Institute of Technology and Harvard University, and others will share its use. The accelerator gives energies of 6 billion electron-volts (Bev.) to bunches of electrons driven through a tube forming a circle 236 feet in diameter. This energy is small as compared with the 30 Bev. of two proton accelerators; but electrons, rather than the much heavier protons, form the beam of CEA. Electrons in close collision with nuclei, protons, or neutrons do not experience the enormous though highly localized "nuclear forces," but much weaker electromagnetic influences. Experiments with electron beams of high energy, therefore, are not so much "atom-smashing" as "atom-probing."

Studies have gone on for some years, with electron beams of much less energy, to determine the inner structures of the proton and neutron, the primary building blocks of atomic nuclei. More such work was done in 1962, marked by the greater reliability to be expected from the growing mass of data. The CEA can add to these data and make possible other quite different experiments.

In the spring of 1962, the Atomic Energy Commission (AEC) awarded funds to Stanford University to build the world's largest linear electron accelerator, in the range of from 10 to 20 Bev., designed for later increase to 40 Bev. This project has suffered from changes of plans and vicissitudes of national policy for some years. The straight (hence, linear) tube for the beam will be underground, nearly two miles long.

Seven very large accelerators are now in operation—two in western Europe, one in the Soviet Union, and the rest in the United States. Several other large machines in design or construction include a 50-70-Bev. proton accelerator of the Soviet Union in Moscow and a 300-Bev. proton synchrotron for which the preliminary planning has been done by the European Council for Nuclear Research (CERN); it is reported that machines up to 1,000 Bev. are under consideration in the United States and elsewhere. (See also ELECTRICAL INDUSTRIES.)

Newly Discovered Particles.—The discoveries of several more light or heavy nuclear particles have been announced. The anti-xi-minus hyperon, with a lifetime less than 10^{-9} second, was detected independently at the world's two largest accelerators, the Alternating Gradient Synchrotron (AGS) of Brookhaven National Laboratories, New York, and the Proton Synchrotron (PS) of CERN, near Geneva, Switzerland. The charge of this anti-particle equals that of the proton, and its mass is about 40% greater. Such a particle had been hypothesized for some time, to round out a class of heavy particles.

Other physicists, also using the AGS, detected an f-zero meson, electrically neutral, 30% heavier than the proton, and short-lived (10^{-23} second). It seems to resemble what was predicted by some theoretical physicists. The uncharged eta-meson, another discovery, somewhat resembles the rho- and omega-mesons discovered in 1961. The eta-meson's mass is about half the proton's; its life is about 10^{-15} second. A separate experiment showed its spin to be zero.

French and Belgian scientists reported tentative identification of a zeta-meson, electrically charged and a little more massive than the eta-meson. The debate continues as to whether these various new mesons are more properly regarded as elementary particles or as resonance states of other, previously known, particles.

Probably most interest was aroused by detection—again at the AGS—of a second kind of neutrino and its mirror-image counterpart, an anti-particle. Neutrinos were postulated by theorists a generation ago to account for the otherwise inexplicable behavior of beta particles (electrons emitted in radioactive decays). The neutrino has no electrical charge and no rest mass, resembling photons of light in these respects though not otherwise. A neutrino can penetrate all the way through the earth with slight chance of collision or deflection. Hence detection is difficult; it was achieved only a few years ago. The new neutrino seems to be associated with mu-mesons much as ordinary neutrinos are with electrons.

The theory of elementary particles and their interrelations grows still more abstract and complex. A technique much exploited during 1962 is that of Regge poles, associating particles with the behavior of mathematical poles displayed by the complex angular-momentum function. Evidently the method is useful and significant, but its scope and meaning are still debated. (See also ATOMIC ENERGY.)

Solid-State Physics and Superconductivity.—A great deal of research has continued on widely varying solid-state problems. The stimulus of Advanced Research Projects Agency (ARPA) funds is probably beginning to show results, although the aim was a long-term expansion of research in materials science.

The superconductivity displayed by certain metals at very low temperatures has come to be

much better understood recently, thanks to a wealth of experimental and theoretical research. More attention was given to superconductivity in alloys and mixtures during 1962. The behavior of thin superconducting films on nonsuperconducting material, the reverse arrangement, and various "sandwich" structures particularly were studied.

Properties of Liquid Helium.—The gas helium (He) can be liquefied, for example, at atmospheric pressure and about 4°K. (roughly 7°F. above absolute zero). For decades liquid helium has been useful as a powerful refrigerant in experiments, but its own properties have fascinated both experimentalists and theorists. When liquid helium He^4 is cooled below its lambda point, about 2.2°K., it behaves like a normal fluid intermixed with a superfluid which has negligible viscosity. The fraction of superfluid rises toward unity (1) at absolute zero.

Liquid helium carries ordinary compressional sound waves, and the characteristics of such so-called first sound are still being studied. For some years the propagation of second sound has been known; there is no compression but an interchange of normal and superfluid components, while a wave of temperature change moves along, rather slowly. Third sound and fourth sound, phenomena peculiar to thin films and narrow tubes of liquid helium, respectively, were demonstrated three years ago. In 1962, fourth sound, characterized by both pressure and temperature waves, was studied in some detail. It requires temperatures below the lambda point, as do second and third sound; its propagation speed rises toward that of first or ordinary sound as the temperature falls.

The theory of liquid helium's properties appears to be in fairly good but not definitive shape. It is a many-body problem, akin to the theory of superconductivity in solids.

Optical Masers.—Much experimentation has been done with lasers (light amplification by stimulated emission of radiation).[1] Solids other than rubies, including glassy organic materials, have been shown to produce optical maser (microwave amplification by stimulated emission of radiation) effects. The duration of the flash, its delay after triggering, and its wavelength can now be chosen from a fairly wide range.

A spectacular application was the reception of bursts of light directed from earth and reflected from dark parts of the moon. A ruby optical maser was used; each pulse of red light had an energy of 50 joules and lasted 0.0005 second. Less than a billionth of a billionth of each pulse—about a dozen photons—returned to a receiving telescope, but the signal could be reliably detected and timed.

Many applications of lasers in research and industry are being explored. The General Electric Company has cut diamonds with the intense light beam of lasers, and the feasibility of arrays of synchronized lasers as high-energy radiation weapons is being studied. A calcium-fluoride laser has been developed by the Radio Corporation of America to convert sunlight directly into a coherent infrared beam which may prove useful for space communications and satellite tracking.

Another outcome of maser techniques was a demonstration of nonlinear optics. Sound waves in matter are nonlinear (though negligibly so at low intensities) because Hooke's law of elasticity is not exact. A single-frequency signal under nonlinear conditions gives rise to harmonics of itself at twice, thrice, etc., the original frequency; the strength of each harmonic depends on that of the original signal. Ordinarily, light and associated optical radiations have been considered strictly linear, except for small corrections based on general relativity. Certain crystals such as quartz, however, have a slightly nonlinear optical polarizability. Light of sufficiently high intensity, now available from lasers, produces second harmonics.

Renascence of Optics.—A decade or two ago most physicists would have agreed that optics was a dead branch of pure science. Optical techniques remained essential tools in research and technology, but it was assumed that all the interesting fundamentals were known. More recent developments have altered the situation. The human eye is no longer an integral part of, and limitation on, many instruments. Light amplifiers can produce true images brighter than the original object, which lenses or mirrors could not do. Fiber optics, in which various parts of a light beam are transmitted along flexible transparent fibers, greatly loosened the old restricted relations between object and image. Optical masers have opened new avenues also. The Optical Society of America, a member of the American Institute of Physics, is re-examining the role of optics in college curricula and research programs, and the need for scientists and engineers specializing in optics.

Physics of the Universe.—The outer space probed by optical and radio telescopes, and the near space explored by satellites, have been found to be far from empty. Vast numbers of almost undetectable neutrinos, emitted by stars, rush through space. Far fewer but easily detected cosmic rays—heavy particles such as protons—have various energies, some far exceeding those achieved by accelerators. Although our sun is probably one source, the origins of cosmic rays are still undetermined. In 1962, "cosmic" electrons were identified in space and attributed to solar flares.

Other "tourists" in space may be helium nuclei, He^3—which is an isotope of ordinary He^4—according to an interesting combination of astrophysical, nuclear physical, and space research. The abnormally magnetic star, 3 Centauri, is found to contain little He^4 but much He^3, as compared with ordinary stars. Bombardment by magnetically energized protons within such a star is a plausible mechanism for the conversion of He^4 to He^3. Solar flares are strongly magnetic and might cause a similar reaction, with expul-

[1] See THE AMERICANA ANNUAL, 1962, p. 602.

(Left) **Five optical maser tubes, each containing one of the "noble" gases (helium, neon, argon, krypton, and xenon), are checked by technicians. These five tubes emit continuous beams of coherent radiation in 14 infrared wavelengths. *(Right)* A new type of laser is the first man-made device to use sunlight directly without conversion to another type of energy. The 12-inch reflector gathers the sun's rays and focuses them on the crystal rod, which then gives off infrared emissions.**

BELL TELEPHONE LABORATORIES; RADIO CORPORATION OF AMERICA

sion of the He^3 nuclei. As possible confirmation of this phenomenon, parts of a recovered earth satellite, orbited when a solar flare occurred, appeared to have picked up much He^3 in space. (See also ASTRONOMY.)

Professor of Physics, Brown University.

PICCARD, Auguste

Swiss physicist and engineer: b. Lutry, Switzerland, Jan. 28, 1884; d. Lausanne, Switzerland, March 24, 1962.

An adventurous spirit in both thought and action, Auguste Piccard first designed new equipment and then employed it in explorations of the stratosphere and ocean, pointing the way to new fields of scientific endeavor. These pioneering efforts are described in his book, *Earth, Sky and Sea* (1956).

The brother of Jean Piccard, who also won fame as an aeronautical explorer, Auguste Piccard studied mechanical engineering at the Swiss Federal Institute of Technology in Zurich and later taught physics at the institute (1913–20) and at the University of Zurich (1920–22). In Zurich he collaborated with Albert Einstein in designing instruments for electrical measurements. Subsequently Piccard served as professor of applied physics at the Polytechnical School of the Free University of Brussels from 1922 until his retirement in 1954.

Piccard designed a sealed aluminum gondola which could be lifted by a large balloon, and on May 27, 1931, he astounded the world when he ascended from Augsburg, Germany, with Charles Kipfer, an assistant, to a record height of 51,775 feet, landing on a glacier near Obergurgl, Austria. Ascending from Zurich with another assistant, Max Cosyns, he was carried to another record altitude of 53,152 feet on Aug. 18, 1932. By 1946, Piccard had made some 28 balloon ascensions, carrying out many observations of atmospheric electricity and radioactivity in the stratosphere. He opened the study of high-altitude cosmic ray activity and predicted the feasibility of travel in the stratosphere.

After World War II, Piccard turned his energies to the development of his bathyscaphe (from the Greek, meaning "depth ship"), a free-floating, gasoline-ballasted undersea blimp with a stout steel observation gondola underneath. On Sept. 30, 1953, with his son Jacques, he descended off the west coast of Italy to a record depth of 10,330 feet. (On Jan. 23, 1960, Jacques and Lt. Don Walsh of the U.S. Navy went down in an improved model of the bathyscaphe to a record depth of 35,800 feet in the Marianas Trench off Guam in the Pacific.) In his later years, Piccard carried out a number of deep-sea studies for the U.S. Navy.

PINEAPPLES. See FRUITS.

PITCAIRN ISLAND

Pitcairn Island (area, 2 square miles) is a British colony situated in the Pacific Ocean between Tahiti and Easter Island. The uninhabited island was settled in 1790 by mutineers of H.M.S. *Bounty* and Tahitian women. Its population (1961 est.) is 126. Pitcairn and the uninhabited islands of Henderson, Ducie, and Oeno are administered from Fiji by the British high commissioner for the Western Pacific (Sir Kenneth P. Maddocks), assisted by a chief magistrate and four other members of a local council. Principal sources of revenue are the sale of local postage stamps, curios, fruits, and vegetables.

PITTSBURGH

Pittsburgh, Pa., ranked 16th among United States cities in the 1960 census, with a population of 604,332. The city (area, 54.1 square miles) is the center of an area comprising Allegheny, Beaver, Washington, and Westmoreland counties (3,051 square miles), standing eighth in population and economy among such areas in the nation. Pittsburgh's population has decreased by 72,474 since the 1950 census (when it ranked 12th in the nation), but that of the metropolitan area has risen by 236,464 to 2,449,700.

City government in 1962: a mayor (Joseph M. Barr) and a nine-man City Council, all Democrats. Budget (1962): $59,375,000. Real estate tax: 3.7% of assessed land valuation ($421,836,281, a decrease of $2,314,058 from 1961) and 1.85% of assessed building valuation ($803,139,481, up $11,259,288 from 1961). Other taxes include a 1% city wage tax, 10% amusement tax, 0.2% retail and 0.1% wholesale mercantile tax, and 0.2% personal property tax.

School budget (1962): $31,271,651. School tax: 1.6% on both lands and buildings, 0.4% personal property tax, 0.1% wholesale mercantile tax, 1% real estate transfer tax, and 0.5% wage tax. Value of bonds retired in 1961: $4,671,700; new bonds issued: $5,220,000.

Total public school enrollment (1962–63): 81,572; teachers and other professional staff: 2,812.

Transportation data (1961): freight by river, 41,783,144 tons, a decrease of 2,718,142 from 1960; by rail through the city, 60,168,882, a loss of 14,668,310 from 1960. Air cargo (mail, express, freight): 42,764,141 pounds, up 4,899,423. Air travel: flights, 274,250; passengers, 2,332,398.

Steel output in the Pittsburgh district (1961): 21.4% of total United States production. Coal production: in metropolitan area, 18,874,479 tons; in western Pennsylvania, 34,754,479 tons.

Employment (metropolitan area, September 1962): 852,400, of whom 387,100 were in manufacturing, mining, and primary metals; 109,400 in retail trade; and 204,000 in services, government, and miscellaneous employment. Unemployment stood at 8.7% of the total civilian labor force.

Other metropolitan area economic data: estimated per-family income (1962), $7,051; home construction (1961), 5,869 dwelling units ($84,865,715); estimated industrial capital expenditures (1961), $213,322,500.

Major developments of 1962 included the resignation of Gordon Bailey Washburn after 12 years as director of fine arts of Carnegie Institute and its international exhibitions, and his replacement by Gustav Von Groschwitz of the Cincinnati Art Museum; completion of steelwork on the new Federal Building; and the opening of the new Graduate Library School of the University of Pittsburgh.

Highway developments included the opening of the $13 million Etna bypass and interchange and the five-mile eastern extension of the Penn-Lincoln Parkway, connecting downtown Pittsburgh directly with the Pennsylvania Turnpike. Work was continued on the Crosstown Boulevard and Golden Triangle approaches to the new Fort Duquesne Bridge.

Pittsburgh's "renaissance," begun in 1946, reached its fastest pace with several new developments. Chief among these was the organization of the $250 million Oakland Corporation (including the University of Pittsburgh; Carnegie Institute of Technology; Mount Mercy College; Mellon, Carnegie, and Catholic Institutes; four local foundations; and several large insurance companies) to redevelop the entire Oakland area as a cultural center. Other forward steps included demolition for a new municipal stadium; completion of the frame of the revolutionary truss-wall Gateway Five building; beginning of work on a $2.3 million Point Park improvement program; and groundbreaking for a new parkside $25 million apartment building in the Gateway Center.

PLANTS. See AGRICULTURAL RESEARCH SERVICE; BOTANY; HORTICULTURE AND GARDENING; and the Index entry, *Plant Research.*

PLASTICS

Automobile bodies made of plastics reinforced with glass fiber were used on the 1962 futuristic Studebaker Avanti model and on 11,000 Chevrolet Corvettes. The lighter cars have faster acceleration, better braking, and fuel savings. The plastic body weighs about 300 pounds less than a comparable one made of steel, but the force needed to fracture it is considerably greater than that needed to dent a steel body. A cost analysis indicates that taking into consideration tooling, materials, assembly, and labor, up to 100,000 units of a given model car can be made more economically of reinforced plastics than of steel.

The building construction industry of the United States used 1.5 billion pounds of plastics in 1961, 9% more than in 1960. Protective and decorative coatings accounted for about 400 million pounds; flooring materials, 370 million pounds; adhesives for plywood and hardboard, 142 million pounds; and wire insulation, 186 million pounds. Moisture barriers, weather stripping, piping, lighting, and paneling were other major applications.

U.S. PRODUCTION OF PLASTICS, 1961–62

Material	1961[1]	1962[2]
	(Millions of pounds)	
Polyethylene	1,606	1,950
Vinyl resins (chloride, acetate, etc.)	1,260	1,500
Styrene resins (including copolymers)	1,145	1,250
Phenolic resins	665	700
Alkyd resins	541	550
Urea and melamine resins	440	450
Coumarone-indene resins	281	300
Polyesters	193	200
Cellulose plastics	148	150
Miscellaneous resins	578	650
Total	6,857	7,700

[1] Source: U.S. Tariff Commission. [2] Estimate on basis of first six months.

Polyethylene is rapidly supplanting wax, which flakes, in coating paperboard cartons for milk and juice containers. Cartons replaced 50% of glass bottles in this market in the past 10 years. It is estimated that 24 billion containers of milk alone are now sold each year—about 500 per family. The cartons required 26 million pounds of polyethylene in 1961 and are expected to consume at least 100 million pounds by 1965.

Plastics are currently being used by the U.S. Navy for: (1) dielectrics for wire insulation, panel boards, and electronic equipment; (2) foams for buoyancy, thermal and sound insulation, and void filling to keep water, vermin, and trash from accumulating; (3) fibers for protective covers and rope; (4) pipes for wash-down and ventilating systems; and (5) structural members, such as boats up to 57 feet long, submarine fairwaters (protective shields), tanks, propeller shaft coverings, and sonar domes.

POLAND

A country of east-central Europe, fully independent before World War II, Poland was taken over by the Communists in 1944–45 and made a people's republic dependent on the USSR. The largest of the Soviet satellites, it has an area of 120,359 square miles and a population (est. mid-1962) of 30,324,000. The principal cities, with their 1960 census populations, are Warsaw, the capital, 1,136,000; Łódź, 708,400; Kraków, 479,000; Wrocław, 429,200; Poznań, 407,800; and Danzig (Gdańsk), the chief port, 286,500.

Government in Exile.—Safeguarding the constitutional continuity of Free Poland, the legal wartime government still resides in London. It is recognized by the Vatican, Ireland, and Spain. August Zaleski is president of the republic, and Antoni Pająk is premier. A Council of Three, composed of Generals Władysław Anders and Tadeusz Bór-Komorowski and Ambassador Edward Raczyński, represents the union of democratic political parties.

Warsaw Government.—Within Poland actual power is exercised by the Polish United Workers' (Communist) Party, whose membership (1962) is reported to total 1,300,000. Władysław Gomułka, first secretary of its Central Committee, directs both domestic and foreign policy. The departments of the party parallel the ministries of the government; on March 3, 1962, Ryszard Strzelecki, a strict Communist, was placed in charge of cultural affairs, replacing Edward Ochab.

Aleksander Zawadzki, as president of the 17-member Council of State, is nominal chief of state, and Józef Cyrankiewicz has been premier since 1947. To the five existing vice premiers, a sixth was added on July 30, 1962, when Franciszek Waniołka was appointed. He was succeeded as minister of heavy industry by Zygmunt Ostrowski. Since the elections of April 1961, the 460-member Sejm (Parliament) has been composed of 255 representatives of the United Workers' Party, 117 of the United Peasant Party, 39 of the Democratic Party, 5 Znak Catholics, and 44 independents. Its powers are very limited. On May 30, 1962, the speaker of the Sejm, Czeslaw Wycech, became chairman of the United Peasant Party, replacing Vice Premier Stefan Ingar, who had been criticized for inefficiency.

Religion and Education.—The overwhelming majority of the Polish people are Roman Catholics, and the universally respected leader of the nation is the primate of Poland, Stefan Cardinal Wyszyński, archbishop of Gniezno and Warsaw, whose courageous struggle for religious freedom and human rights is described below (see *Events, 1962*).

In 1961 there were 7,149 kindergartens (395,100 pupils), 26,152 primary schools (4,827,600), 841 secondary schools (260,400), 417 schools for the handicapped (48,600), 917 adult primary schools (87,800), 220 adult secondary schools (76,200), 5,728 vocational schools (784,200), and, in 1962, 75 institutions of higher education (172,400).

Financial and Economic Indicators.—Budgeted revenue, 1962: 248.8 billion zlotys (at the tourist rate, 24 zlotys equal U.S.$1); expenditure, 245.2 billion. Net material product at market prices, 1961: 416 billion zlotys (up 40 billion from 1960). General industrial production index (1958 = 100), 1961: 134 (122 in 1960; average of 140, first 6 months of 1962). Consumer price index (1958 = 100), 1961: 104 (103 in 1960; average of 107, first 6 months of 1962).

Transportation and Communications.—Transport networks (miles, 1960): railways, 16,717; hard-surfaced roads, 64,895; navigable waterways, 4,350. Merchant marine (1961): 148 ships with an aggregate tonnage of 835,000. National airline: Polski Linie Lotnicze (LOT). Communications facilities: telephones (1961), 881,394; radio sets (1961), 5,268,000; television sets (1962), 900,000.

Industrial Production.—During the first year of the Third Five-Year Plan (1961–65), industrial production is estimated to have risen by 10.3%. Some newer industries failed to fulfill their planned goals, however, and the targets for 1962 were less ambitious. Nevertheless, production rose by 9.7% in the first half of the year, although the rate of increased industrial investment was only 6%, as compared with 14.5% in the first half of 1961. Chief industrial products (thousand metric tons, 1961, with 1960 figures in parentheses): coal and lignite, 126,592 (113,760); crude petroleum, 203 (194); iron ore, 2,386 (2,184); cement, 7,356 (6,588); pig iron and ferroalloys, 4,764 (4,560); crude steel, 7,236 (6,684); electrolytic copper, 22 (20); zinc, 182 (175); lead, 40 (40); cotton and mixed yarn, 164 (154); wool and mixed yarn, 60 (58); rayon and acetate filament yarn and staple,

74 (70); natural gas, 733 million cubic meters (550 million); electricity, 32 billion kw.-hr. (29 billion); and motor vehicles, 38,880 units (36,-720).

Agriculture.—Polish agriculture, which is still based largely on private ownership, was generally successful in 1961. Chief crops (thousand metric tons, with 1960 figures in parentheses): barley, 1,323 (1,310); oats, 2,965 (2,774); potatoes, 45,-318 (37,855); rye, 8,374 (7,878); sugar beets, 11,-550 (10,262); and wheat, 2,814 (2,303). On March 25, 1962, the 3,584,100 private farmers, who produce 90% of the total output, were subjected to a 16% increase in the land tax. Later, on June 28–29, the Sejm adopted seven laws affecting agriculture. One favored members of the unpopular collective farms, while the others were generally directed against private owners. Floods in May and June cut the 1962 harvest. On August 21, an agreement was signed with Canada for the purchase of from 300,000 to 500,000 tons of wheat, but conclusion of a new agreement with the United States remained in abeyance (see below, *Events, 1962*).

Foreign Trade.—Total exports, 1961: 6,014 million zlotys (5,302 million, 1960; 2,997 million, first half of 1962); imports, 6,747 million (5,980 million, 1960; 3,525 million, first half of 1962). Percentage distribution of exports (with imports in parentheses), 1961: machinery, industrial equipment, and transport equipment, 28.0 (29.1); fuels and industrial raw materials, 39.1 (49.7); agricultural products and foodstuffs, 21.4 (15.3); and industrial consumer goods, 11.5 (5.9). Chief customers (with percentage of total Polish exports received, 1961): USSR, 32.3; Czechoslovakia, 9.8; East Germany, 7.3; Great Britain, 6.9; West Germany, 5.7. Principal suppliers (with percentage of total Polish imports provided, 1961): USSR, 29.0; East Germany, 12.0; Czechoslovakia, 9.7; United States, 7.2; Great Britain, 6.0.

Events, 1962.—During the year the Polish Communist Party recognized the necessity of making some concessions to the liberal trends apparent in Polish life. A bill adopted by the Sejm on February 15 reorganized the Supreme Court into four chambers, dealing not only with civil but also with military, labor, and social insurance cases, which heretofore had been handled by separate administrative courts. Nevertheless, the ministers of justice and national defense retained the power to interfere with the court's decisions. Compulsory courses in Marxism, which had failed to indoctrinate the students, were dropped by both secondary schools and universities. Worker councils, formed originally in the factories in 1956, were to be revitalized, and elections within the Communist Party were to be conducted under more liberal rules. At the same time, however, beginning in January with the condemnation of Jerzy Kornacki to a year in jail on the charge of writing offensive anonymous letters to senior officials, the freedom of expression of Polish writers and correspondents was restricted.

Meanwhile, there was growing tension in church-state relations. In November 1961, Cardinal Wyszyński had written to Speaker Wycech of the Sejm, requesting the appointment of a mixed commission to investigate oppressive measures directed against the Roman Catholic Church in violation of agreements. Wycech's reply, delayed until Feb. 15, 1962, rejected the request as unnecessary and serving only propaganda purposes. In a letter of March 29, Cardinal Wyszyński repeated his request and reiterated the church's opposition to state control of religious education, the eviction of nuns from hospitals, interference with processions and religious meetings, and financial measures directed against the Catholic University of Lublin. Receiving a curt rebuff, he warned the faithful in his Lenten sermons against the spread of atheistic doctrines with official support. Although the cardinal was violently attacked in the Communist press, he did not hesitate to renew his criticisms of atheism in a pastoral letter, written on May 15, and read in the churches a few weeks later despite the attempts of the government to withhold it. In July, there was a new wave of hostile action against the church, leaving only four schools in which religious instruction is given, eliminating Catholic organizations from charitable activities, and increasing discriminatory taxes.

The primate could, however, make two trips to Rome, first in February to participate in preparatory work for the Second Vatican Ecumenical Council (see RELIGION—*Catholicism*), and then in October for the opening of the council. On both occasions he was received with particular cordiality by Pope John XXIII, who in March elevated Bishop Bolesław Kominek to the rank of archbishop of Wrocław (formerly Breslau), a gesture highly appreciated by the Poles, who await recognition of their western boundaries. Having succeeded in obtaining passports for 16 other members of the Polish hierarchy to accompany him to the opening of the council, Cardinal Wyszyński was waiting for similar permissions for 16 more; half of them eventually arrived.

Even the Communist regime finally realized that prominent Polish participation in the Ecumenical Council could strengthen the country's position in international affairs. Otherwise its foreign policy, strictly coordinated with that of the USSR, continued without change. Only the fact that, in contradistinction to other members of the Soviet bloc, Poland did not sever diplomatic and trade relations with Albania could be interpreted as evidence of a little more independence from Moscow. The Polish proposal for a zone in central Europe free from atomic weapons was renewed on March 3 by President Zawadzki and, as usual, at the UN General Assembly by Foreign Minister Adam Rapacki, author of the plan, who also served as leader of the Polish delegation to the Geneva Disarmament Conference. Of significance was Secretary Gomułka's visit to East Berlin on October 15. While the visit had been long delayed and began in a cool atmosphere, the final communiqué (October 21) emphasized the solidarity of the two regimes and echoed the Soviet point of view on the question of Berlin. The urgency of concluding a peace treaty with East Germany was stressed once more.

In view of such a persistent attitude concerning all controversial international questions, relations between Poland and the United States remained strained. In order to develop at least commercial exchanges, the minister of foreign trade, Witold Trąmpczyński, visited the United States in May, but the trip of Foreign Minister Rapacki to Cuba in June hampered the delicate negotiations for new Polish purchases of United States surplus farm commodities. In approving appropriations for the foreign aid program on October 8, the U.S. Congress authorized President John F. Kennedy to waive a ban on aid to Communist countries, thus permitting Poland to make such purchases.

Meanwhile, making a sound distinction between the Polish people and the Communist regime forced on them, the United States continued to promote cultural relations with Poland. Numerous American visits to Poland and invitations to Polish scholars to visit the United States contributed to intellectual cooperation, and in March

the United States decided to finance a $2,000,000 medical research program by Polish and American scientists. The agreement, announced on April 1, was prepared by long negotiations between the U.S. Public Health Service and the Polish Ministry of Health and Social Welfare.

POLICE

New headquarters for the International Association of Chiefs of Police was formally opened by the board of directors in Washington, D.C., on May 14, 1962, housing together for the first time all of the association's divisions and operations. The association's 69th annual conference was held October 6–11 in St. Louis, Mo. The International Juvenile Officers Association also held its annual conference in St. Louis.

Marking the first attempt to bring together at the international level the police profession and the professions of law, medicine and science, the First Inter-American Conference on Legal Medicine and Forensic Science was held at the School of Law, University of Puerto Rico, Rio Piedras, P. R., November 29–December 1.

Traffic Control.—In 1962 motor vehicle registration was expected to exceed 78 million. Expressing concern over the approximately 40,000 traffic deaths during the year, the President's Committee for Traffic Safety urged that specific measures be taken on national, state, and local levels to reduce the toll. Aerial techniques, including the use of the helicopter, were invoked. More than 36 states have authorized the use of chemical tests to determine the sobriety of drivers.

Hours.—A pronounced trend toward reduction of the workweek for policemen is observable. During 1959–62, more than 300 cities had reduced police hours from 45 to 40 per week.

Recruiting and Training.—The recruiting problem became more acute in 1962. An increasing number of police departments turned to the police cadet program, under which high school graduates may be appointed to the force at the age of 18 to perform clerical and other tasks until the age of 21, when they take the qualifying examination for regular appointment.

New police training programs were reported at New Haven College, the University of Oklahoma, and the University of Kansas City. The University of Oklahoma has been designated as the official training center for Oklahoma law-enforcement officers by resolution of the state legislature. Approximately 90 institutions were offering law-enforcement training at the university and college level, ranging from those with two-year programs offering a certificate or associate arts degree to those offering the doctoral degree.

Detection.—The Metropolitan Police Department of Washington, D.C., was among those departments turning to color photography as a tool of criminal investigation and identification. More than 30,000 35-mm. color slides of known criminal offenders are now in the files of the department. The same department inaugurated a two-way radio system on an experimental basis for foot patrolmen. Ridgefield and Hillside in New Jersey conducted 12-week courses in scientific hypnosis as an aid in interrogation, lie detection, and amnesia breaking.

St. Louis police in 1961 created a special tactical squad of judo-trained officers who pose in crime-ridden areas as women, derelicts, and drunks to combat attackers. The operation was so successful at apprehending hoodlums that New York City initiated a similar program in August 1962.

POLITICAL SCIENCE

In 1962, political science continued its rapid development both as a discipline and as a profession. Confirmation that the gradual recent reorientation of political science as a discipline has had wide impact is to be found in two significant studies—*Essays on the Behavioral Study of Politics,* edited by Austin Ranney, and *The Limits of Behavioralism in Political Science,* edited by James C. Charlesworth—and by the increased number of scientific contributions to the knowledge of government and politics published during the year. The two studies mentioned are valuable examples of the self-conscious examination by political scientists of the state of the discipline, and make clear the substantial changes that have been taking place in the discipline in recent years. One such change has been the integration of the characteristic "behavioralist" approaches, procedures, and goals into the discipline, which has, however, remained predominantly institutional in focus.

Significant developments are indicated in the profession by the rapid growth of the American Political Science Association, by increased services of the association to its members, by new programs for improving the professional qualifications of political scientists, by increased attention to teaching government and politics in the secondary schools, and by increased use of political scientists in important positions in government and industry.

The American Political Science Association is the official national professional organization of political scientists. At its 58th annual meeting, held in Washington, D.C., Sept. 5–8, 1962, papers were presented and discussions held on all major fields and on several special fields of political science. The retiring president, Prof. Charles S. Hyneman of Indiana University, delivered the presidential address, under the title, "Free Speech: At What Price?" The delegates were also addressed by Secretary of Agriculture Orville Freeman and Senator Jacob Javits of New York. Carl J. Friedrich of Harvard University succeeded to the presidency of the national association, and C. Herman Pritchett of the University of Chicago was named president-elect.

At the annual meeting, the Woodrow Wilson Foundation Award for the best book published in 1961 in the field of government, politics, and international affairs was presented to Robert A. Dahl of Yale University for *Who Governs? Democracy and Power in an American City.* The Leonard D. White Memorial Award was presented to Simon D. Perry for his doctoral dissertation, *Conflict of Expectations and Roles in Policy Science Behavior;* and Theodore J. Lowi received the James Kimbrough Owen Award for his dissertation, *At the Pleasure of the Mayor.* For the first time, the association presented the Atherton Press Political

Science Award for the best original manuscript in the field of political science. The prize was shared by Dan D. Nimmo for *News Sources and News Channels: A Study in Political Communication* and Frank J. Sorauf for *Party and Representation.*

In 1962 the national association continued to publish *The American Political Science Review.* It again conducted the Congressional Fellowship Program, enabling more than 25 young political scientists, journalists, and law professors from the United States, Asia, and the Middle East to spend a year as participant observers of the U.S. Congress; the Public Affairs Reporting Awards Program, which rewards young journalists for excellence in reporting state and local government and politics; and the Regional Seminars Program for teachers of political science in small colleges and universities throughout the United States.

An Internship Coordination Program was set up under the joint sponsorship of the national association and the Citizenship Clearing House. On an experimental basis during its first year, the program is designed to coordinate the activities of the increasingly large number of men and women working in congressional offices on internships from various colleges. The Committee on Comparative Politics of the Social Science Research Council conducted three seminars during the year as the first of a series of "Studies in Political Development."

A meeting of the Executive Committee of the International Political Science Association and a round table dealing with constitutionalism and the political role of the courts was held in Freudenstadt, Germany, Sept. 10–15, 1962.

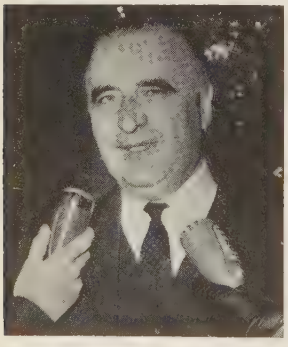
POMPIDOU, Georges Jean Raymond

Premier of France: b. Montboudif, Cantal, France, July 5, 1911.

Educated in the humanities, Georges Pompidou became a professor of literature at lycées in Marseilles and Paris, and has published several works on French literature. He became active in the French underground during



Georges Pompidou answers newsmen's questions on April 14 after his appointment as premier of France by President de Gaulle.

AFP FROM PICTORIAL PARADE

World War II, and in 1944 joined Charles de Gaulle's provisional government in Paris, serving as a policy adviser on information and education until the general's withdrawal in 1946. Pompidou remained in the French administration until 1954 when he joined the banking house of Rothschild Frères, later becoming director general, and continuing in finance until 1958 when de Gaulle returned to power as a result of the Algiers revolt. From June 1, 1958, to Jan. 7, 1959, Pompidou was president of the Council of Ministers, and after de Gaulle became president of the Fifth Republic in January 1959, Pompidou was appointed a member of the Constitutional Council.

Pompidou was designated as premier following the resignation of Michel Debré on April 14, 1962, and his cabinet won the approval of the National Assembly on April 27. The government was overthrown by a vote of censure in the Assembly on October 5, but after the Gaullist victory in the general elections, Pompidou was renamed premier on November 27. Only three new members appeared in the new cabinet which he announced on December 6. A long-time admirer of de Gaulle, he is unreservedly committed to the president's policies, and his place in the government removes the last vestige of ideological divergence between the premier and the chief executive. (See also FRANCE.)

POPOVICH, Pavel Romanovich. See biographical sketch under SPACE FLIGHT.

POPULATION STUDIES. See CENSUS DATA, U.S.; POPULATION TRENDS; and the Index entry, *Population Studies.*

POPULATION TRENDS

The population of the world passed the 3-billion mark in 1961 and, at an average rate of increase estimated at 1.8% or 55 million annually, totaled more than 3.1 billion as of mid-1962, according to United Nations population studies. The population growth was most pronounced among the areas of the world in Central America and Southeast Asia, where the annual rate of population increase is 2.7% and 2.6%, respectively. The area of least population growth is northwestern Europe, where the rate of increase is only 0.7%.

Table 1—WORLD POPULATION ESTIMATES
(Estimates are as of midyear of dates shown.)

Region	1950	1960	1961	Annual % increase, 1950–60
	(in millions)			
World	2,518	2,995	3,061	1.8
Africa	209	254	261	2.0
North America	219	265	273	2.1
South America	112	140	148	2.3
Asia[1]	1,389	1,679	1,714	1.9
Europe[2]	395	427	430	0.8
Oceania	13	16.5	16.8	2.4
USSR	181	214	218	1.7

[1] Excluding USSR but including Asiatic Turkey. [2] Excluding USSR but including European Turkey. (Table based on sources from the Statistical Office of the United Nations.)

United Nations statisticians found that birth rates have increased and death rates have decreased in nearly all countries, the only exceptions where the population has declined being East Germany, Ireland, and North Vietnam. It was found that in highly industrialized nations more than half of all deaths are caused by heart disease or cancer, and that in 40 of 47 countries for which relevant statistics are available, accidents result in more deaths than any other single cause. Married persons live longer than single persons in all parts of the world, according to the studies.

The so-called population explosion of recent years is due chiefly to improved standards of medical care, nutrition, and sanitation throughout the world. Countries having the highest rates of population growth are mainly those where birth rates have continued at high levels while death rates have declined because of recently introduced public health measures, as is indicated in Table 2 (on the following page). The accelerated population increase in recent decades has caused concern to many statesmen, scientists, and long-term planners, who fear that the world's population will outstrip the available food supply. (If the present population trends continue, the world's population is estimated to double every 35 years, and is pro-

Table 2—VITAL STATISTICS FOR SELECTED COUNTRIES

(Data are for 1961, unless otherwise indicated. For countries marked with an asterisk (*), data for birth, death, and infant mortality rates are provisional. *Estimated Population*—figures are for mid-1961, as reported by the United Nations. *Birth Rate*—crude rate (number of births per 1,000 persons). *Death Rate*—crude rate (number of deaths, exclusive of stillbirths, per 1,000 persons). *Infant Mortality Rate*—deaths of infants under one year of age per 1,000 live births, excluding stillbirths. *Annual Increase*—average percentage increase of total population. *Life Expectancy*—average expectation of length of life (in years) at birth, based on mortality conditions of period indicated. *Population Per Sq. Km.*—total area, including inland water (1 sq. km. = 0.3861 sq. mi.). Sources: *Statistical Yearbook 1961; Population and Vital Statistics Reports, July, 1962,* Statistical Office of the United Nations.)

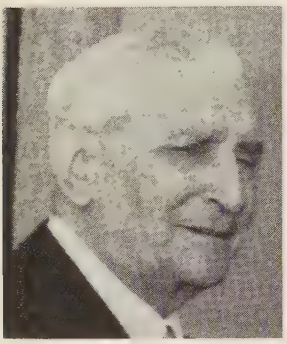
PORTUGAL

Portugal is a corporate republic on the Atlantic coast of the Iberian Peninsula in southwestern Europe. Including the Azores (888 square miles) and Madeira (305 square miles), metropolitan Portugal has an area of 35,598 square miles and a total population of 9,190,000 (1961 est.). The island population (1960 census): Azores, 336,933; Madeira, 282,678. Principal cities and populations (1960 est.): Lisbon, the capital, 818,382, and Oporto, 310,474. Portuguese is the official language.



Premier António Salazar of Portugal faced increasing opposition to his regime and to Portuguese colonial policies during 1962.

WIDE WORLD

Government.—Under the 1933 constitution, the government consists of a president (Américo Deus Rodrígues Tomás, elected June 8, 1958); a 130-member National Assembly, elected by direct suffrage for a four-year term; and an appointed 185-member Corporative Chamber, representing administrative, economic, and cultural corporations. The government is under the personal control of Premier António de Oliveira Salazar (assumed office July 5, 1932), who is assisted by a 14-member cabinet and a State Council. Premier Salazar is the leader of the only legal party, the National Union, which in the election of Nov. 12, 1961, won all seats in the National Assembly.

Education and Religion.—Number of schools (with enrollments), 1959–60: 18,743 primary (908,990); 344 secondary (194,910); Technical University at Lisbon (3,077); special (1,322); 3 universities (14,973). An estimated 80% of the population over 7 years of age is literate. Principal religion: Roman Catholicism.

Finance.—Government revenue, 1961 est.: 11,787 million escudos (11,404 million in 1960); expenditures, 11,780 million (11,337 million). The escudo fluctuated between 28.73 and 28.83 to the U.S. dollar during the first seven months of 1962. National debt: 13,192 billion escudos at the end of 1960. Gold and foreign exchange holdings: $743 million as of Aug. 1, 1962 (up $92 million from September 1961).

Transportation and Communications.—Transport networks (miles, 1960): railways, 2,235; main roads, 17,178. Merchant marine tonnage (January 1961): 570,583. Airlines carried 113,854 passengers in 1960. Motor vehicles: 247,065 (1960), including 25,421 motorcycles and 8,782 tractors; telephones, 394,824 (1960); radio receivers, 848,000 (1960); television sets, 90,000 (1962).

Economic Indicators.—Gross national product: $2.1 billion in 1961. Index of industrial production (1953 = 100): 182 in 1961 (185 in May 1961). Index of agricultural production (1952–57 = 100): 94 in 1959–60. Cost-of-living index (1958 = 100): 105 on July 1, 1962 (101 on July 1, 1961).

Manufactures and Minerals.—Chief industrial products (metric tons, 1961): cotton fabrics, 36,360 (34,600 in 1960); cotton yarns, 56,400 (51,400); wool yarn, 4,800 (4,920); cement, 1,248,000 (1,202,000); coal, 470,000 (434,000); iron ore, 242,400 (228,000); lignite, 158,400 (156,000); electric power, 302 million kw.-hr. (270 million).

Agriculture and Fisheries.—Chief crops (metric tons, 1961–62 est.): wheat, 404,000 (492,063 in 1960–61); maize, 539,000 (466,423); rye, 98,000 (138,404); rice, 179,000 (151,156); potatoes, 1,079,000 (1,041,315); wine grapes, 675,000 (1,146,000); olive oil, 91,000 (84,000). Other products (metric tons, 1960): cork, 179,210 (185,022 in 1959); resin, 76,250 (68,424); turpentine, 8,765 (8,829). The sardine catch totaled 139,304 metric tons in 1960 (121,394 in 1959).

Foreign Trade.—Total exports, 1961: 9,372 million escudos (9,407 million in 1960); imports, 18,857 million (15,681 million). Principal exports (in million escudos, 1961): cork, 1,384; fish, 1,268; wine, 767. Principal imports: iron and steel, raw cotton, motor vehicles, crude oil. Chief customers (with total Portuguese exports received, 1960, in million escudos): Great Britain (1,284); Angola (1,237); United States (1,049); West Germany (857); Mozambique (844). Principal suppliers (with total imports provided, 1960, in million escudos): West Germany (2,677); Great Britain (1,868); France (1,306); United States (1,152); Mozambique (1,156); Belgium (935); Angola (850).

Events, 1962.—The Portuguese government was beset by disorders within the country as well as revolts in the overseas territories as the new year began. On January 1, a band of rebels stormed a military barracks in Beja. Lt. Col. Jaime da Fonseca, undersecretary of state for the army, was fatally wounded in the attack. Forty rebels, including João Mariá Paula Varela Gómes, suspended army captain and left-wing political leader, were captured in the abortive coup. The army charged the Communist Party with having inspired the attack on Beja. The outbreak occurred as rumors circulated that Capt. Henrique Galvão, hijacker of the Portuguese liner *Santa Maria* in 1961, was on his way to Portugal from exile in Brazil (Galvão and 25 confederates were sentenced in absentia on February 7–11 to prison terms of from 15 to 22 years).

On January 31, in Oporto, 18 persons were injured when police fired on a crowd demonstrating against the Salazar regime. On March 27, the minister of education was forced to approve a rally of Lisbon University students three days after an earlier demonstration had been dispersed. The students declared a day of mourning and boycotted classes before Minister Manuel López de Almeida relented under pressure from the unanimous support given the students by the rector, Dr. Marcelo Caetano, and the 200 members of the university Senate. The opposition to the rally was indicative evidence of official hypersensitivity to Communist subversion.

Although the government prohibited May Day demonstrations, there were a number of casualties in clashes between the police and demonstrators in Lisbon and Oporto. The government charged the demonstrations were inspired by Communists as part of a plan to create widespread disorders. A total of 143 persons were reported arrested in the two cities. There was more sporadic shooting a week later in Lisbon. The appearance of clandestine leaflets appeared to substantiate charges of Communist responsibility for the disturbance. Another demonstration occurred at Lisbon University on July 1, to force the approval of free student associations by the premier.

These disorders appeared to be part of a resolute campaign of Portuguese Communists to assume the leadership of the political groups opposed to the Salazar regime. Reports circulated that Portugal was a principal Communist political target. Although Socialists and Democratic Christians had previously rejected Communist leadership, the overseas difficulties in Angola, the loss of Goa, and increasing criticism of Portugal in the United Nations caused the Communists to intensify their activity, both to create martyrs and to harden public opinion against Salazar by violence and sabotage. Moscow radio and other Soviet-bloc transmitters also increased their propaganda broadcasts to Portugal.

Incensed by the failure of the United States to support Portugal in the United Nations against India and the critics of her African policies, Premier Salazar began openly to attack the United States. On May 23 he assailed both the United States and the USSR as responsible for the trou-

bles besetting the Portuguese empire. When U.S. Secretary of State Dean Rusk arrived in Lisbon on June 27, he was courteously but coolly received. He assured Lisbon of United States friendship, and negotiations to extend American military rights to bases in the Azores Islands for five more years were resumed. However, the Portuguese were slow in agreeing to the extension as they bargained for United States support and understanding in the United Nations.

Despite the nation's internal and overseas problems, Portuguese economic expansion continued at the same rate in 1961 as in 1960, and authorities planned larger expenditures in 1962. Heavy military spending in Angola, however, had placed a severe strain on the economy, while the loss of the Indian enclaves (see INDIA) deprived Portugal of valuable iron deposits. As a result, the government was forced in 1962 to levy additional taxes on luxury items, gasoline, property sales, and higher incomes.

In May, Minister of State Dr. José Gonçalo Corrêa de Oliveira announced that Portugal would apply for admission to the European Economic Community (EEC), although membership for the overseas provinces was considered impracticable until such time as their economies had become more fully developed.

To finance the second six-year development plan, Portugal resorted to external loans totaling $157 million from the Export-Import Bank of Washington and other American, West German, and French banks. An additional $55 million loan was extended by the Export-Import Bank to purchase United States materials, equipment, and services for the construction of a $75 million bridge across the Tagus River at Lisbon (see also BRIDGES). A further stimulus to economic expansion was created by the formation of a consortium of ten Spanish and Portuguese bankers, with the tacit approval of the governing regimes in the two countries. With approval of Portugal's application for membership in the EEC, this association appeared to mark a trend toward a more liberal political and economic policy.

In October, the government began to consider granting greater administrative autonomy to Portugal's overseas territories. On December 3, however, a major reshuffle of the Portuguese cabinet was announced by Premier Salazar. The replacement by a naval officer of Professor Adriano José Alves Moreira, minister of overseas territories since April 1961, resulted primarily from his long-smoldering conflict with the armed forces over Angola. A slowdown or reversal of Moreira's policy of cautious reforms and especially limited autonomy in the overseas territories was widely predicted, although the Portuguese foreign minister declared on December 5 that Portugal did "not intend to change in any way its policy with regard to our overseas territories." (See also PORTUGUESE TERRITORIES.)

The cabinet reorganization apparently had the effect of strengthening the role of the military in the Portuguese government, as well as tightening the premier's control. Salazar's relinquishment of the defense ministry reflected the calmer atmosphere prevailing in Angola. Some liberal trends were apparently not reversed. New appointees to the ministry of economics were described as favoring Portuguese collaboration with the EEC, and the appointment of a liberal who had opposed repression of the student spring riots was regarded as an effort to establish better relations with student groups.

Professor of History, Rollins College.

PORTUGUESE TERRITORIES

The overseas territories of Portugal total approximately 806,944 square miles in area (more than 22 times that of metropolitan Portugal) and have a total population (1960) of 12,943,657 (45% more than Portugal). Constitutionally, the territories are overseas provinces of Portugal, with representation in the National Assembly in Lisbon. The territories are under the control of the Ministry of Overseas Provinces and are administered by appointed governors.

The territorial economies are closely integrated with that of Portugal, and together they account for 29% of all Portuguese exports and 14% of all imports. In an effort to develop the territorial economies, Portugal has allocated $300 million as part of its second six-year development plan (1959–64) for new iron ore, manganese, aluminum, ceramic, rubber, sugar, soap, tobacco, and textile industries.

Events, 1962.—Premier Salazar's threat, on January 3, to withdraw Portugal from the United Nations was but one indication of Portugal's determination to defend its overseas territories. On January 30, the UN General Assembly warned Portugal in a resolution, passed 99–2, to cease "repressive measures against the people of Angola." Sponsored by 45 Asian and African nations and opposed only by Spain and South Africa, this resolution was denounced by Portuguese authorities as unwarranted interference in a domestic matter. The UN Committee on Territories under Portuguese Administration, however, continued its investigation of conditions in Angola and Mozambique and, on August 8, recommended that the UN General Assembly request immediate independence for all Portuguese overseas territories.

Confronted with this international censure, the Portuguese began, on August 15, to implement a law of Nov. 8, 1961, which aimed at the full economic integration of the overseas provinces with metropolitan Portugal by Jan. 1, 1972. Dr. Adrian Moreira, minister of overseas provinces, had already announced, on April 26, the promulgation of a new rural labor code for Portuguese territories, effective October 1, which aimed at the elimination of distinctions between cultural and ethnic groups and guaranteed equal rights to women.

Although the Portuguese reported the surrender of 80,000 Angolan rebels between Oct. 31, 1961, and Jan. 5, 1962, 45,000 of whom had returned from asylum in the Republic of the Congo (Léopoldville), sporadic fighting was still reported in the northern areas of Angola, and Angolan refugees in large numbers continued to flee to the Congo. By February 2, the Union of Angolan Peoples (UPA), headed by Holden Roberto, had established a rudimentary government near the Congolese border and continued to import foreign weapons and transport them to rebel villages.

Three months later, on April 5, Roberto announced from the Congo the formation of an African government-in-exile for Angola, under his leadership as premier and organized as the result of the fusion of the UPA and its bitter rival, the Angolan Democratic Party, representative of tribal groups in northwest Angola. By May 14 there were 12 Angolan parties in the Congo. Some advocated cooperation with the Portuguese, some recommended passive resistance, and others represented tribal factions. Only two commanded any mass support in Angola and among the refugees in the Congo. One was the UPA led by Roberto; the other was Mario de Andrade's Popular Movement for the Liberation of Angola (MPLA). An-

drade insisted that his party was non-Communist, but many of his followers were being trained in eastern Europe and the USSR. Roberto asserted that the fight for independence should be waged solely with African support. His followers, largely Negroes, were deeply suspicious of the mulatto intellectuals dominating the MPLA. An open feud broke out between the two groups.

New attacks on Portuguese forces by Angolan rebel guerrillas were reported on May 18. Two weeks later (on June 1), 24 young Angolan rebels returned after eight months of guerrilla training by Algerian nationalists in Tunisia. Roberto announced that these rebels would be used to train 200 other Angolans in guerrilla tactics. The first concrete evidence of Congolese support of the Angolan exiles was given on August 20, when Roberto announced that his party, now the National Front for the Liberation of Angola (NFLA), had established a military training base for Angolan rebels in a camp near Thysville "generously donated" by the central government of the Congo.

On August 10, Dr. Agostinho Neto, Angolan nationalist leader long imprisoned in the Cape Verde Islands, appeared in public in Léopoldville following his escape from house arrest in Portugal. Regarded as the dean of nationalist leaders, Neto had been named honorary president of the MPLA while in prison. In an effort to bring an end to the open feud between the MPLA and NFLA, Neto called for the formation of one political body and a single military command representing all factions.

A United Nations subcommittee report, released on November 20, again criticized Portuguese policy in Angola. Portugal sharply attacked the report, accusing the investigating committee of bias, and denouncing several African states for fomenting rebellion in the territory. By mid-December, the Portuguese were reported to have about 44,000 troops in Angola and had undertaken to mop up remaining resistance.

On December 18 the UN General Assembly voted, 57–14, to condemn Portugal's "colonial war" against Angola and to request the Security Council to take appropriate measures, including sanctions, to force Portugal to halt "severe repressive measures" and to grant independence to the Angolan people. The resolution, which also called for an arms embargo, was opposed by Portugal's NATO allies.

The Portuguese also took precautionary measures against trouble in other provinces. In mid-March, four leaders of a Guinean nationalist organization were arrested for possession of arms, nationalist documents, and plastic bombs. The arrests marked rising nationalist feeling in Portuguese Guinea, resulting partially from the independence of neighboring Senegal and French Guinea. A week later, 50 more Guineans were arrested. Portuguese authorities declared, however, that there were no more than 900–2,500 Guinean nationalists, and that the 5,000 Portuguese troops were maintaining firm control.

The repatriation of 4,332 Portuguese from the former Indian enclaves of Goa, Diu, and Damão began on May 5, and by May 22, 2,000 interned Portuguese soldiers and sailors had returned to Lisbon as bitter reminders of India's seizure of the enclaves on Dec. 18–19, 1961. On June 25, Portugal took retaliatory measures against India by cancelling residence permits granted to Indian subjects in Portuguese territories and ordering their assets liquidated.

Fearing that Indonesia might annex Timor, in the Indonesian half of which there was a large military force, Portugal began in August to bolster its garrison in Timor by sending 1,000 troops as "replacements." In Macão the Portuguese were confronted by a flood of refugees from Communist China. In the six months after Sept. 1, 1961, it was estimated that 42,475 immigrants had arrived in Macão, creating a serious burden for the small territory. Six weeks later the number of refugees had increased to 80,000 and was rising at the rate of 300 a day.

Territories in Africa. *Mozambique* (*Portuguese East Africa*).—A territory extending some 1,500 miles along the east coast of Africa. Area, 302,328 sq. mi.; pop., 6,592,994 (1960). Europeans: 65,798 (1955); mixed races, 29,873; Indians, 15,235; *assimilados* (natives granted Portuguese citizenship), 4,554. Lourenço Marques (pop., 1955 est., 105,000) is the capital and chief port.

The governor general (Rear Adm. Manuel María Sarmiento Rodrígues) is assisted by an advisory Government Council and a 24-member Legislative Council. In the 1962 budget, revenue and expenditures were estimated to balance at 3,999.6 million escudos; in 1961 there was a budgetary surplus of 3 million escudos. Public debt in 1960: 1,438.4 million escudos. Number of schools (with enrollments), 1959–60: 3,297 primary (418,519); 8 secondary (2,550); 75 technical (10,400); 6 normal (593).

Trade, 1960 (in million escudos): exports, 2,099.2; imports, 3,646.2. Chief products (with 1960 exports, in tons): sugar (112,249); maize (466,000); cotton (40,753); sisal (25,903); cashew nuts (55,848); gold (9.2 kg. in 1959); beryl (1,414 tons in 1959); bauxite (4,459). Electrical production: 189 million kw.-hr. (1959). Exports in 1959 went principally to Portugal (27.5%), India (17.4%), and Great Britain (12%).

Transportation network (1960): railways, 2,000 miles; roads, 23,459 miles (main roads, 2,548 miles). Motor vehicles (1959): 29,927 passenger cars; 8,707 lorries and buses; 2,581 motor cycles. Telephones: 12,426 (1960); radios, 41,000 (1960).

Angola (*Portuguese West Africa*).—A territory on the west coast of Africa, south of the Republic of the Congo. Area, 481,350 sq. mi.; pop., 4,832,577 (1960). The province includes Cabinda (area, 3,000 sq. mi.; pop., 55,000), an enclave in the Congo separated by the Congo River estuary from Angola proper. Europeans: 109,568 (1955). São Paulo de Luanda (pop., 1955 est., 189,500) is the capital. Other important towns: Lobito (31,630); Nova Lisboa (37,381); and Benguela (15,399).

The governor general (Gen. Venancio Deslandes) is aided by an advisory Government Council and a Legislative Council of 18 elected and 8 appointed members. Revenue (1960): 2,730.8 million escudos; expenditures, 2,633 million escudos. Development expenditure in 1962: 725 million escudos (497 million in 1961). Public debt: 1,174 million escudos at the end of 1959. Number of schools (with enrollments), 1959–60: 1,672 primary (104,027); 37 secondary (6,462); 48 professional (5,382); 2 normal (326); 8 mission (581). An estimated 99% of the indigenous population was illiterate in 1950.

Trade, 1960 (in million escudos): exports, 3,587.4; imports, 3,767.9. Agricultural products (with 1959 exports in metric tons): coffee (88,999); maize (149,184); sugar (29,872); palm oil (8,747); palm kernels (7,823); manioc (35,702); beans (10,806); sisal (54,276); wood (54,580). Mineral production, 1960: diamonds (933,646 carats); iron ore (658,954 metric tons); copper (17,323); manganese (23,340). Fish catch: 267,170 metric tons (1959). Imports: textiles, machinery, coal, and foodstuffs. Manufactures: fish products, cement, and vegetable fibers. Electrical production: 123.1 million kw.-hr. (1959).

Railways: 1,932 miles; roads, 22,059 miles; passenger cars, 29,700 (1960); commercial vehicles, 12,000 (1960); telephones, 7,918 (1960); radios, 44,000 (1959). The province is served by DETA and three other airlines, with the principal airport at Luanda.

Portuguese Guinea.—A territory on the west coast of Africa, bordering on Senegal and Guinea, and including the Bijagós Islands. Area: 13,948 sq. mi.; pop., 570,000 (1960 est.). A large portion of the native population is Muslim. Bissau (1950 pop., 18,309) is the capital and chief port. Revenue (1960): 126.2 million escudos; expenditures, 141 million escudos. Number of schools (with enrollments), 1957–58: 164 primary (11,142); 1 secondary (243); 21 technical (861). Trade (in million escudos): imports, 243.3 (1960 est.); exports, 199.6 (1959 est.). Chief products: rice, palm oil, groundnuts, coconuts, timber, wax, seeds, and hides. Roads: 2,042 miles (1958); radios, 1,400 (1959).

Cape Verde Islands.—The territory consists of 10 principal islands and 5 islets in the Atlantic Ocean about 370 miles west of Dakar. Area, 1,557 sq. mi.; pop., 201,549 (1960). The majority of the population is of mixed European-African descent. Capital: Praia (pop., 9,980). Revenue and expenditures balanced in 1961 at 101.5 million escudos. Public debt: 332 million escudos (1960). Number of schools (with enrollments), 1959–60: 128 primary (8,416); 2 secondary (1,165); 5 technical (351); 1 missionary (33). Trade, 1960 (in million escudos): exports, 306.4; imports, 348.7. Chief products: coffee (1960

exports, 42 metric tons), salt, tuna, bananas, and nuts. Electrical production: 5.3 million kw.-hr. (1959). Roads: 420 miles (1960); radios, 1,600 (1959). The island of São Vicente is a fueling station for ships, and an airport at Ilha do Sal serves transatlantic traffic.

São Tomé and Principé.—Two islands 125 miles off the African coast in the Gulf of Guinea. Area, 372 sq. mi.; pop., 60,159 (1960). Europeans: 1,152 (1950). São Tomé (pop., 7,817) is the capital. Revenue (1960): 94.7 million escudos; expenditures, 86.7 million escudos. Number of schools (with enrollments), 1959–60: 21 primary (2,864); 1 secondary (171); 1 technical (70). Electrical production: 2.3 million kw.-hr. (1959). Trade, 1960 (in million escudos): exports, 211.8; imports, 135.5. Chief exports: copra, coconuts, coffee, cacao, and palm oil. Roads: 172.7 miles (1959); telephones, 399 (1959); radios, 600 (1959); passenger cars, 600 (1959); commercial vehicles, 200 (1959).

Territories in Asia. *Macão.*—The territory (area, 6 sq. mi.; 1960 pop., 169,299) includes the city of Macao, situated on Chungshan Island in the delta of the Canton River, 40 miles west of Hong Kong, and the two adjacent islands of Taipa (area, 2 sq. mi.; pop., 6,148) and Colôane (area, 2 sq. mi.; pop., 2,764). The Chinese majority (98%) has been rapidly increased by refugees from the mainland. Revenue and expenditures balanced in 1960 at 137.8 million escudos. Number of schools (with enrollments), 1959–60: 120 primary (31,925); 30 secondary (5,916); 17 technical (1,393); 1 seminary (69). Macão is an entrepôt for trade with China, a famous resort, and a gambling and smuggling center. Trade, 1960 (in million escudos): exports, 56.3; imports, 158.7. Electrical production: 14.2 million kw.-hr. (1959). Fishing is the chief industry (6,636 metric tons in 1959). Telephones: 2,363 (1960); radios, 5,000 (1959).

Portuguese Timor.—Lying between the Celebes Islands and Australia, the territory (area, 7,383 sq. mi.; 1960 pop., 517,079) consists of the eastern part of the island of Timor; the enclave of Oe-Cusse, or Ambeno (area, 310 sq. mi.; pop., 16,281), in the Indonesian part of Timor; and the islands of Atauro (area, 72 sq. mi.; pop., 4,059) and Jaco (area, 5 sq. mi., uninhabited). Dili (pop., 7,000) is the capital and chief port. Revenues and expenditures balanced in 1960 at 103.5 million escudos. Number of schools (with enrollments), 1958–59: 111 primary (5,893); 3 secondary (290); 1 technical (146). Trade, 1960 (in million escudos): exports, 45.6; imports, 57.3. Chief exports: coffee, sandal root, copra, manioc, maize, rubber, and wax. Roads: 1,251 miles (1959); telephones, 494 (1959); wireless stations, 4.

Professor of History, Rollins College.

POST OFFICE DEPARTMENT

The Post Office Department in 1962 continued to handle record volumes of mail. It instituted new transportation and personnel programs and continued to improve its mail-handling techniques.

Employee's organizations, with full rights of negotiation and contractual agreements (except in matters set by Congress) were chosen in elections on June 15. A merit promotion program providing equal promotional opportunities for all employees, with no restrictions on age, sex, or race, was instituted; the position of senior carrier was created for more than 10,000 mail carriers in urban areas. Transportation of mail by highway from Seattle, Wash., through Canada to Fairbanks, Alaska, was inaugurated in September 1961 and extended to Anchorage, Alaska, in April 1962.

Congress on Oct. 5, 1962, approved new postal rates, which were to become effective on Jan. 7, 1963. Among other changes, first-class and air mail postage was to be increased by 1 cent an ounce and post cards by 1 cent apiece.

Net revenue of the Post Office Department in the 1962 fiscal year was $3,557 million, an increase of 3.9% over the preceding year; appropriation obligations incurred for the year were $4,332 million, an increase of 1.9% over the fiscal year 1961. The postal revenue gap on an obligation basis for the year was $775 million, after a reimbursement of $63 million from the U.S. Treasury for certain public services. The volume of mail processed by the department during the fiscal year 1962 increased (in terms of originating mail) to 66.5 billion pieces, compared with 64.9 billion in the fiscal year 1961.

At the end of the fiscal year 1962, the department had a total of 588,477 employees, including 34,639 postmasters, 123,941 regular city carriers, 31,201 regular rural carriers, 185,068 regular postal clerks and mail handlers, and 153,781 substitute employees. On June 30, 1962, there were 34,797 post offices and 10,156 classified and contract stations and branches, and rural stations.

The Postal Savings System had 1,271,858 depositors at the close of the fiscal year 1962, to whom was credited $583 million on outstanding postal savings certificates, exclusive of accrued interest. Depository locations at the end of the year numbered 5,205.

PRESBYTERIAN CHURCHES[1]

The 174th General Assembly of The United Presbyterian Church in the United States of America met at Denver, Colo., on May 17, 1962. The Rev. Marshal L. Scott, dean of the Presbyterian Institute of Industrial Relations, Chicago, Ill., was elected moderator. Ruling Elder Edward C. Logelin was appointed vice moderator.

The special committee authorized in 1961 to invite other communions to join in exploring the establishment of a united catholic, reformed, and evangelical church reported meeting with representatives of the Protestant Episcopal and Methodist churches and the United Church of Christ. This group, now known as the Consultation on Church Union, will continue conferences, inviting other communions to join in exploratory consultations.

An exchange of apologies and forgiveness took place between the United Presbyterian Church and the Cumberland Presbyterian Church over the division that occurred in 1810 and the partially successful reunion in 1907. There were no plans for an immediate reunion.

PRESBYTERIAN CHURCH STATISTICS

Church	Ministers	Churches	Members
Associate Pres. Ch. Synod	5	6	650
Associate Ref. Pres. Ch. Gen. Synod	120	145	26,765
Bible Presbyterian Ch.	164	69	5,956
Cumberland Presbyterian Ch.	748	971	83,642
Cumberland Presbyterian Ch. in the U.S. and Africa	125	121	30,000
Orthodox Presbyterian Ch.	138	92	11,175
Presbyterian Ch. in the U.S.	3,850	3,998	913,582
Reformed Pres. Ch. in North America, Gen. Synod	24	18	2,073
Reformed Pres. Ch. of North America Synod	100	71	6,118
United Presbyterian Ch. in the U.S.A.	12,248	9,222	3,249,007

A slight decrease in total communicant membership for 1961 was due to the release of the Synod of the Punjab in Pakistan, which became an independent synod. Total contributions were

[1] In 1962, distinctively Presbyterian churches in the United States included The United Presbyterian Church in the United States of America; Presbyterian Church in the United States; Reformed Presbyterian Church in North America, General Synod; Reformed Presbyterian Church of North America Synod; Associate Presbyterian Church Synod; Associate Reformed Presbyterian Church General Synod; Cumberland Presbyterian Church; Cumberland Presbyterian Church in the United States and Africa; Orthodox Presbyterian Church; and Bible Presbyterian Church.

$285,380,476, of which $52,496,479 was for benevolences.

The 102nd General Assembly of the Presbyterian Church in the United States was held in Winston-Salem, N.C., May 10–15, 1962. Ruling Elder Edward D. Grant of Baton Rouge, La., former executive secretary of the Board of Christian Education, was elected its moderator. This church serves primarily the southeastern and southwestern areas of the United States. Its total contributions amounted to $96,637,354, of which $22,519,819 was spent for benevolences.

SAMUEL W. SHANE,
Associate Stated Clerk, General Assembly, The United Presbyterian Church in the U.S.A.

PRINCE EDWARD ISLAND

Prince Edward Island, the smallest Canadian province, is situated in the Gulf of St. Lawrence, north of Nova Scotia and New Brunswick. It has an area of 2,184 square miles and a population of 106,000 (June 1, 1962 est.). Principal communities, with their 1961 populations, are: Charlottetown, the capital, 17,956; Summerside, 8,387; Parkdale, 1,735; Souris, 1,479; and Montague, 1,100.

Government.—The crown is represented by a lieutenant-governor (F. Walter Hyndman in 1962), appointed by the government of Canada. An Executive Council of nine members, headed by Premier Walter R. Shaw, is responsible to the Legislative Assembly of 30 members (15 councilors elected by property franchise and 15 assemblymen elected by popular franchise). The judiciary consists of a Supreme Court of four members (Thane A. Campbell, chief justice), and county courts for each of the three counties. The province has four members in the federal House of Commons and four in the Senate.

Education.—School enrollment, 1960–61: elementary, 19,784; high school, 5,229. University enrollment, 1961–62: 683. Total 1961–62 provincial expenditure on education: $2,992,621.

Finance.—The gross funded debt of the province in 1961–62 was $29,960,000, less sinking funds of $4,924,544, leaving a net funded debt of $25,035,457. The net unfunded debt was $8,395,870.

Public Welfare.—For the fiscal year ending March 31, 1962, the federal government paid out $3,205,989 in family allowances on behalf of 39,593 children in 14,099 families, and $5,158,114 in old-age security pensions to 7,562 pensioners. The provincial government, in the year ending March 31, 1962, paid out $500,244 in old-age assistance payments to 897 recipients, $53,886 in pensions to 80 blind persons, and $521,757 in assistance to 780 disabled persons. In the same period, mothers allowances and assistance for 643 children under 18 years of age totaled $131,300.

Transportation and Communications.—As of Nov. 30, 1962, there were 3,211 miles of provincial roads, of which 962 were paved and 1,451 were improved. The Canadian National Railway has 282 miles of track on the island. Two ferry systems connect the province with the mainland. The province has two airports, at Charlottetown and Summerside, and the Maritime Central Airways provides regular passenger and freight service. As of Nov. 30, 1962, there were 20,582 telephones; 21,829 passenger cars, and 7,252 trucks.

Agriculture.—Farm cash income in 1961 was $24,600,000. The principal crops were potatoes, valued at $7,490,000; hay, $6,000,000; oats, $4,250,000; wheat, $127,500; and barley, $36,400. The value of dairy products was $5,043,000.

Fisheries.—Sea products landed in 1961 (with landed value): fish, 36,521,000 pounds ($4,170,872); lobster, 9,500,000 pounds ($3,054,956); Irish moss, 23,593,233 pounds ($313,502). The total market value of all sea products was approximately $7,000,000.

Events, 1962. The most significant event in the island in 1962 was the commencement of construction of the $5,600,000 Fathers of Confederation Memorial Building, which will commemorate the first conference of the Fathers of Confederation in Charlottetown in 1864.

A provincial election on December 10 returned the Progressive Conservative government of Premier W. R. Shaw to its second term of office, with 19 members in the 30-seat legislature. The Liberals won the other 11 seats.

The construction industry was very active, with large rural high schools going up all over the province, several new commercial buildings erected in Charlottetown, and a large new provincial office building begun. A new car ferry, the "Confederation," commenced service from Borden to the mainland.

PRISONS

The year 1961 closed with 220,329 prisoners confined in federal and state institutions for adult offenders in the United States. This total represented a 3.4% increase over the 1960 figure of 213,125. The year-end total for state institutions was 196,633, and for federal institutions, 23,696.

The Western states experienced the largest proportionate increase in prisoner population, 7.8%. In the Northeastern states the number of prisoners went up by 3.5%; in the North Central states, 2.3%; and in the Southern states, 2.5%. The number of prisoners per 100,000 of the general civilian population of the nation was 121.7 (119.8 in 1960).

BUREAU OF PRISONS INSTITUTIONS
(Figures as of June 30, 1962)

Type of Institution	Population

Prisoners in transit	200

*To be closed by July 1963.

Research.—Greater emphasis was placed on research in the United States correctional field in 1962 than ever before. The most ambitious programs of research were carried out in the California and federal correctional systems. California's programs included two projects financed by the National Institute of Mental Health: a three-year study of parole board practices in setting terms of sentence and parole dates, and a three-year project to determine the effectiveness of group counseling and community living in rehabilitating male adult offenders. Among the manifold research activities of the federal system were studies of the effectiveness of community sponsors for institutionalized juvenile delinquents, and the relationship between the degree of program participation by inmates and their later adjustment in the community, the success of prerelease guidance centers in easing the community adjustments of youths and juveniles released from institutions, and the development of statistical techniques for studying prisoner population characteristics and trends. (See also CRIME.)

The National Council on Crime and Delinquency published a report summarizing 500 research projects, experiments, and program developments in the correctional field. Wisconsin's correctional system also published a report outlining over 30 research projects completed or under way in 1962. Among the significant studies in other state systems was a Texas project in which inmate volunteers were used to determine the effects of blood chemistry on mental illness and abnormal behavior.

Expansion of Facilities.—The success of the preparole "halfway houses" established by U.S. Attorney General Robert F. Kennedy in 1961 led to further development of this program in the federal corrections system and the adoption of the idea in several state systems. California converted a 2,200-inmate naval hospital into a center for the treatment of addicts formerly confined in state prisons. Indiana began building a new youth center. Ohio transferred several hundred prisoners from the overcrowded state reformatory to the newly completed Lebanon correctional institution. Texas broke ground for the construction of a 500-man diagnostic unit for the analytical study of inmates committed from the courts. Wisconsin reorganized and expanded its camp system. In the federal prison system the construction of a new maximum-security institution near Marion, Ill., neared completion; a replacement for the aged National Training School for Boys was being planned; and a new psychiatric hospital for prisoners was under design by architects.

Prison Discipline.—Few disorders occurred in 1962. At St. Vincent de Paul Federal Penitentiary in Montreal, Canada, 1,100 prisoners rioted on June 17 and destroyed most of the old maximum-security prison by fire. The riot had to be quelled by forces of prison guards, provincial police, the Royal Canadian Mounted Police, and army troops. At the District of Columbia's new youth center at Lorton, Va., inmates belonging to the violently antiwhite Black Muslim sect rioted on July 31. In New York, prisoners at the maximum security Sing Sing, Green Haven, Auburn, Clinton, and Attica prisons staged sit-down strikes on March 8–14, protesting the enactment of a stricter parole law. A minor riot broke out at a Kansas prison on August 11. Among other prison events which gained headlines were the escape of 25 inmates from a Georgia state prison branch (April 8), the escape from Alcatraz of three long-term bank robbers who perished in the waters of San Francisco Bay before they could reach the mainland (June 11), and the violent attempt of six murderers to force their way out of San Quentin's death row (July 2).

Commitments and Releases.—In 1961 court commitments numbered 93,590. The total of 80,073 offenders committed to state institutions represented a 6.8% increase over the 74,592 commitments in 1960. For federal institutions there were 13,517 commitments, compared with 13,723 in 1960.

There were 86,205 conditional and unconditional releases from state institutions in 1961, a 4.9% increase. In the federal system there were 14,519 releases, compared with 14,196 in 1960. Among the states, 51,445 (59.7%) of the releases were by parole; in the federal system, 4,380 (30%) were by parole.

UPI

Buildings at the St. Vincent de Paul federal penitentiary in Montreal are burned by inmates during riot on June 17.

Capital Punishment.—Fewer prisoners were executed by civil authorities in the United States in 1961 than in any year since the statistics on executions began in 1930. The 42 executions (as compared with 57 in 1960) involved 18 of the 44 jurisdictions (42 states, the District of Columbia, and the federal government) which still have capital punishment statutes. The executions included 8 in California, 5 each in South Carolina and Mississippi, 4 in Virginia, and 3 each in Georgia and Texas. Convictions for murder accounted for 33 executions, rape for 8, and kidnaping for 1. All 42 were men. On Jan. 1, 1962, 257 prisoners remained under sentence of death, over half of them in the states of California, Florida, Louisiana, Maryland, New York, Alabama, Illinois, and New Jersey. The youngest of those awaiting death was a 16-year-old boy in Georgia.

Legislation to abolish the death penalty received consideration in most of the jurisdictions in which it is still authorized, but little action was taken. The Delaware legislature overrode the governor's veto and reinstated the death penalty, which it had abolished in 1958, for first-degree murder, rape, kidnaping, and treason. The U.S. Congress amended the District of Columbia's statute providing a mandatory death penalty for first-degree murder, thus eliminating the last mandatory death penalty in the nation. The jury may now recommend life imprisonment for a defendant convicted of first-degree murder; if the jury disagrees, the court may choose to sentence the defendant either to death by electrocution or to life imprisonment.

J. V. BENNETT,
Director, Bureau of Prisons.

PRIZES AND AWARDS

Among the principal prizes and awards announced in 1962 are those in the following list, divided by subject. For other awards not listed here, see the Index entry, *Prizes and Awards.*

NOBEL PRIZES

Chemistry.—Drs. Max F. Perutz and John C. Kendrew, Cambridge University.

Literature.—John Steinbeck, American novelist.

Peace.—No award made.

Physics.—Dr. Lev. D. Landau, USSR Academy of Sciences.

Physiology and Medicine.—Prof. James D. Watson, Harvard University, Dr. Maurice H. F. Wilkins, King's College, London, and Dr. Francis H. C. Crick, Cambridge University.

The 1962 awards were equivalent to about $50,000 in each category. (See also NOBEL PRIZES.)

PULITZER PRIZES

Announced by the trustees of Columbia University on May 7, 1962, the Pulitzer Prize awards for 1961 were as follows:

Journalism.—Most distinguished and meritorious public service rendered by a United States newspaper: Panama City (Fla.) *News* and *Herald,* for their exposure of corruption. Distinguished local reporting (under pressure of edition time): Robert D. Mullins of the Salt Lake City *Deseret News,* for his coverage of a murder and kidnaping at Dead Horse Point, Utah. Distinguished local reporting (showing initiative and resourcefulness, not under pressure): George Bliss of the Chicago *Tribune,* for more than

80 articles on scandals in the Metropolitan Sanitary District of Greater Chicago. Distinguished reporting on national affairs: Nathan G. Caldwell and Gene S. Graham of the Nashville *Tennessean,* for six years' reporting on antitrust law violations in the coal industry. Distinguished reporting on international affairs: Walter Lippmann of the New York Herald Tribune Syndicate, for his long service to American journalism, including an interview with Nikita S. Khrushchev. Distinguished editorial writing: Thomas M. Storke of the Santa Barbara *News-Press,* for his exposure of a "campaign of hate and vilification" by the John Birch Society. Distinguished editorial cartoon: Edmund S. Valtman of the Hartford *Times,* for his cartoons during the year, including one of Fidel Castro's efforts to influence Brazilians. Outstanding news photography: Paul Vathis of the Associated Press, for a photograph of John F. Kennedy and Dwight D. Eisenhower.

Letters.—Fiction in book form: Edwin O'Connor, for *The Edge of Sadness.* American play: Frank Loesser and Abe Burrows, for *How to Succeed in Business Without Really Trying.* Book on United States history: Lawrence H. Gipson, for *The Triumphant Empire: Thunder-Clouds Gather in the West.* American biography: no award made. Volume of verse: Alan Dugan, for *Poems.* Nonfiction: Theodore H. White, for *The Making of the President, 1960.*

Music.—Robert Ward, for *The Crucible.*

Art, Music, and Dance

Benjamin Altman prizes ($2,000): Ben Kamihira, for figure painting; Paul Sample, for landscape painting.

American Academy of Arts and Letters Award of Merit (gold medal and $1,000): Charles Sheeler.

American Institute of Architects Gold Medal: The late Eero Saarinen.

American Institute of Graphic Arts Medal: Willem Sandberg.

Art in America Award (medal and $1,000) for 1962: Alfred H. Barr, Jr., and Alexander Calder.

Audubon Artists gold medals of honor: Alfred Blaustein, for graphic arts; Doris Wainwright Kennedy, for water color; Ethel Magafan, for painting; Helen Louise Wilson, for sculpture.

Dance Magazine awards: Melissa Hayden, Anna Sokolow, and Gwen Verdon.

Alice M. Ditson Award ($1,000) for "distinguished service to American music": Guy Fraser Harrison.

Kaufmann International Design Award ($20,000) for 1961: Walter Gropius.

National Institute of Arts and Letters awards: Award for Distinguished Service to the Arts—Paul Mellon; Arnold W. Brunner Memorial Prize ($1,000) in architecture—Ulrich Franzen; Richard and Hinda Rosenthal Award for painting ($2,000)—Robert Andrew Parker; Marjorie Peabody Waite Award ($1,000)—Abraham Walkowitz.

National Sculpture Society awards: Gold Medal—Donald De Lue; Herbert Adams Memorial medals—Paul Fjelde, Pietro Montana, and Wheeler Williams.

New York Music Critics Circle citations for 1961–62: Chamber music—Arthur Berger, for his Quartet; Elliott Carter, for his Double Concerto for Piano, Harpsichord, and Chamber Orchestra; choral work—no citation made; opera—Benjamin Britten, for *The Turn of the Screw;* Robert Ward, for *The Crucible;* orchestra work—no citation made.

Venice Biennale first prizes (2,000,000 lire): Alfred Manessier, for painting; Alberto Giacometti, for sculpture.

Journalism

F. Wayland Ayer Cup for mechanical excellence in journalism: *Christian Science Monitor.*

Heywood Broun Memorial Award ($500) for 1961: Dale Wright and Michael Mok, New York *World-Telegram and Sun.*

Maria Moors Cabot awards for "advancement of international friendship and understanding in the Americas": Raúl Fontaina, general manager, Radio Carve, Montevideo; John R. Herbert, editor, Quincy *Patriot Ledger;* Rodolfo Junco de la Vega, publisher, *El Norte* and *El Sol,* Monterrey; John S. Knight, president, Knight Newspapers, Inc.

Raymond Clapper Memorial Award ($1,000) for 1961: Richard Fryklund, Washington *Star.*

Columbia-Catherwood awards for international journalism: Michel Gordey, *France-Soir,* Paris; Quincy Howe, American Broadcasting Company.

Albert Lasker Medical Journalism awards ($2,500) for 1961: Michael Mok, for articles on mental illness in the New York *World-Telegram and Sun;* Gilbert Cant, for an article on viruses in *Time;* Station WBAL-TV, Baltimore, for a program on mental retardation.

Overseas Press Club awards for 1961: E. W. Fairchild Award—Edwin L. Dale, Jr., New York *Times;* George Polk Memorial Award—Dickey Chapelle, *Reader's Digest;* Ed Stout Award—Juan de Onis, New York *Times;* press reporting from abroad—Robert Considine, Hearst Headline Service; press interpretation of foreign affairs—Phil Newsom, United Press International; radio reporting from abroad—Marvin Kalb, Columbia Broadcasting System; radio interpretation of foreign affairs—Howard K. Smith, American Broadcasting Company; television reporting from abroad—Helen G. Rogers and William Hartigan, American Broadcasting Company; television interpretation of foreign affairs—David Schoenbrun and George Vicas, Columbia Broadcasting System; magazine reporting of foreign affairs—Charles J. V. Murphy, *Fortune;* book on foreign affairs—John Toland, for *But Not in Shame;* still photographic reporting from abroad—Peter Leibing, Associated Press; film reporting from abroad—Leonard Stark and Nobuo Hoshi, National Broadcasting Company.

George Polk Memorial awards for 1961: Foreign reporting—Morris H. Rubin, *Progressive;* national reporting—Gerard Piel, *Scientific American;* local reporting—Laurence Stern, Washington *Post;* radio and television reporting—Robert Young and Charles Dorkins, National Broadcasting Company; news photography—anonymous photographer of a cable car disaster in the French Alps on Aug. 29, 1961; community service—Arnold Brophy and Joseph S. Gelmis, *Newsday;* special award—Jules Feiffer, cartoonist, for his "insights into the frustrations of modern man."

Letters

Academy of American Poets awards: Fellowship Award ($5,000) for distinguished poetic achievement—John Crowe Ransom; Lamont Poetry Selection—Edward Field, for *Stand Up, Friend, with Me.*

American Council of Learned Societies prizes ($10,000): Kenneth E. Boulding, University of Michigan; John K. Fairbank and Harry Levin, Harvard University; Erwin R. Goodenough, Filmer S. C. Northrop, and C. Vann Woodward, Yale University; Robert K. Merton and Marjorie H. Nicolson, Columbia University; Alexander C. Soper, Bryn Mawr College and New York University; Owsel Temkin, Johns Hopkins University.

American Library Association awards: Caldecott Medal—Marcia Brown, for *Once a Mouse;* Clarence Day Award ($1,000)—Lillian H. Smith, Toronto Public Library; Grolier Society Award ($500)—Alice Brooks McGuire, Casis Elementary School, Austin, Texas; Joseph W. Lippincott Award (medal and $1,000)—David H. Clift, American Library Association; John Newbery Medal—Elizabeth George Speare, for *The Bronze Bow.*

Bancroft prizes ($4,000) of Columbia University for distinguished writings in American history, diplomacy, or international relations for 1961: Lawrence A. Cremin, for *The Transformation of the School;* Martin B. Duberman, for *Charles Francis Adams, 1807–1886;* Felix Gilbert, for *To the Farewell Address.*

Bollingen Prize in Poetry ($2,500) for 1961: Richard Eberhart, for the body of his work, and John Hall Wheelock, for *The Gardener and Other Poems.*

Carey-Thomas Award for the best example of creative publishing: Belknap Press of the Harvard University Press, for *The Diary and Autobiography of John Adams.*

Emerson-Thoreau Award (medal and $1,000) of the American Academy of Arts and Sciences: Katherine Anne Porter.

Governor General's awards to Canadians for the best books of 1961: English fiction—the late Malcolm Lowry, for *Hear Us O Lord from Heaven Thy Dwelling Place;* English nonfiction—Thomas A. Goudge, for *The Ascent of Life;* English poetry—Robert Finch, for *Acis in Oxford and Other Poems;* French fiction—Yves Thériault, for *Ashini;* French nonfiction—Jean Le Moyne, for *Convergences;* French poetry—no award made.

Harper Prize Novel ($10,000) for 1963: Richard McKenna, for *The Sand Pebbles.*

MacDowell Colony Medal: Robert Frost.

John P. Marquand First Novel Award ($10,000) of the Book-of-the-Month Club: Joan Williams, for *The Morning and the Evening.*

National Book awards ($1,000): Fiction—Walker Percy, for *The Moviegoer;* nonfiction—Lewis Mumford, for *The City in History;* poetry—Alan Dugan, for *Poems.*

National Institute of Arts and Letters awards: Gold Medal for Fiction—the late William Faulkner (q.v.); Gold Medal for History and Biography—Samuel Eliot Morison; Russell Loines Memorial Award for poetry ($1,000)—I. A. Richards; Richard and Hinda Rosenthal Award for a novel ($2,000)—Paule Marshall, for *Soul Clap Hands and Sing.*

Francis Parkman Prize (medal and $500) of the Society of American Historians: Leon Wolff, for *Little Brown Brother.*

Henry M. Phillips Prize ($2,000) of the American Philosophical Society: The late K. N. Llewellyn, University of Chicago.

Edgar Allan Poe awards of the Mystery Writers of America for 1961: Best mystery novel—J. J. Marric (pseudonym of John Creasey), for *Gideon's Fire;* best first mystery novel—Suzanne Blanc, for *The Green Stone;* best short story—Avram Davidson, for *The Affair at Lahore Cantonment;* best fact crime writing—Barrett Prettyman, for *Death and the Supreme Court;* best juvenile mystery—Edward Fenton, for *The Phantom of Walkaway Hill;* special awards—Erle Stanley Gardner and Thomas M. McDade.

Poetry Society of America awards: Melville Cane Award ($500)—Richard Wilbur, for *Advice to a Prophet and Other Poems;* Robert Frost Poetry Award ($1,000)—William D. Barney; Medal for Distinguished Service—Maurice E. Peloubet; Shelley Memorial Award ($1,250)—Theodore Roethke.

Prix Femina: Yves Berger, for *Le sud.*

Prix Goncourt: Anna Langfus, for *Les bagages de sable.*

Prix Interallié: Henri François Rey, for *Les pianos mécaniques.*

Prix Médicis: Colette Audry, for *Derrière la baignoire.*

Prix Théophraste Renaudot: Simonne Jacquemard, for *Le veilleur de nuit.*

Kenneth Roberts Memorial Award ($5,000): Page Smith, for *John Adams.*

Woodrow Wilson Foundation Award ($1,000) of the American Political Science Association: Robert A. Dahl, for *Who Governs? Democracy and Power in an American City.*

Radio and Television

Academy of Television Arts and Sciences awards for 1961–62: Best program of the year—*Victoria Regina;* best single dramatic performances—Julie Harris, in *Victoria Regina;* Peter Falk, in *The Price of Tomatoes;* best performances in a dramatic series—Shirley Booth, in *Hazel;* E. G. Marshall, in *The Defenders;* best variety performance—Carol Burnett, in *The Garry Moore Show;* best supporting performances—Pamela Brown, in *Victoria Regina;* Don Knotts, in *The Andy Griffith Show;* best children's program—*Young People's Concerts;* best daytime program—*Purex Specials for Women;* best dramatic program—*The Defenders;* best educational and public affairs program—*David Brinkley's Journal;* best humorous program—*The Bob Newhart Show;* best musical program—New York Philharmonic in Japan; best news reporting program—*Huntley-Brinkley Report;* best variety program—*The Garry Moore Show;* best original music—Richard Rodgers, for *Winston Churchill: the Valiant Years;* best comedy writing—Carl Reiner, for *The Dick Van Dyke Show;* best documentary writing—Lou Hazam, for *Vincent Van Gogh: a Self-Portrait;* best dramatic writing—Reginald Rose, for *The Defenders;* best art direction and scenic design—Philip Barber, for *The Twilight Zone;* best comedy direction—Nat Hiken, for *Car 54, Where Are You?;* best dramatic direction—Franklin Schaffner, for *The Defenders;* best cinematography for television—John S. Priestley, for *Naked City;* best editing of a film for television—Aaron Nibley and Hugh Chaloupka, for *Naked City;* best electronic camera work—*The Ernie Kovacs Show;* best engineering or technical achievement—American Broadcasting Company, for a slow-motion video tape process; trustees' special awards—Lt. Col. John H. Glenn, Jr., American Broadcasting Company, Columbia Broadcasting System, and National Broadcasting Company, for the space flight of Feb. 20, 1962; Mrs. John F. Kennedy and the Columbia Broadcasting System, for *A Tour of the White House;* David Sarnoff.

Monte Carlo International Television Festival First Prize: *Pablo Casals' Master Class.*

George Foster Peabody awards for 1961: *Radio.*—Station WRUL, Worldwide Broadcasting, cited for contribution to international understanding (broadcasts of the UN General Assembly); Station WNYC, New York, best educational programs (*The Reader's Almanac* and *Teen Age Book Talk*); Station WFMT, Chicago, best entertainment (*Fine Arts Entertainment*); Capital Cities Broadcasting Corporation, special award, for *Verdict for Tomorrow: the Eichmann Trial on Television. Television.*—Walter Lippmann, cited for contribution to international understanding; *An Age of Kings* and *Vincent Van Gogh: a Self-Portrait,* best educational programs; *The Bob Newhart Show,* best entertainment; *David Brinkley's Journal,* best news program; *Let Freedom Ring,* cited for public service; *Expedition,* best youth and children's program; Newton N. Minow and Fred W. Friendly, special awards.

Science and Technology

American Cancer Society Award: Elmer H. Bobst, Warner-Lambert Pharmaceutical Company.

American Chemical Society awards: Roger Adams Award in Organic Chemistry ($5,000)—Dr. Paul D. Bartlett, Harvard University; ACS Award for Creative Work in Synthetic Organic Chemistry ($1,000)—Dr. Nelson J. Leonard, University of Illinois; ACS Award for Nuclear Applications ($1,000)—Dr. Martin D. Kamen, University of California; ACS Award for Outstanding Work in Inorganic Chemistry ($1,000)—Dr. Daryle H. Busch, Ohio State University; ACS Award in Biological Chemistry ($1,000)—Dr. William P. Jencks, Brandeis University; ACS Award in Chemical Education ($1,000)—Dr. Edward L. Haenisch, Wabash College; ACS Award in Chemical Instrumentation ($1,000)—Dr. Howard V. Malmstadt, University of Illinois; ACS Award in Chromatography and Electrophoresis ($1,000)—Dr. Walter E. Cohn, Oak Ridge National Laboratory; ACS Award in Industrial and Engineering Chemistry ($1,000)—Dr. Manson Benedict, Massachusetts Institute of Technology; ACS Award in Petroleum Chemistry ($1,000)—Dr. John P. McCullough, U.S. Bureau of Mines; ACS Award in Pure Chemistry ($1,000)—Dr. Stuart A. Rice, University of Chicago; ACS Award in the Chemistry of Milk ($1,000)—Dr. Serge N. Timasheff, U.S. Department of Agriculture; Peter Debye Award in Physical Chemistry ($2,000)—Dr. Robert S. Mulliken, University of Chicago; Fisher Award in Analytical Chemistry ($1,000)—Dr. David N. Hume, Massachusetts Institute of Technology; Fritzsche Award ($1,000) for work in essential oils—Dr. Arthur J. Birch, University of Manchester; Garvan Medal—Dr. Mildred Cohn, University of Pennsylvania; Willard Gibbs Medal—Dr. Paul D. Bartlett, Harvard University; Charles Goodyear Medal—Dr. William J. Sparks, Esso Research and Engineering Company; James T. Grady Medal—Lawrence Lessing, *Fortune;* Kendall Company Award in Colloid Chemistry ($1,000)—Dr. William A. Zisman, U.S. Naval Research Laboratory; Frederic Stanley Kipping Award in Organosilicon Chemistry ($1,000)—Dr. Leo H. Sommer, Pennsylvania State University; Paul-Lewis Laboratories Award in Enzyme Chemistry ($1,000)—Dr. Charles Gilvarg, New York University; Priestley Medal—Dr. Peter J. W. Debye, Cornell University.

American Geographical Society awards: Cullum Geographical Medal—Dr. Richard J. Russell, Louisiana State University; Charles P. Daly Medal—O. M. Miller, American Geographical Society.

American Heart Association awards: Gold Heart awards—Dr. Irvine H. Page, Cleveland Clinic Foundation; Sylvester L. Weaver, McCann-Erickson Corporation, International; Dr. Robert W. Wilkins, Boston University; Research Achievement Award ($1,000)—Dr. Maurice B. Visscher, University of Minnesota.

American Institute of Chemists Gold Medal: Dr. W. George Parks, University of Rhode Island.

American Institute of Electrical Engineers awards: Edison Medal—Dr. Alexander C. Monteith, Westinghouse Electric Corporation; Benjamin G. Lamme Gold Medal—Charles Concordia, General Electric Company.

American Medical Association Scientific Achievement Award: Dr. Donald D. Van Slyke, Brookhaven National Laboratory.

American Public Health Association awards: Bronfman prizes ($5,000)—Dr. José Álvarez Amézquita, Mexican secretary of public health and welfare; Prof. Theodore F. Hatch, University of Pittsburgh; Dr. Charles E. Smith, University of California; Sedgwick Memorial Medal—Dr. Ira V. Hiscock, Yale University.

American Society of Mechanical Engineers awards: ASME Medal—Dr. Philip Sporn, American Electric Power

Among winners of Pulitzer Prizes for 1962, announced on May 7, were: ***(left to right)*** **Abe Burrows, coauthor with Frank Loesser of the musical comedy *How to Succeed in Business Without Really Trying*, drama; Edwin O'Connor, for *The Edge of Sadness*, fiction; Theodore H. White, *The Making of the President, 1960*, nonfiction; and Robert Ward, *The Crucible*, music.**

WIDE WORLD

U.P.I.

Dr. Edward Teller (center), a pioneer in thermonuclear research, is presented the Enrico Fermi Award by President Kennedy in Washington, December 3, as Mrs. Teller watches.

Company; Daniel Guggenheim Medal—the late James H. Kindelberger, North American Aviation, Inc.; Hoover Medal—Walker L. Cisler, Detroit Edison Company; George Westinghouse Gold Medal—Edwin H. Krieg, Stone and Webster Engineering Corporation.

Borden Award (gold medal and $1,000) of the Association of American Medical Colleges: Dr. Leon O. Jacobson, University of Chicago.

Oliver E. Buckley Solid-State Physics Prize ($1,000) of the American Physical Society: Dr. Bertram N. Brockhouse, Atomic Energy of Canada, Ltd.

Robert J. Collier Trophy for 1961: Scott Crossfield, North American Aviation, Inc.; Comdr. Forrest Peterson, U.S. Navy; Joseph Walker, National Aeronautics and Space Administration; Maj. Robert M. White, U.S. Air Force.

Albert Einstein Award (gold medal and $5,000) of the Lewis and Rosa Strauss Memorial Fund: Dr. Shields Warren, Harvard Medical School.

Enrico Fermi Award (gold medal and $50,000): Dr. Edward Teller, University of California.

Franklin Medal of the Franklin Institute: Sir Geoffrey I. Taylor, Cambridge University.

Geological Society of America awards: Arthur L. Day Medal—Dr. Hatten S. Yoder, Jr., Geophysical Laboratory, Carnegie Institution of Washington; Penrose Medal—Dr. Alfred S. Romer, Harvard University.

Guggenheim International Astronautics Award ($1,000): Dr. James A. Van Allen, State University of Iowa.

Industrial Research Institute Medal for 1963: Dr. James B. Fisk, Bell Telephone Laboratories.

Institute of Radio Engineers Medal of Honor for 1963: Dr. John H. Hammond, Jr., Hammond Research Corporation; Dr. George C. Southworth, Bell Telephone Laboratories.

Institute of the Aerospace Sciences awards: Octave Chanute Award—Neil A. Armstrong; Lewis H. Hill Space Transportation Award—Robert R. Gilruth, National Aeronautics and Space Administration; John Jeffries Award—Dr. Ashton Graybiel, Naval School of Aviation Medicine; Robert M. Losey Award—Arthur F. Merewether, American Airlines, Inc.; Sylvanus Albert Reed Award—Dr. Alfred J. Eggers, Jr., National Aeronautics and Space Administration; Lawrence B. Sperry Award—Douglas G. Harvey, Martin Marietta Corporation.

Langley Gold Medal of the Smithsonian Institution: Dr. Hugh L. Dryden, National Aeronautics and Space Administration.

Albert Lasker awards in medical research ($10,000): Dr. C. H. Li, University of California; Dr. Joseph E. Smadel, National Institutes of Health.

Ernest O. Lawrence Memorial awards (medal and $5,000): Dr. Andrew A. Benson, University of California, Los Angeles; Dr. Richard P. Feynman, California Institute of Technology; Dr. Herbert Goldstein, Columbia University; Dr. Anthony Turkevich, University of Chicago; Dr. Herbert F. York, University of California, San Diego.

Mathematical Association of America Award for Distinguished Service to Mathematics ($500): Dr. Mina Rees, City University of New York.

National Academy of Sciences awards: Alexander Agassiz Medal—Dr. George E. R. Deacon, British National Institute of Oceanography; Award in Molecular Biology—Dr. Marshall W. Nirenberg, National Institutes of Health; John J. Carty Medal—Dr. Charles H. Townes, Massachusetts Institute of Technology; Daniel Giraud Elliot Medal—Dr. Donald R. Griffin, Harvard University; Kimber Genetics Medal—Dr. Milislav Demerec, Brookhaven National Laboratory; Jessie Stevenson Kovalenko Medal—Dr. George H. Whipple, University of Rochester; Public Welfare Medal—Dr. James A. Shannon, National Institutes of Health; J. Lawrence Smith Medal—Dr. Harold C. Urey, University of California, San Diego; Charles Doolittle Walcott Medal—Dr. Armin A. Opik, Australian Bureau of Mineral Resources.

National Geographic Society awards: Hubbard Medal—Lt. Col. John H. Glenn, Jr., U.S. Marine Corps; Gen. Thomas D. White Space Trophy—Capt. Virgil I. Grissom, U.S. Air Force.

Royal Geographical Society Medal: Capt. Edwin A. McDonald, U.S. Navy.

Royal Medal of the Royal Society: Dr. Subrahmanyan Chandrasekhar, University of Chicago.

Trudeau Medal of the National Tuberculosis Association: Dr. John D. Steele, San Fernando Veterans Administration Hospital.

United Nations awards ($10,000) for cancer research: Dr. W. R. S. Doll, British Medical Research Council; Dr. Ludwik Gross, Bronx Veterans Administration Hospital; Dr. Wilhelm C. Hueper, National Cancer Institute; Dr. Leon M. Shabad, USSR Academy of Medical Sciences; Dr. Antoine Lacassagne, Radium Institute, Paris; the late Dr. George N. Papanicolaou, Papanicolaou Cancer Research Institute, Miami; Dr. Peyton Rous, Rockefeller Institute.

Viking Fund Award (medal and $10,000) of the Wenner-Gren Foundation for Anthropological Research, Inc.: Dr. Edward E. Evans-Pritchard, Oxford University; Dr. Robert von Heine-Geldern, Austrian Academy of Science; Dr. Louis S. B. Leakey, Coryndon Memorial Museum, Nairobi; Dr. Sol Tax, University of Chicago.

William H. Walker Award of the American Institute of Chemical Engineers: Dr. Robert B. Bird, University of Wisconsin.

Wright Brothers Medal of the Society of Automotive Engineers for 1961: C. M. Mears, Hughes Aircraft Company; R. L. Peterson, North American Aviation, Inc.

Theater and Motion Pictures

Academy of Motion Picture Arts and Sciences awards for 1961: Best picture of 1961—*West Side Story;* best film actress—Sophia Loren (q.v.), for her performance in *Two Women;* best film actor—Maximilian Schell (q.v.), for his performance in *Judgment at Nuremberg;* best director—Jerome Robbins and Robert Wise, for *West Side Story;* best supporting actress—Rita Moreno, in *West Side Story;* best supporting actor—George Chakiris, in *West Side Story;* best foreign-language film—*Through a Glass Darkly* (Swedish); best feature documentary film—*The Sky Above and the Mud Below;* best story and screenplay—William Inge, for *Splendor in the Grass;* best screen adaptation—Abby Mann, for *Judgment at Nuremberg;* best original song—*Moon River* (Henry Mancini and Johnny Mercer); best music scoring (drama or comedy)—Henry Mancini, for *Breakfast at Tiffany's;* best music scoring (musical)—Saul Chaplin, Johnny Green, Sid Ramin, and Irwin Kostal, for *West Side Story;* best cinematography (black and white)—Gene Shufton, for *The Hustler;* best cinematography (color)—Daniel L. Fapp, for *West Side Story;* best art direction (black and white)—Harry Horner, for *The Hustler;* set direction by Gene Callahan; best art direction (color)—Boris Leven, for *West Side Story;* set direction by Victor Gangelin; best special effects—Bill Warrington and John Cox, for *The Guns of Navarone;* best costume design (black and white)—Piero Gherardi, for *La dolce vita;* best costume design (color)—Irene Sharaff, for *West Side Story;* best film editing—Thomas Stanford, for *West Side Story;* best sound recording—*West Side Story;* best documentary short subject—*Project Hope;* best live-action short subject—*Seawards the Great Ships;* best cartoon short subject—*Ersatz;* special awards—Bill L. Hendricks, Stanley Kramer (Irving C. Thalberg Award), Fred L. Metzler, Jerome Robbins, and George Seaton (Jean Hersholt Humanitarian Award).

American Academy of Dramatic Arts Award of Merit: Rosalind Russell.

Barter Theater Award: Abe Burrows, for coauthorship and direction of *How to Succeed in Business Without Really Trying.*

British Film Academy awards for 1961: Best film—*The Hustler* and *Ballad of a Soldier;* best British film—*A Taste of Honey;* best British actress—Dora Bryan, for her performance in *A Taste of Honey;* best non-British actress—Sophia Loren (q.v.), for her performance in *Two Women;* best British actor—Peter Finch, for his performance in *No Love for Johnnie;* best non-British actor—Paul Newman, for his performance in *The Hustler;* United Nations Award—*Let My People Go.*

Cannes International Film Festival awards: Golden Palm—*The Given Word* (Brazilian); Second Prize—*Eclipse* (Italian) and *The Trial of Joan of Arc* (French); best acting—Katharine Hepburn, Sir Ralph Richardson, Jason Robards, Jr., and Dean Stockwell, for their performances in *Long Day's Journey into Night* (American); Rita Tushingham and Murray Melvin, for their performances in *A Taste of Honey* (British); best documentary film—*Owl Creek* (French); best film adaptation—*Electra* (Greek); best film comedy—*Divorce—Italian Style* (Italian); Special Jury prizes—*Pan* (Dutch) and *The Wait* (Polish); International Film Critics Award—*The Exterminating Angel* (Mexican); Roman Catholic Film Office Award—*The Trial of Joan of Arc.*

Clarence Derwent awards ($500) for the best non-featured performances in 1961–62: Rebecca Darke, for her performance in *Who'll Save the Plowboy?;* Gene Wilder, for his performance in *The Complaisant Lover.*

Directors Guild of America awards for 1961: Best

motion picture director—Jerome Robbins and Robert Wise, for *West Side Story;* best television director—the late Ernie Kovacs, for *Ernie Kovacs Special;* best critic—John Beaufort, *Christian Science Monitor.*

Robert J. Flaherty Award for creative achievement in documentary films: *The Brigands* (Italian).

Milestone Award of the Screen Producers Guild: Bob Hope, award for 1961; Irving Berlin, award for 1962.

New York Drama Critics Circle awards: *The Night of the Iguana,* best American play of the 1961–62 season; *A Man for All Seasons,* best foreign play; *How to Succeed in Business Without Really Trying,* best musical.

Antoinette Perry awards for 1961–62: *A Man for All Seasons,* play by Robert Bolt; *How to Succeed in Business Without Really Trying,* musical based on a book by Shepherd Mead, with book by Abe Burrows, Jack Weinstock, and Willie Gilbert, and music and lyrics by Frank Loesser; Margaret Leighton (q.v.), for her performance in *The Night of the Iguana;* Paul Scofield (q.v.), for his performance in *A Man for All Seasons;* Anna Maria Alberghetti, for her performance in *Carnival;* Diahann Carroll, for her performance in *No Strings;* Robert Morse and Charles Nelson Reilly, for their performances in *How to Succeed in Business Without Really Trying;* Elizabeth Ashley, for her performance in *Take Her, She's Mine;* Walter Matthau, for his performance in *A Shot in the Dark;* Phyllis Newman, for her performance in *Subways Are for Sleeping;* Noel Willman, for direction, and Michael Burns, for work as stage technician, of *A Man for All Seasons;* Abe Burrows, for direction, and Elliott Lawrence, for musical direction and conducting, of *How to Succeed in Business Without Really Trying;* Richard Rodgers, for musical composition, and Joe Layton, for choreography, of *No Strings;* Will Steven Armstrong, for scenic design of *Carnival;* Lucinda Ballard, for costumes of *The Gay Life;* Agnes de Mille, for choreography of *Kwamina;* Brocks Atkinson, Richard Rodgers, and Franco Zeffirelli, special awards.

Venice International Film Festival awards: Golden Lion of St. Mark—*Childhood of Ivan* (Russian) and *Family Chronicle* (Italian); best actress—Emmanuelle Riva, for her performance in *Thérèse Desqueyroux* (French); best actor—Burt Lancaster, for his performance in *Bird Man of Alcatraz* (American); best first feature film by a new director—*David and Lisa* (American) and *The Flood Victims* (Argentinian); Special Jury Prize—*To Live One's Life* (French); City of Venice Prize and Cineforum Award—*Family Chronicle;* Roman Catholic Film Office Award—*Term of Trial* (British); San Giorgio Prize—*Bird Man of Alcatraz.*

MISCELLANEOUS

American Federation of Labor and Congress of Industrial Organizations Award ($5,000): Luis Muñoz Marín.

America's Democratic Legacy Award of the Anti-Defamation League of B'nai B'rith: Adlai E. Stevenson.

Balzan Prize (1,000,000 Swiss francs) for a "major contribution to peace and humanity": Nobel Foundation.

Erasmus Prize (100,000 guilders) for 1961–62 for outstanding work in the European spirit: Prof. Romano Guardini, University of Munich.

Freedom Award of Freedom House: Jean Monnet.

Harmon International Aviation trophies: Lt. Col. William R. Payne, U.S. Air Force; Jacqueline Cochran; Comdr. Malcolm D. Ross, U.S. Navy; the late Lt. Comdr. Victor E. Prather, U.S. Navy.

Laetare Medal of the University of Notre Dame: Dr. Francis J. Braceland, Yale University.

Florina Lasker Award ($1,000) in social welfare: Mr. and Mrs. Karl de Schweinitz.

Nansen Medal for outstanding services to refugees: Sir Tasman Heyes.

National Brotherhood awards of the National Conference of Christians and Jews: Gen. Lucius D. Clay and President John F. Kennedy.

National Institute of Social Sciences gold medals: Dr. Ralph R. Bunche, Mrs. Mary I. Bunting, Gen. Lucius D. Clay, and Dr. John W. Gardner.

President's Award for Distinguished Federal Civilian Service: J. Stanley Baughman, Robert R. Gilruth, Dr. Donald E. Gregg, Dr. Frances Oldham Kelsey, Waldo K. Lyon, and Llewellyn E. Thompson.

Rockefeller Public Service awards ($5,000) for 1962: J. Stanley Baughman, Reginald G. Conley, Dr. Hugh L. Dryden, Morris H. Hansen, and Llewellyn E. Thompson.

Theodore Roosevelt medals for distinguished service: Arthur H. Dean, Lt. Col. John H. Glenn, Jr., and the late Stanley M. Isaacs.

Walter W. Van Kirk Award for Christian Stewardship of the National Council of Churches: Andrew W. Cordier.

George Washington Award (medal and $5,000) of the Freedoms Foundation: J. Edgar Hoover.

Stephen S. Wise Award of the American Jewish Congress: Robert F. Kennedy.

PROTESTANT EPISCOPAL CHURCH

The most significant event of 1962, if not of the decade, in all Christendom was the convening in October of the Second Vatican Ecumenical Council. There has been a trend in recent years toward opening broader official lines of communications between the Vatican and other Christian sects, as exemplified by the visits to the pope by the archbishop of Canterbury and the American presiding bishop, and the presence of Roman Catholic observers at the Third Assembly of the World Council of Churches meeting in late 1961 in New Delhi, India. This was demonstrated further by the Vatican's invitation to non-Roman churches to send observer-delegates to the council. Of the three Anglicans appointed by the archbishop of Canterbury, one was an American, the Rev. Frederick C. Grant, distinguished Biblical scholar and professor emeritus of Union Theological Seminary, New York, N.Y. The other two Anglicans were the bishop of Ripon, well-known Church of England historian, and the archdeacon of Ceylon. Prior to the opening of the Vatican Council, the presiding bishop, the Rt. Rev. Arthur Lichtenberger, called upon Episcopalians to pray constantly for the council.

The annual meeting of the House of Bishops, which opened on October 27 in Columbia, S.C., welcomed the newly enthroned archbishop of Canterbury, the Most Rev. Arthur Michael Ramsey, visiting the United States for the first time. The bishops set forth, in lieu of a pastoral letter, four separate statements touching on crucial issues in our day: race relations, new movements in the church, Christian unity, and war and peace.

Two new missionary bishops were elected: Eduardo G. Longid, the first Filipino to be ordained by the Episcopal Church, was named the second suffragan bishop of the Philippines, and the Rev. Cedric E. Mills was named first bishop of the Virgin Islands. This recently created jurisdiction was enlarged by the addition of the British Virgin Islands to the Virgin Islands of the United States as a result of the transfer of jurisdiction from the English to the American church.

Among the many notable Episcopal events of 1962 were the following: The first conversations on Christian unity between representatives of the Episcopal, United Presbyterian, and Methodist churches, and the United Church of Christ were held in April in Washington, D.C., and the conferees agreed to continue the conversations and to invite three additional churches to join in future discussions. Episcopalians shared in "Christian Witness in Century 21" at the Seattle World's Fair. The church in the Hawaiian Islands observed the hundredth anniversary of its beginnings. And the concordat between the Episcopal Church and the Philippine Independent Church approved by the 1961 General Convention was formally instituted in May on the occasion of the presiding bishop's visit to Manila.

The president of the National Council of the Episcopal Church is the presiding bishop, the Rt. Rev. Arthur Lichtenberger. The national headquarters, for more than 65 years at Church Missions House, 281 Park Avenue South, New York 10, N.Y. was to move in late February 1963 to a new Episcopal Church Center at 815 Second Avenue, New York 17, N.Y.

WILLIAM E. LEIDT,
Director of Publications, National Council, Protestant Episcopal Church.

PSYCHIATRY AND MENTAL HEALTH

The year 1962 saw further development of services and research as in previous years without recording a significant breakthrough or change.

A milestone on the international scene, was the first Pan-African Conference held in Abeokuta, Nigeria, in November 1961. This important congress was attended by leading psychiatrists of the world, who learned about African problems and methods of treatment while stimulating psychiatric education and research throughout the continent, particularly in Nigeria and other independent areas.

Increasing individual travel to and from foreign countries, including eastern Europe, furthered mutual understanding and cross-fertilization of ideas, especially where research was concerned. In both Poland and the Soviet Union in 1962, research of the highest refinement into the nature and character of reflex mechanism continued, and clinicians in those countries were interested in some Western methods of treatment not identified as "Freudian." At the Tri-Annual All Scandinavian Congress for Psychiatry, it became apparent that while academic psychiatry in Scandinavia remained primarily oriented in a biological direction with continuing constructive work in genetics, treatment programs in hospitals and in the community were catching up with the standards set in England and the Netherlands. The First International Congress of Psychosomatic Medicine and Childbirth convened in Paris in July 1962. The majority of contributions from France and the United States were concerned with the emotional aspects of labor and obstetrical management. There were papers from many countries on educational preparation for parturition.

Developments in the United States.—In the United States the number of hospital beds occupied continued to decline, despite increasing admission rates during 1961–62, as had been the case for several years previously. The reasons for the excess of hospital discharges over admissions within a given year remained a matter of controversy, and careful studies of pertinent figures in California showed that the introduction of the tranquilizing agents was not the only factor related to this development, as the trend existed whether or not drugs were employed. Readmission rates also declined, and again many factors were involved, such as better community service in dispensing medication to discharged patients, as well as improvements in other community services.

Action for Mental Health (1961), the final report of the congressional Joint Commission on Mental Illness and Health, also led to controversy in 1962 as national organizations such as the American Public Health Association, the American Medical Association, the American Psychiatric Association, and others discussed the report at annual or special meetings. Although implementation did not necessarily take the course proposed by the commission, the discussions stimulated much work on planned new services and research projects.

Many of these discussions centered on use of manpower and economic sources, on integration of hospital and community services, or on preventive efforts versus treatment and the like. The more fundamental problem of a radical change in psychiatric practice toward treating psychotic instead of neurotic patients was hardly discussed. The American Medical Association, however, which organized a conference on Mental Illness and Health in October 1962, was told authoritatively that psychiatric hospitalization was simply a phase in the course of psychiatric treatment; that psychiatric institutions must end their mental, economic and geographic isolation; and that the job was one for the entire profession. The evidence clearly indicated that psychiatric care in the form of integrated inpatient and outpatient services for psychotics had made more progress under the government-supported systems of medical care in the United Kingdom, the Netherlands, and other countries than in the United States.

Congressional appropriations in 1962 for the National Institute of Mental Health stood at $143,599,000, an increment of $35,000,000 over 1961. Included in the sum was $4,200,000 to be allocated to the states to study and formulate plans for implementation of the commission report.

Research and Training.—Family research and treatment of the family as a unit have so advanced that a new publication called *Family Research* was introduced in 1962. Family treatment, which has some similarities to group therapy, is particularly indicated for the families of hospitalized patients to alleviate their stress and to facilitate the patient's rehabilitation after he leaves the hospital. The importance and effectiveness of such procedures have also been pointed up abroad, especially in psychiatric emergencies.

Physiological and biochemical research in the United States, in Europe, and behind the Iron Curtain continued on a broad front in 1962 without any startling discoveries. Important revisions of concepts of and models for brain organization and function took place constantly. In many laboratories conditioning was again under investigation as a phenomenon in itself, and the conditioning of electrical activity of the brain was accomplished, as was that of several components of cardiac action. Work in biochemical and microbial genetics, going forward at a tremendous pace, was expected to bring forth important findings for clinical psychiatry and the understanding of personality. Among data established were the further identification of the chromosomal abnormalities associated with mongolism and the high incidence of chromosomal aberrations in aborted fetuses. (See also BIOCHEMISTRY; GENETICS.)

Mental subnormality was beginning to receive the attention and resources this important problem deserved. Many states were planning additional facilities for the study and care of such individuals, and the close connection between retardation and unemployability was finally acknowledged by professional persons, as well as by government authorities. The President's Panel on Retardation, active throughout 1962, was directed to submit findings by the end of the year regarding current programs, personnel requirements, research prospects, and private and governmental resources in the fight against mental retardation.

Training in psychiatry and for mental health personnel also received increased attention through 1962. For the education of nonphysician personnel, the publication of the Group for the Advancement of Psychiatry, No. 51, *Toward Therapeutic Care* was a most important up-to-date revision of an earlier publication on nursing. Residency programs for psychiatric specialists were under review by several committess. The Federal Grant Program for training was liberalized in the direction of awarding relatively unrestricted funds to recognized departments and lifet.me appointments to individuals of demonstrated competence in teaching or research and to younger men of exceptional promise.

Bibliography, 1962.—Bettelheim, Bruno, *Dialogues with Mothers* (Glencoe, Ill.); Stein, Morris I., ed., *Contemporary Psychotherapies* (Glencoe, Ill., 1961); Srole, Leo, and others, *Mental Health in the Metropolis* (New York); "Psychopharmacology and Community Mental Health Services," *American Journal of Public Health*, supplement, September 1962; Brazier, Mary, ed., *Brain and Behavior* (Madison, N.J., 1961); Sheer, Daniel, ed., *Electrical Stimulation of the Brain* (Austin, Texas, 1961); *Journal of Psychiatric Research*, quarterly.

(See also PSYCHOLOGY.)

STEPHEN FLECK,
Psychiatrist-in-Chief, Yale Psychiatric Institute.

PSYCHOLOGY

The 17th annual convention of the American Psychological Association (APA) met in St. Louis, Mo., Aug. 30–Sept. 5, 1962. The association, founded in 1892, is the major organization of psychologists in the United States, having a membership of more than 20,000. (See SOCIETIES AND ORGANIZATIONS.)

The convention's complete program, containing abstracts of all contributed papers and titles of formal symposia, may be found in the June 1962 issue of *American Psychologist*. The new president elect is Quinn McNemar of Leland Stanford University, and the current president is Charles E. Osgood of the University of Illinois.

On APA Day (Sunday of the convention week) addresses were presented in the morning by the recipients of the 1961 Distinguished Scientific Contributions Awards. These were James J. Gibson of Cornell University, whose paper was entitled "The Useful Dimension of Sensitivity"; Donald O. Hebb of McGill University, whose paper was called "The Semiautonomous Processes"; and Henry A. Murray of Harvard University, who read a paper on "Studies of Stressful Dyadic Discussions." The annual report of the officers of the APA on budget, council decisions, and changes highlighted advances and growth, as well as problems which confront the organization. The retiring president, Paul E. Meehl of the University of Minnesota presented his presidential address in a paper entitled "Schizotaxia, Schizotypy, Schizophrenia."

Research and Theory.—The 1962 *Annual Review of Psychology* (Vol. 13) covers 17 fields, including developmental psychology, perception, educational psychology, psychotherapy, personality, and learning theory. Among the less familiar topics are ethology, neurophysiology of learning, and consumer analysis.

Ethology, as reviewed by Martin Lindauer, concerns work on the social life, aggregation, and communication within species of animals from insects to vertebrates. Research is pointed out on such matters as conditions under which congregates form among different species, patterns of care for the young, patterns of division of labor, and patterns of interaction among individuals through communicatory devices.

Neurophysiological theories explaining learning phenomena are certainly not new, as may be evidenced by the concept of differential synaptic resistances to neural impulse flow to account for habit formation, a concept that was popular for a long time. However, a review by Garth J. Thomas considers many exciting newer techniques for the experimental manipulation of the brain and observing correlated learning phenomena. These include ablation studies, electrical stimulation, and pharmacological techniques. Among effects being actively studied are interhemispheric transfer of neural mechanisms of learning and its disturbance by sectioning forebrain commissures, the relation of subcortical lesions to conditioning, and interoceptive condition, to name just a few. There is also considerable interest in a search for the neural changes that occur in learning under such concepts as engram and trace.

Consumer analysis refers to the study of consumer buying in relation to saving as affected by happenings in the greater community and as an index of such factors as national optimism-pessimism. In his review of the topic, Lester Guest concerned himself especially with many methodological problems, such as sampling, observer training and observer bias, and instrument construction.

Related to consumer analysis, social psychology, and a number of other fields is the scientific study of mass communication. Here Wilbur Schramm made reference in his review to the wide spread in competence and interest characterizing research in this area during the preceding 10 years; 60 universities and research institutions were represented in the bibliography on which his review was based. Progress has been made in systematizing theory around the process of persuasion and attitude change; much information has been gathered regarding the use of mass media as teaching media; and knowledge is accumulating in regard to entertainment content of the mass media with reference to audience behavior and its effects on children.

PUBLIC HEALTH

A high level of health continued in the United States in 1962. The country was free of major epidemics. The incidence of paralytic poliomyelitis was the lowest since nationwide statistics on the disease were first gathered in 1912, with only 685 cases reported as of December 15. On the basis of cyclical occurrences of influenza in the past, health authorities anticipated that local outbreaks of Type A_2 (Asian) influenza were likely during the winter of 1962–63, and urged vaccination of those groups in the population which have proved most vulnerable to the disease, including persons with chronic illnesses, pregnant women, and persons over 45 years of age.

Immunology.—In the field of immunology, Types I and II of the oral live-virus poliomyelitis vaccine, developed by Dr. Albert B. Sabin, were licensed in 1961 by the secretary of health, education, and welfare. Type III was licensed in March 1962.

After the licensing of these vaccines, a number of communities organized mass vaccination programs. By mid-September, about 42 million doses of the oral vaccine had been administered. On September 15, however, the surgeon general's special advisory committee on oral poliomyelitis vaccine recommended that Type III vaccine be limited to preschool and school-age children and to adults in high-risk areas, and that mass programs using Types I and II vaccine be continued for all ages. These recommendations followed a review of the evidence of the occurrence of cases of poliomyelitis after the use of oral vaccine.

The killed-virus vaccine developed by Dr. Jonas Salk also continued to be used during the year. Since licensing of this vaccine in April 1955, about 537 million doses have been distributed, and it is estimated that more than 50 million people have received 4 or more doses.

Full-scale field testing of an experimental vaccine for measles continued throughout the year. Early in 1962, the U.S. Public Health Service announced an all-out effort to develop vaccines against upper respiratory infections, popularly grouped under the general term of "common cold"; the first contract under this new vaccine development program was signed on April 29. (See also RESPIRATORY DISEASES.)

Research.—The Public Health Service intensified its research into the relationship of viruses and cancer. Noteworthy progress was made in methods of caring for patients with acute leukemia, including transfusions of pooled platelets from numerous donors to prevent and control hemorrhage, a complication that often takes the lives of acute leukemia patients before drug treatment has had time to take effect. (See also CANCER.)

Among advances in diagnosis of heart attacks was the modification and improvement of precor-

dial scanning as a simple and sensitive technique for detecting left-to-right shunts, one of the most frequent signs of congenital heart disease. (See also HEART DISEASE.)

One of the most significant and dramatic scientific accomplishments of the year—representing a major breakthrough in the chemistry of heredity—was the partial deciphering of the so-called genetic code. This code involves the two heredity chemicals, deoxyribonucleic acid (DNA) and ribonucleic acid (RNA), and provides the means by which living cells store and transmit genetic information. (See also BIOCHEMISTRY; GENETICS.)

Support of research into the causes and prevention of accidents—the fourth leading cause of death in the United States—was increased about 50% over the previous year. A dramatic increase in the installation and use of auto seat belts resulted largely from the cooperative campaign of the Public Health Service, the National Safety Council, and the American Medical Association.

On June 7, 1962, the Public Health Service announced plans to appoint an expert committee to study the impact of smoking on health. The study, which began in the fall of the year, consists of two phases: (1) the nature and magnitude of the health hazard; and (2) recommendations for action.

Radiation Monitoring.—In response to the resumption of nuclear weapons testing in the atmosphere by the USSR in September 1961 and the United States in April 1962, the existing federal-state-local network for monitoring levels of ionizing radiation in milk, water, air, and certain foods was strengthened in 1962. Fallout from these tests resulted in higher levels of radioactivity in many areas than had previously been experienced; in the opinion of most public health authorities, however, the level of radiation exposure of the general population was not high enough to warrant undue public concern. Meanwhile, a greatly accelerated research program is being carried on to determine with greater precision the potentially harmful effects of relatively low levels of exposure to radiation over protracted periods of time. (See also ATOMIC ENERGY.)

Health Legislation.—Several new legislative developments affected the Public Health Service in 1962. Legislation signed on August 14 established two new institutes at the National Institutes of Health: the Institute of Child Health and Human Development, and the Institute of General Medical Science. The latter will support basic studies of biological and related processes. Amendment of the Air Pollution Control Act of 1955 extended for an additional two years technical assistance and research related to air pollution control, including motor vehicle exhaust studies. Public Law 87–692 authorized the Public Health Service to make grants for the establishment and operation of family health service clinics for domestic agricultural migratory workers and their families. The Vaccination Assistance Act of 1962 provides for grants to states and communities to buy vaccine and conduct immunization programs to eradicate polio, diphtheria, whooping cough, and tetanus.

Vital Statistics.—A total of 4,268,326 live births were registered in the United States in 1961, virtually the same as in 1960. Although the total number of births has remained fairly constant in recent years, the crude birth rate—live births per 1,000 people—has declined somewhat. The rate for 1961 was 23.3, as compared with 23.6 in 1960 and 24.5 in 1951. All of these rates, however, are well above those that prevailed between 1920 and 1945.

The average length of life for the entire population was 70.2 years in 1961, an all-time high and substantially above the life expectancy of 68.4 years in 1951.

The infant death rate dropped from 28.4 per 1,000 live births in 1951 to 25.3 per 1,000 in 1961. The maternal mortality rate has declined by more than 50% in the same period, from 7.5 per 10,000 to 3.2 per 10,000.

The principal communicable diseases of childhood—scarlet fever, diphtheria, whooping cough, and measles—accounted collectively for 243 deaths per 100,000 children aged 15 and under in 1900. By 1950 this rate had declined to 5 per 100,000, and in 1961 to 1 death per 100,000. Death rates in the total population for tuberculosis and syphilis declined from 20.1 per 100,000 to 5.7, and from 4.1 to 1.8, respectively, in the 1951–61 period.

The chronic diseases which characterize the latter part of life remain by far the leading causes of death, and their death rates have tended to rise slightly in the past decade. The death rate for the major cardiovascular-renal diseases was 513 per 100,000 in 1951, and 514 in 1961. For cancer the corresponding rates were 140.5 and 147.5. (See also DEATH, CAUSES OF.)

LUTHER L. TERRY,
Surgeon General, U.S. Public Health Service.

PUBLIC OPINION SURVEYS

In their coverage of 1962 election campaigns in the United States, the major published polls continued their trend toward more detailed analyses of voting intentions and away from flat predictions of the outcome. The last of seven Gallup Poll reports of national congressional preferences showed a Democratic majority of 55.5%. The poll thus foreshadowed the strong Democratic showing in elections to the House of Representatives, but took care to warn that "national percentages for the two parties cannot be translated directly into seats." The last of six California poll reports on the state gubernatorial election gave Gov. Pat Brown a 53-to-47 edge over Richard Nixon, a lead which the poll termed "significant, but not decisive." Throughout the campaign, the polls reported fully on such matters as probable turnout, shifts in voting intention among population subgroups, and things liked or disliked about the two parties or candidates. (See also ELECTIONS, U.S.)

Private surveys were increasingly relied upon by the candidates themselves. In New York the nomination of Robert M. Morgenthau, Jr., as Democratic gubernatorial candidate was widely attributed to a private survey which reportedly found him to be the party's strongest candidate. It has been suggested that the use of surveys for political purposes has coincided with the deterioration of party machines, and that the polls now provide the same sort of information formerly obtained by precinct workers. They are only incidentally relied upon to forecast election outcomes, but more often to assess the strengths and weaknesses of the candidates and to guide the allocation of campaign resources.

Other Trends.—As in past years, there was a continued expansion of the use of public opinion surveys and a gradual improvement in techniques. The design, execution, and analysis of surveys have become ever more complex and sophisticated. In 1962 few surveys were content with asking for simple preferences and reasons therefor. Routinely, questions were asked concerning the issue's importance to the individual, his past behavior, his expectations for the future, and the amount of his information. There was an observable trend toward "contextual analysis," in which opinions are studied in the context of the individual's environment. Availability of high-speed electronic computers facilitated many types of analysis which were formerly impossible.

The Gallup Poll remained the only regularly published source of national survey data. Among its findings during the year were continued support for the United Nations (78% thought it was doing a good or fair job) and a decline in approval of "the way Kennedy is handling his job as president" (from 79% in March to 73% after the steel crisis in April, 71% after the stock market slump in May, and 62% after the Mississippi riots in October). In a survey conducted the evening of October 22, Gallup reported that 84% of those who heard or watched the president's speech approved of his decision to act in the Cuban crisis, even though one in five feared it would mean all-out war.

Activities Abroad.—Survey research corporations and institutes continued to proliferate abroad. A Coordination Center for Southeast Asian Studies was established in Bangkok to serve as clearing house for market and opinion research in Burma, Cambodia, the Philippines, Thailand, Vietnam, Singapore, Malaya, and Indonesia. A Russian statistical journal reported on three polls conducted by an "institute of public opinion" established by *Komsomolskaya Pravda,* the newspaper for young Communists. A thousand men and women were polled "at ten points located on the Thirtieth Meridian" on the issue: "Will mankind succeed in averting war?"; questionnaires concerning economic conditions and living standards were distributed in "65 trains leaving Moscow in various directions"; and 20,000 mail questionnaires were received from youthful readers on the attitudes and goals of their generation. The Gallup Poll's West German affiliate reported a continued decline in the proportion of West Germans who would vote today for "a man like Hitler." Formerly between 12% and 15%, the figure began to drop in 1958, and in 1962 was only 3%.

Events.—The Roper Public Opinion Research Center, established in 1957 as a repository for survey data the world over, dedicated its new building in Williamstown, Mass., in September. The Center had in its files nearly 2,000 surveys from 29 countries. The 17th annual conference of the American Association for Public Opinion Research (AAPOR), held at Lake George, N.Y., in May, was dedicated to the memory of Samuel A. Stouffer (d. 1961). The AAPOR Award for distinguished achievement in public opinion research was received by Angus Campbell, director of the Survey Research Center, University of Michigan, and coauthor of *The American Voter* (1960).

PAUL B. SHEATSLEY,
Eastern Representative, National Opinion Research Center, University of Chicago.

PUBLIC UTILITIES

Sales of electric energy to ultimate consumers in the United States (excluding Alaska and Hawaii) for the 12 months ending June 30, 1962, reached 749.2 billion kw.-hr., an increase of 7.5% over the preceding 12-month period, according to Federal Power Commission figures. Electric utility generating plants in the United States increased their installed generating capacity over the same period from 174.4 million kw. to 186.0 million kw. Of the latter amount, 146.3 million kw., or 78.7%, was steam produced; 36.7 million kw., or 19.7%, was hydro; and 3.0 million kw., or 1.6%, was internal combustion. Of the same total, 75.7%, or 140.8 million kw., was investor-owned, and 45.2 million kw., or 24.3%, was owned publicly or by cooperatives. Average annual residential consumption of electricity in 1961 rose from 3,854 kw.-hr. to 4,019 kw.-hr., while the average cost per kw.-hr. dropped from 2.47 cents to 2.45 cents (revised figures).

As of October 1962, electric utilities were participating in the operation of seven nuclear power plants with a combined capability of approximately 668,500 kw. Included in this total was the Indian Point plant of the Consolidated Edison Company of New York, with a capacity of 275,000 kw. The plant went critical Aug. 2, 1962. Electricity from atomic energy was produced in Canada for the first time on June 4, 1962, at the Rolphton, Ontario, plant.

The utility industry continued the development of high-voltage transmission systems. A 345,000-volt transmission line supplying Niagara Falls power to New York City was completed on June 15, 1962. A 460,000-volt line is now in operation in western Pennsylvania, and a 500,000-volt line is planned to connect a mine-mouth plant to electric load centers in Virginia. Attention is being given to direct-current transmission systems which may offer substantial economies at high voltages and under certain special conditions. In an increasing number of instances, power-pooling agreements have come to include interlocking construction programs in which each utility adds capacity in turn and sells excess power to pool members. There have been continuing proposals of government-owned, power-grid systems. The Federal Power Commission is giving concentrated study to the economics of power transmission and the location of generating facilities.

The Priest River hydro plant on the Columbia River was dedicated on June 2, 1962. It was built by a Public Utility District and has a capacity of 788,400 kw. The Consolidation Coal Company and the Texas Eastern Transmission Company have announced plans for a $100 million, 350-mile coal-slurry pipeline from West Virginia to utility plants in eastern Pennsylvania, New York, and New Jersey. To meet the competitive threats, several railroads are planning integrated trains of permanently coupled cars to shuttle back and forth between mines and plants. The Babcock & Wilcox Company demonstrated the instantaneous burning of a solution of coal and water to produce electricity commercially. There has been a revival of interest in pumped-storage hydro plants, due in part to improvements in the reversible turbine. (See also ATOMIC ENERGY; ELECTRICAL INDUSTRIES.)

Natural Gas.—Public utility sales of natural gas increased to 93.6 billion therms in 1961, an increase of 3.4% over 1960. Marketed production of wet natural gas accounted for 33.2% of all energy production in the United States in 1961, a slight increase. Proved recoverable reserves increased to 267.7 trillion cubic feet at the end of 1961, an increase of 1.5%. The largest additions were again in Louisiana. Twelve new underground storage pools were added during the year, bringing the total number up to 229 with a capacity of 3,121 billion cubic feet. The industry increased its network of mains by 4.4% to 659,000 miles. Gas utility and pipeline construction expenditures for new facilities amounted to $1,662 million.

The Federal Power Commission made substantial headway in reducing the huge backlog of natural gas pipeline cases before it. In the twelve months ending June 30, 1962, annual amounts under suspension were reduced by nearly $100 million to $277 million, and refunds of $153 million were made to ratepayers. The area-wide pricing system for independent producers was sustained by the U.S. Court of Appeals in November 1961. The U.S. Supreme Court held on April 30, 1962, that the Federal Power Commission had no right to approve the merger of the Pacific Northwest Pipeline Corporation into the El Paso Natural Gas Company while an antitrust suit challenging the merger was pending before a federal court. The industry gave increasing attention to the use of the gas turbine as a localized source of energy for the generation of electric power. Several gas utilities made test installations. (See also FEDERAL POWER COMMISSION; GAS; PETROLEUM.)

Telephone and Telegraph.—Telephones in service in the United States and Puerto Rico increased by 4.2% to 77,575,100 at the end of 1961. Of these, the 23 Bell Telephone operating companies accounted for 65,508,000, and 3,035 independent companies accounted for 12,067,100. The number of these independent companies has been steadily declining in recent years because of mergers and consolidations. As a result of changes in the accounting for intrastate and interstate expenses, Bell companies made reductions of approximately $39 million a year in intrastate rates.

Telstar, the American Telephone and Telegraph Company's experimental satellite, was launched on July 10, and on the same day it transmitted signals from the United States to Europe. A communications satellite bill was signed by the president on August 31. The bill provides for the creation of a private corporation in which half of the stock will be owned by private investors and half by communications companies.

The Federal Communications Commission in May ordered an investigation of the domestic telegraph industry to

determine what steps should be taken to assure future service. Since 1945 the volume of annual messages has declined from 245 million to 131 million, although other services have been expanded. (See also FEDERAL COMMUNICATIONS COMMISSION; SPACE FLIGHT; TELEPHONE.)

Finance.—The utility industries offered a total of $4,418 million of securities to the investing public in 1961, compared with $3,691 million the year before. Offerings of the electric utility industry declined slightly; those of the gas and telephone industries increased.

PUERTO RICO

Situated in the Caribbean Sea about 1,000 miles southeast of Florida, the Commonwealth of Puerto Rico is the easternmost island of the Greater Antilles. It has a total area of 3,435 square miles, including the islands of Vieques (51 sq. mi.), Mona (19 sq. mi.), and Culebra (11.8 sq. mi.). Self-governing in domestic affairs, Puerto Rico has a voluntary association with the United States, which is responsible for its defense and foreign affairs. Puerto Ricans are also citizens of the United States. Spanish is the official language.

Population.—According to the 1960 census, Puerto Rico's population is 2,349,544, a decennial increase of 6.3%, despite the net emigration in 1950–59 of 430,522 persons, almost entirely to the United States mainland. The 1961–62 net emigration was 11,363, compared with 13,800 in 1960–61. The principal cities (with 1960 census populations) are San Juan, the capital, 432,377; Ponce, 114,286; Mayagüez, 50,147; and Caguas, 32,015. The ethnic composition of the population (1950 census) is 79.7% white and 20% Negro.

Government.—Ceded to the United States by Spain by the Treaty of Paris (Dec. 10, 1898), Puerto Rico became a free commonwealth by act of the U.S. Congress on July 25, 1952. Executive power is vested in a governor (Luis Muñoz Marín, elected Nov. 6, 1960 for a 4-year term), assisted by an appointed Council of Secretaries (Roberto Sánchez Vilella, secretary of state). The bicameral legislature, elected by universal suffrage for a 4-year term, consists of a 32-member Senate and a 64-member House of Representatives. Puerto Rico is represented in the U.S. House of Representatives by a resident commissioner (Antonio Fernós-Isern), who may take part in debate but may not vote. The Supreme Court is the highest judicial body, headed by Luis Negrón Fernández. Puerto Ricans do not vote in United States presidential elections, do not pay United States income tax, but are subject to military conscription. Principal political parties (with number of votes received in the 1960 elections): Popular Democratic Party, 457,887; Republican Statehood Party, 252,462; Christian Action Party, 51,292; and Independence Party, 24,122. (See also below *Events, 1962.*)

Finance.—Total revenue, 1961: $263 million; expenditure: $318 million. Chief items of expenditure: education, $98 million; health and public welfare, $72 million; and industrial, agricultural, and commercial development, $34 million. United States grants and payments in Puerto Rico in 1960–61 totaled $192.2 million. Total assets of the Puerto Rico Government Development Bank were $118.3 million at the end of 1961. Property valuation was $1,900 million in 1961–62.

Puerto Rico's Gov. Luis Muñoz Marín, shown with his wife, in 1962 advocated a plebiscite to let Puerto Rico decide its future political status in relation to the United States.

WIDE WORLD

Education and Religion.—Well over one third of the island's population is receiving some kind of formal education. (In the United States the figure is less than one fourth.) A special drive has increased adult literacy to 89% in 1962, as against 75% in 1950. The commonwealth spends nearly one third of its budget on education, but there is still a shortage of teachers and accommodations. In 1961–62 there were 589,458 pupils in the public day schools and 56,634 in accredited private schools, as compared with 408,128 and 22,595, respectively, in 1950. The University of Puerto Rico in Río Piedras has increased its attendance from 5,000 in 1940 to 21,262 in 1962. The Catholic University in Ponce and the Inter-American University in San Germán are other institutions of higher learning. Roman Catholicism is the predominant religion.

Transportation and Communications.—In 1962 Puerto Rico had 3,014 miles of paved roads, 44 standard broadcasting stations, 9 television stations, 1,410,000 radios, and 180,000 television sets. Motor vehicles registered in 1961 totaled 202,803; telephones totaled 89,892. San Juan International Airport is served by six airlines.

Economic Indicators.—Puerto Rico's gross national product rose to $1,985 million in 1961–62, an increase of 10.6% over 1960–61. Total net income rose from $614 million in 1950 to $1,650 million in 1961–62; per capita income reached $700 for the first time. The consumer price index (1957–59 = 100) reached 109.1 in April 1962 (107.7 in April 1961). In 1961–62 about 84,000 workers (13% of the labor force) were unemployed, compared with 75,000 persons (12%) the previous year. The average hourly wage was $1.063 in July 1962 (up four fifths of 1 cent from July 1961).

Manufactures and Minerals.—Mechanization of agriculture, manufacturing, and shipping has caused an increase in technological unemployment, but this has been offset by expansions in manufacturing and other industries. The net income from manufacturing was $381 million in 1961–62, compared with $333 million in 1960–61. In 1960, 71,728 persons were engaged in nondurable goods manufacture and 22,380 in the manufacture of durable goods. The principal industries are food processing; apparel and textiles; metal products; stone, clay, and glass products; and tobacco manufactures. The number of factories established with government aid (Operation Bootstrap) totaled 863 in 1961–62, an increase of 105 over the preceeding year. The trend of the commonwealth's promotion efforts has been increasingly toward the building of factories to process agricultural products and toward the development of interlocking industries in which the byproducts of one become the raw materials of another. Mineral production, consisting primarily of cement and stone, was valued at $33.8 million in 1961.

Agriculture.—Problems created by old patterns of land tenure and outmoded methods of farming, together with the urgent need to improve grading, packaging, and distribution techniques, have retarded the rate of development in agriculture. Sugar remains the island's principal crop; dairy farming comes next. Total agricultural production in 1961–62 reached $261 million. In 1960, 136,096 persons were engaged in agriculture. The 1961 sugarcane crop was estimated at 10,754,000 tons (9,997,000 in 1960), from which 1,110,000 tons of sugar and 63 million gallons of blackstrap molasses were produced. Other important crops include oranges, mangoes, coconuts, bananas, grapefruit, tobacco, and coffee.

Foreign Trade.—Exports in 1961 totaled $711.1 million ($604.3 million in 1960); imports totaled $1,018 million ($923.7 million in 1960). Trade is almost entirely with the United States mainland (84% of the imports and 98% of the exports in 1961–62). The 1961–62 tourist season broke all records, with over 394,000 visitors spending an estimated $66 million.

Events, 1962.—On July 25, Governor Muñoz Marín made public an exchange of letters between President Kennedy and himself on the desirability of a plebiscite through which the Puerto Rican people would express their wishes on one of three different permanent forms of political status: (1) continued commonwealth status, strengthened and altered somewhat; (2) statehood in the United States; and (3) independence. Both leaders expressed the opinion that the association of the United States and Puerto Rico needed perfecting, and that the people of Puerto Rico should be afforded complete freedom of choice. The Independence Party (no longer an established political party since gaining only 3% of the vote in the 1960 election) and the Republican Statehood Party threatened to boycott the plebiscite, which will probably be held in mid-1963.

Following the visit to Puerto Rico in August of Msgr. Emanuelle Clarizio, apostolic delegate to Puerto Rico and papal nuncio to the Dominican Republic, the long-standing rift between the Roman Catholic Church and Governor Muñoz Marín was healed. The Christian Action Party, established with the aid of Bishop James McManus of Ponce and Archbishop James Davis of San Juan, announced that it would participate in the forthcoming plebiscite.

Two camps for the physical training of U.S. Peace Corps volunteers were established in Puerto Rico in 1962. Area studies and other training programs for Peace Corps volunteers were inaugurated in collaboration with the University of Puerto Rico, the Catholic University, and the Inter-American University. Nearly 500 delegates from 43 countries attended the Peace Corps-sponsored International Conference on Middle Level Manpower on October 10–12. The conference resulted in wide acceptance of the Peace Corps idea, with eight countries declaring their readiness to establish such programs of their own.

QUEBEC

Canada's largest province, Quebec has an area of 594,860 square miles (15.5% of the total area of Canada), consisting of 523,860 square miles of land area and 71,000 square miles of water. The population, according to the 1961 census, is 5,259,211 (est. June 1, 1962, 5,366,000). The overwhelming majority of the population is of French origin (80%) and Roman Catholic (88%). In 1961, 3,906,404 persons lived in urban localities and 1,352,807 in rural areas. Principal cities, with their 1961 population, are: Montreal, 1,191,062 (metropolitan area, 2,109,509); Quebec, the capital, 171,979 (metropolitan area, 357,568); Verdun, 78,317; Sherbrooke, 66,554; Trois-Rivières, 53,477; and Hull, 56,929. Montreal (q.v.) is the chief metropolis of Canada and the second-largest French-speaking city in the world, ranking next to Paris.

Government.—Quebec's government comprises a lieutenant-governor named by the government of Canada; an Executive Council of 16 members, one of whom has no portfolio; a Legislative Council of 24 members appointed for life by the lieutenant-governor in council; and a Legislative Assembly of 95 members elected for five years. The lieutenant-governor in 1962 was Paul Comtois; Jean Lesage, leader of the Liberal Party, was premier. Membership in the Legislative Assembly in 1962 was as follows: Liberal, 53; Union Nationale, 41; and Independent, 1. The people of the province are represented in the Canadian Parliament by 24 members in the Senate and 75 in the House of Commons.

Finance.—For the 1961–62 fiscal year the total revenue of the province was $754,114,485; the ordinary expenditure, $713,587,762; and net capital expenditure, $103,294,698. The net funded debt was $496,565,794.

Education.—The schools governed by the Education Act are either Catholic or Protestant, and French and English are taught in both types. In 1961 the entire school system included 9,259 schools, 67,151 teachers, and 1,445,751 pupils. Teacher training is provided in 115 normal schools. Secondary education is provided by public schools and 104 *collèges classiques*, three of which have modernized their curricula. Higher education is provided by six universities.

Purchasing Power.—The purchasing power of Quebec's population was estimated at $7,004 million in 1961; salaries and wages totaling $4,986 million made up the greater part of the amount. Retail trade in 1961 amounted to $4,109 million.

UPI

Premier Jean Lesage of Quebec campaigns in preparation for the November 14 provincial election, in which his Liberal Party won a 31-seat majority in the Legislative Assembly.

Hydroelectric Energy.—The actual capacity of turbines installed in the province represents 47% of the total Canadian installation and about one third of the resources recorded at the present time. Hydroelectric turbines installed during 1961 represented an increase of 136,700 horsepower and brought the total turbine installation in Quebec to 12,576,845 hp., or 9,315,000 kilowatts, with active construction under way for other large-scale projects expected to add 240,000 hp. of new hydroelectric capacity in 1962. Subsequent to 1962, planning or preliminary construction work already in hand will make available more than 5.9 million hp. of new hydroelectric capacity.

Transportation and Communications.—In 1961 Quebec had 34,178 miles of improved roads, out of a total road mileage of 44,734, and 1,267,602 registered motor cars. There were 5,087 miles of railways and 1,520,622 telephones.

Agriculture.—Agricultural land covers an area of 66,615 square miles, or about 12% of the total area of the province. In 1961, 7,239,000 acres were under cultivation (including pastures); the aggregate value of agricultural production was estimated at $674,400,000. The three leading crops are hay and clover, oats, and potatoes. Cash income from the sale of farm products was valued at $444,992,000 and was derived from the sale of dairy products ($179,541,000); livestock ($134,666,000); poultry and eggs ($56,783,000); field crops ($9,557,000); fruits and vegetables ($24,393,000); forest products, maple products, tobacco, honey, and miscellaneous commodities, ($40,052,000).

Forestry.—Quebec's commercial forests cover an area of 264,160 square miles. The wood cut during 1961 was valued at $281,568,000 and included pulpwood valued at $181,656,000; lumber, $76,020,000; veneer, excelsior, matches, and similar products, $7,900,000; and charcoal and firewood, $10,556,000. In 1961 the pulp and paper industry provided employment to 26,253 persons and had a payroll of $137,932,000 and a gross production value of $597 million. Newsprint production was estimated at 3,136,000 tons ($359,680,000).

Mines and Quarries.—The value of mineral production in 1961 was estimated at $447,437,000, subdivided as follows: metals, $212,169,000; industrial minerals, $148,258,000; and building materials, $87,017,000. The Quebec Cartier Mining Company is developing the so-called Quebec Labrador Trough, which extends from Lac Jeannine to the far northern tip of the Ungava Peninsula. The company shipped its first iron ore concentrates from its mill at Gagnon via Port Cartier on the north shore of the St. Lawrence River in July 1962. It was expected that the full production peak of some 8 million tons of concentrates a year would be reached in 1963.

Manufactures.—Manufacturing establishments during 1961 paid $1.6 billion in salaries and wages to 434,000 workers. The gross value of factory

shipments was estimated at $7,206,096,000. Chief industries include pulp and paper production, nonferrous smelting and refining, slaughtering and meat packing, and the manufacture of petroleum products, cotton yarns and cloth, factory clothing, railway rolling stock, electrical appliances, and synthetic textiles.

Events, 1962.—Since July 6, 1962, the Province of Quebec has had its own General Investment Corporation, the duties of which will be to promote the creation and development of industrial and commercial undertakings, so as to insure the economic growth of Quebec and contribute to full employment.

The main political event of the year was the general election on November 14, two years prior to expiration of the Legislative Assembly's mandate. The Liberal Party, in power since June 22, 1960, had aimed at a *politique de grandeur* in the fields of education and social assistance, and Premier Lesage wanted popular approval of its project to nationalize all private companies producing and distributing electricity in the Province of Quebec—a project estimated to bring about capital expenditures of some $600 million. The opposition had promised a referendum on the nationalization of electricity. At the polls, the Liberal Party gained favor, taking 63 of the 95 seats in the Legislative Assembly. The Union Nationale was represented by 31 members, and one independent candidate won the remaining seat. (See also CANADA.)

The Royal Commission of Inquiry on Education held several public hearings in 1962 and studied a few hundred briefs. The parent commission's report will serve as a basis for a complete reorganization of education in Quebec.

RADIO AND TELEVISION

Highlights of the year 1962 in radio and television are reviewed in this article in three sections: (1) The Radio-TV-Electronics Industry; (2) Radio and Television Engineering; and (3) Radio and Television Programs. For additional information, see the Index entries *Radio* and *Television.*

THE RADIO-TV-ELECTRONICS INDUSTRY

The radio-TV-electronics industry in the United States added another $1 billion in sales in 1962 to reach a new peak of $13 billion. Government procurement accounted for about 60% of this total, but gains in industrial electronics and home entertainment products were also impressive. Congress, for the first time, took actions designed to expand television broadcasting, both commercial and educational, while FM radio was revitalized through the adoption of stereophonic broadcasting.

Expansion of TV Expected.—The Federal Communications Commission (FCC) sponsored legislation requiring manufacturers to cease producing very-high-frequency (VHF)-only receivers and to manufacture sets receiving both VHF and ultra-high-frequency (UHF) channels. After the law was enacted, the FCC late in 1962 issued regulations requiring complete conversion to all-channel receiver manufacturing by April 30, 1964. A broad expansion of television broadcasting was expected. Although the 12 VHF channels have not been adequate to provide satisfactory TV service for all areas of the nation, the available UHF frequencies had been in little demand.

Congress also passed legislation under which the government will match, up to $1 million in each state and $32 million in total, costs of constructing educational TV broadcasting stations. (See also EDUCATION.)

Space Exploration.—Expanding activities of the United States government in space exploration began to have an impact on electronics production in 1962. More than 60% of all equipment used in space probes is electronic. The total budget of the National Aeronautics and Space Administration, in its race to beat the Soviet Union to the moon, was increased from $950 million in the fiscal year 1961 to $3.8 billion in 1963, and anticipated expenditures between 1962 and 1972 are estimated at between $50 and $60 billion.

Military purchases of electronic parts and equipment reached $7.6 billion in 1962—an increase of 12% over 1961. The emphasis was on research and development, rather than on production of hardware. (See also SPACE FLIGHT.)

Industrial Market.—The industrial market for electronics has grown fourfold during the past decade. In 1962 it represented 20% of total industry sales and paralleled consumer goods (radio-TV-phonographs), which before 1950 represented the lion's share of the business. The greatest gains have been in computing and data-processing equipment and industrial controls. Other industrial products include electronic testing and measuring devices, communication and navigational equipment, and nuclear, medical, and meteorological apparatus.

Consumer Goods.—TV-set sales increased in 1962 by more than 200,000 over 1961, to a total of 6.4 million. The long-delayed interest in color television, an increase in all-channel receivers, and a trend toward larger screens stimulated the market. Despite severe foreign competition in transistor portables, radio-set sales gained more than a million units in 1962 to a total of 11.8 million receivers, exclusive of 7.3 million automobile sets. Phonographs made a 25% gain to reach 5.0 million instruments, chiefly stereo. FM stereo, standardized by the FCC in 1961, unquestionably boosted the demand for radios. The FCC estimated that 250 FM stations—about one quarter of the total—had converted to stereo broadcasting by the end of 1962.

International Trade.—Both exports and imports of electronic equipment and components increased in 1962, and the enactment of the Trade Expansion Act in September was expected to have far-reaching effects on the industry. Exports rose 20% over 1961 to a total of $730 million, while imports increased from $179 million in 1961 to $240 million in 1962. Japan remained the most serious foreign contender for the American consumer dollar as increasing shipments of Japanese TV sets approached those of transistor radios.

Electronics Industry.—The fifth largest manufacturing industry in the United States, the electronics industry comprises more than 5,000 plants and more than 2,000 product categories. The heaviest concentrations of plants are in the Atlantic seaboard, the Chicago-Midwest, and the west coast (chiefly California) areas. Of the more than 850,000 employees, more than 130,000 are engineers or scientists. (See also ELECTRONICS.)

JAMES D. SECREST,
Executive Vice President,
Electronic Industries Association.

RADIO AND TELEVISION ENGINEERING

A new era in television began in 1962 with live television transmissions between the United States and Europe. The first transmissions took place on July 10, relayed by means of the American Telephone and Telegraph Company's experimental Telstar satellite, between Andover, Me., and stations in England and France.

The Telstar transmissions cannot be picked up directly by the general public. Plans are under study, however, for direct broadcasting to the home from earth satellites in synchronous equatorial orbits some 22,000 miles above the earth's surface, in which the satellites remain fixed with respect to the earth. Although such broadcasting stations may someday prove to be feasible, it is not expected that the problems of rocket launching, guidance, and high-capacity electric power supplies for such satellites will be solved for several years. In the meantime, transmissions via satellite will be confined to point-to-point relay. (See also SPACE FLIGHT.)

Television Stations.—The construction of new television stations throughout the world continued during 1962. The accompanying table lists the countries reported to have regular television serv-

SUMMARY OF WORLD TELEVISION, 1962

Country	Transmitting stations	Receiving sets
Albania[1]	1	...[2]
Algeria	6	67,500
Argentina	9	850,000
Australia	27	1,337,655
Austria	27[3]	350,000
Belgium	12	950,000
Bermuda	1	9,400
Brazil	37	1,430,000
Bulgaria	2	17,367
Canada	154	4,375,000
Chile	3	3,000
China (Communist)	26	100,000
Colombia	14	200,000
Costa Rica	4[4]	15,000
Cuba	27[5]	400,000
Cyprus	1	4,500
Czechoslovakia	100[6]	1,300,000
Denmark	11	795,000
Dominican Republic	4	18,000
Ecuador	2	5,000
El Salvador	3	30,000
Finland	19	315,000
France	152[7]	3,059,574
Germany, East	117[8]	1,500,000
Germany, West	419[9]	7,000,000

Venezuela	14	263,000
Yugoslavia	39[18]	100,000

[1] Inaugurated regular television service in 1962. [2] Sets-in-use estimate unavailable. [3] Includes 15 low-power satellite transmitters. [4] Includes 2 low-power satellite transmitters. [5] Recent information not available. [6] Includes 89 low-power satellite transmitters. [7] Includes 115 low-power satellite transmitters. [8] Includes 107 low-power satellite transmitters. [9] Includes 334 low-power satellite transmitters. [10] Closed-circuit cable system. [11] Includes 543 low-power satellite transmitters. [12] Includes 82 low-power satellite transmitters. [13] Includes 15 low-power satellite transmitters. [14] Does not include sets in Canal Zone. [15] Includes 28 low-power satellite transmitters. [16] Includes 6 relay units. [17] USSR claims 231 stations, but provides no data to substantiate claim. [18] Includes 32 low-power satellite transmitters. (Source: *Television Factbook.*)

ice during 1962, and gives the latest available statistics on the number of transmitters and home receivers in regular use. In the United States, the number of stations on the air increased from 620 at the end of 1961 to 644 at the end of 1962.

Ultra-High-Frequency (UHF) Stations.—The relatively small increase in the number of television stations in the United States reflects a continued slackening in the pace of new station construction. One of the reasons for this has been the approaching saturation of the 12 very-high-frequency (VHF) channels. These have been in great demand, while large numbers of channel assignments on the 70 ultra-high-frequency (UHF) channels have gone unused. This lack of interest in UHF television broadcasting has stemmed from many causes, especially the fact that less than 10 per cent of the receivers in use today are capable of receiving UHF transmissions. Few commercial UHF stations (84 as of June 30, 1962) are on the air, providing little inducement for the purchase of all-channel receivers; at the same time, the available number of UHF receivers has been too small to stimulate new UHF station construction.

This vicious circle was finally broken by an act of Congress in 1962, empowering the Federal Communications Commission (FCC) to require that all receivers shipped in interstate commerce be capable of receiving all television channels. Following conferences with the manufacturing industry, a date of April 30, 1964, was established after which only all-channel receivers may be distributed within the United States.

The FCC completed extensive engineering tests of UHF in New York City in 1962. A special transmitter and antenna were installed on top of the Empire State Building, and programs were broadcast simultaneously over the UHF station (Channel 31) and the regular commercial VHF stations in the city. Extensive tests and observations were made at thousands of homes in the New York City area for the purpose of evaluating the quality of UHF pictures. These tests showed the UHF to be capable of rendering a fully acceptable service within the New York metropolitan area, although somewhat inferior to the service provided by the VHF stations. At the completion of tests on Oct. 31, 1962, the City of New York took over the technical facilities installed by the FCC and continued the operation as the country's first municipal television broadcast system.

FM and AM Stations.—In radio broadcasting, an increasing number of frequency modulation (FM) stations began regular transmissions in stereophonic sound, employing a system standardized for the purpose in 1961. The number of commercial FM stations in operation during 1962 increased from 961 to 1,078, representing an all-time high in the number of FM stations in regular operation.

The expansion of standard (AM) broadcast stations was curtailed sharply in mid-1962 by an FCC order imposing a freeze on the authorization of new AM broadcast stations, in order to evaluate both technical and economic factors involved in the increasing growth of AM stations, which have increased almost fourfold since the end of World War II. Stations authorized prior to the freeze began operation, however, and the total number of stations on the air increased from 3,684 to 3,803 during the year.

Consulting Radio Engineer.

RADIO AND TELEVISION PROGRAMS

One of the most controversial television events of 1962 was a two-minute segment of a half-hour commentary program with a relatively low rating. The incident was the inclusion of an interview with Alger Hiss in an American Broadcasting Company program entitled *The Political Obituary of Richard M. Nixon,* conducted by Howard K. Smith on November 11. It was presented five days after former Vice President Nixon had lost his race for the California governorship.

Rarely has TV touched off such controversy as it did in putting on a man who was convicted for perjury after denying he had been a participant in a Communist spy ring. Hiss was investigated by the House Committee on Un-American Activities in 1948, when Nixon was a member of the committee. Many viewers denounced the network, Smith, and James C. Hagerty, vice president of news for ABC. But others, asserting that freedom of the press must be upheld, said the network had every right to use Hiss on the program. Two stations had refused to use the program, and two ABC advertisers who sponsored programs other than the one on which Hiss appeared requested (unsuccessfully) to cancel contracts totaling $1,500,000. A week after the Hiss incident, Hagerty appeared at the beginning of Smith's program, defending the network's decision to broadcast the program.

A notable event of the 1962 season was *A Tour of the White House* with Mrs. John F. Kennedy on February 14. She explained the changes and

(*Left*) Judy Garland and her guests Dean Martin (left) and Frank Sinatra. (*Center*) Richard Tucker (left), Eileen Farrell, and Leonard Bernstein at the opening night of Lincoln Center. (*Right*) Lucille Ball is guest star on Bop Hope's show.

restorations she had made in the White House interior. Accompanied on the tour by Charles Collingwood of CBS, Mrs. Kennedy filled a role amounting to that of a historian savoring the small facts and human stories in the evolution of the White House decor. The American Research Bureau estimated that 46,500,000 persons had watched the first telecast of the program, which was presented simultaneously by CBS and NBC. It was later televised by ABC and repeated by CBS.

Other Programming.—The most emotionally gripping news event on television and radio was on Feb. 20, 1962—the space flight of Lt. Col. John H. Glenn, the first United States astronaut to orbit the earth. Television coverage of the three-orbit flight lasted for nearly 12 hours. Television and radio also covered the orbital flights of Comdr. M. Scott Carpenter (May 24) and Walter Schirra (October 3)—the latter competing for viewers' attention with the final game of the National League pennant playoff.

On election night (November 6) the networks proved they had made great strides toward perfecting high-speed methods for gathering and reporting election results. With electronic computers that projected returns from carefully selected key areas, the networks accurately predicted winners in some areas only a short time after the polls had closed.

The first exchange of live television programs between the United States and Europe occurred on July 10 by means of Telstar, the communications satellite. Because of the brief periods when Telstar came into line of sight over the Atlantic, no regular program schedule could be established. Relay, a second communications satellite, was launched and used experimentally by television for transatlantic programs. (See also SPACE FLIGHT and the foregoing section, *Radio and Television Engineering.*)

The new television season in the fall of 1962 brought in 32 new network shows in prime evening time and saw the return of 66 programs. By category, comedy was the most heavily represented. Among the comedy stars who came back after an absence of one or more seasons were Lucille Ball, Jackie Gleason, and Sid Caesar. Steve Allen also returned in a 90-minute program syndicated to stations five nights a week.

The returning comedy star who scored the biggest hit was Lucille Ball. On *The Lucy Show* she portrayed a widow with children, but it was basically the same character she had created in *I Love Lucy,* on which she had starred for years with Desi Arnaz. Vivian Vance, who had been featured on *I Love Lucy,* played a divorcee on *The Lucy Show.*

The Lucy Show began the season as first in ratings compiled by the A. C. Nielsen Company. But in a later survey, first place was taken over by *The Beverly Hillbillies,* an unlikely situation comedy about an Ozark family that struck oil and went to live in Beverly Hills, Calif.

In addition to the returning *Ben Casey* and *Dr. Kildare,* the new television season had two new medical shows—*The Nurses* and *The Eleventh Hour.* There also were dramas about World War II, such as *Combat* and *The Gallant Men.* Military uniforms and atmosphere provided the background for such comedy shows as *McHale's Navy, McKeever and the Colonel,* and *Don't Call Me Charlie!*

Bob Newhart's weekly comedy program, his first series, was not renewed for 1962–63. Shortly before the sponsor decided not to renew the program, Newhart received a George Foster Peabody Award as the outstanding TV comedian of the year.

Among the outstanding special one-hour shows were *The Danny Kaye Show; The Judy Garland Show,* which was repeated; an original drama by Tad Mosel entitled *That's Where the Town's Going;* and *Julie and Carol at Carnegie Hall,* starring Julie Andrews and Carol Burnett. Poetry is not a television staple, but *Americans: A Portrait in Verses* got special attention by CBS viewers. The one-hour program presented excerpts from the works of 23 poets, read by 16 performers. More than 35,000 persons wrote for bibliographies.

Controversy was stirred by an episode of the CBS drama *The Defenders,* entitled "The Benefactor," which advocated the legalizing of abortion under certain circumstances. The network screened it in advance for its affiliates, and 25 stations declined to carry it. The drama also was rejected by the Canadian Broadcasting Corporation.

Three television children's programs, the type of show long advocated by Newton N. Minow, chairman of the Federal Communications Commission, made their debut in 1962—*Discovery '62*

(ABC), *Reading Room* (CBS), and *Exploring* (NBC).

Jack Paar left as host of NBC's *Tonight* show (also called the *Jack Paar Show*) on May 29 after almost five years. His final appearance combined tributes to the star with comedy, controversy, sentiment, and music. In the fall, Paar initiated a one-hour weekly program on NBC, which in format was not greatly unlike the *Tonight* show. He was succeeded on *Tonight* by Johnny Carson.

A New York television station (WCBS-TV) turned over 2½ hours of prime evening time for a complete performance of *The Merchant of Venice*. The show was taped in the New York Shakespeare Festival's amphitheater in Central Park.

Other Developments.—In 1962, New York received its first educational television station, WNDT, and what was reported to be the first municipally owned TV station, WNYC-TV. The latter station, operating on ultra-high-frequency (UHF) channel 31, was given to the City of New York by the FCC, which had built it to conduct a UHF experiment for a year.

A Senate subcommittee investigating juvenile delinquency charged that TV networks violated their own code of moral practice by increasing emphasis on crime, violence, and sex in their programs. The networks denied the charge. One program under strong attack by the subcommittee was ABC's *Bus Stop*, which had presented a drama about adultery, murder, and suicide involving a teen-age psychopathic killer.

Newton Minow of the FCC, who a year earlier had called TV a "vast wasteland," turned to radio when he addressed the National Association of Broadcasters a second time. He said that some of radio was "astonishingly good," but that too much was "incredibly bad." In too many communities, he declared, radio had too many commercials. But he credited both television and radio with improvements.

Minow received a Peabody Award for his efforts "to rescue the (television) wasteland from the cowboys and private eyes." He was the first government official to be cited by the Peabody committee, whose 13-man board includes critics, educators, and lawyers.

OUTSTANDING TV PROGRAMS IN 1962

Americans: Portrait in Verses—Character studies by American poets; read by Alexander Scourby, Peggy Wood, Kim Hunter, and others. Narrator: James Whitmore; producer: Richard Siemanowski. CBS, August 16.

Arms and the State (*NBC White Paper*)—Documentary study of the impact of the defense effort on American life. Narrated by Chet Huntley. NBC, March 25.

Arsenic and Old Lace—Robert Hartung's adaptation of Joseph Kesselring's comedy; with Dorothy Stickney, Mildred Natwick, Tony Randall, Boris Karloff, and Tom Bosley. NBC, February 5.

Birth Control and the Law (*C.B.S. Reports*)—Documentary and discussion of moral and legal aspects of birth control; narrated by Eric Sevareid; produced by Stephen Fleischman. CBS, May 10.

Broadway of Lerner and Loewe, The—A tribute to the composing team with excerpts from their musicals performed by Julie Andrews, Richard Burton, Maurice Chevalier, Robert Goulet, and Stanley Holloway. NBC, February 11.

Cancer Virus (*Breakthrough*)—Documentary survey of the search for the cause of cancer. Narrated by John Chancellor. NBC, June 8.

Chosen Child, The—Documentary study of child adoption; written by the program's producer, Robert Northshield, and director, Frank De Felitta. Narrated by John Chancellor. NBC, November 25.

Cyrano de Bergerac (*Hallmark Hall of Fame*)—Edmond Rostand's classic drama; with Christopher Plummer, Hope Lange, Donald Harron, and George Rose. NBC, December 6.

Danny Kaye Show, The—Comedy and music starring Danny Kaye, with Lucille Ball; directed by Greg Garrison. NBC, November 11.

Dialogues of Archibald MacLeish and Mark Van Doren, The—Informal conversation on a variety of subjects, filmed at MacLeish's farm in Conway, Mass. CBS, August 2.

Fat American, The (*C.B.S. Reports*)—Documentary study of the food industry and the problem of overweight. Narrated by Harry Reasoner. CBS, January 18.

Germany: Fathers and Sons—Documentary study of the "barrier of silence" separating the Germans who lived under Hitler from younger Germans searching for a tradition. Narrated by John Rich. NBC, June 15.

He Is Risen (*Project 20*)—Depiction of Christ's last days on earth, the Crucifixion, and the Resurrection, through art masterpieces; narration by Alexander Scourby; musical score by Robert Russell Bennett; produced by Donald B. Hyatt. NBC, April 15.

Heart and Artery Surgery (*Breakthrough*)—Four heart and artery operations, showing recent medical advances; narrated by John Chancellor and Dr. Henry Swan. NBC, April 23.

Inferno, The (*NBC White Paper*)—Documentary study of life in a slum in Palermo, Sicily. Written, directed, and filmed by Robert Young and Michael Roemer; narrated by Chet Huntley. NBC, May 18.

John Brown's Body—Stephen Vincent Benet's classic poem about the Civil War; with Douglas Campbell, Nancy Wickwire, and Lester Rawlins; narrated by Richard Boone; produced by Richard Siemanowski; directed by Joseph Chomyn; score by George Kleinsinger. CBS, January 14.

Julie and Carol at Carnegie Hall—Musical variety program featuring Julie Andrews and Carol Burnett; script by Mike Nichols and Ken Welch; choreography by Ernest Flatt; produced and directed by Joe Hamilton. CBS, June 11.

Laudes Evangelii—Miracle play with dance and music, depicting the life of Christ; choreography by Leonide Massine; music by Valentino Bucchi; libretto by Giorgio Signorini; originally shown in Great Britain in 1961. CBS, April 8.

Love of Three Kings, The—Montemezzi's opera performed by the NBC Opera Company; Alfred Wallenstein, conductor; Kirk Browning, director; with Giorgio Tozzi, Richard Torigi, Phyllis Curtin, Frank Poretta, and Nicholas di Virgilio. NBC, February 25.

Mental Illness (*Breakthrough*)—Documentary survey of the study and treatment of mental illness; narrated by John Chancellor and Dr. John Romano. NBC, June 22.

Merchant of Venice, The—Taped presentation of the Shakespeare play, produced by the New York Shakespeare Festival in Central Park; with George C. Scott, Nan Martin; staged by Joseph Papp. CBS, June 21.

Noah and the Flood—Dance allegory woven around a new musical score by Igor Stravinsky; choreography by George Balanchine; book by Robert Craft. CBS, June 14.

Opening Night at Lincoln Center—Live broadcast of the opening of Philharmonic Hall in New York City's Lincoln Center for the Performing Arts; narrated by Alistair Cooke; concert by the New York Philharmonic Orchestra, directed by Leonard Bernstein; Eileen Farrell, Jennie Tourel, George London, Richard Tucker, and others, soloists. CBS, September 23.

Other Face of Dixie, The (*C.B.S. Reports*)—Documentary study of school integration progress in four Southern cities; narrated by Harry Reasoner. CBS, October 24.

Picasso: An American Tribute—Study of Picasso's life and works; narrated by Brian O'Doherty. NBC, April 23.

Polaris Submarine: Journal of an Undersea Voyage—Special program filmed aboard the U.S.S. *George Washington* during a mission that included the launching of its missiles into the Atlantic missile range. NBC, December 19.

Red China (*NBC White Paper*)—Films and interviews with travelers in Red China, obtained from various sources, including Swiss film maker Fernand Gigon. NBC, February 25.

River Nile, The—Travelogue covering the waterway from its source to the Mediterranean; narrated by James Mason; produced by Lou Hazam. NBC, October 28.

Shakespeare: Soul of an Age—Excerpts from Shakespeare's plays, filmed in Great Britain and France; with Michael Redgrave and narrator Ralph Richardson. NBC, November 30.

Teahouse of the August Moon (*Hallmark Hall of Fame*)—Comedy by John Patrick; with John Forsythe, David Wayne, Miyoshi Umeki, Paul Ford; produced and directed by George Schaefer. NBC, October 26.

Thunder on the Right (*C.B.S. Reports*)—Documentary study of conservative thought in the United States; various right-wing speakers; narrated by Eric Sevareid. CBS, February 22.

Tour of the White House, A—Study of the history, furnishings, and works of art of the White House; narrated by Mrs. John F. Kennedy, accompanied by Charles Collingwood. CBS and NBC, February 14 (later shown on ABC and repeated by CBS).

Tunnel, The—Documentary about a group of West Berlin students who dug a 450-foot tunnel into East Berlin to rescue 59 compatriots. NBC, December 10.

U.S. 1: American Profile—Documentary study of U.S. Highway No. 1, extending from Fort Kent, Me., to Key West, Fla.; narrated by Van Heflin. NBC, March 29.

Walking Hard—Documentary study of juvenile delinquency in New York City and suburbs; produced by Larry Johnson, directed by Allen Robertson; narrated by Eli Wallach. ABC, June 26.

World of Jacqueline Kennedy, The—A Special Arts Program portrait of the First Lady; narrated by Alexander Scourby, and with filmed comments by Pierre Salinger, Oleg Cassini, Margaret Mead, and the late Eleanor Roosevelt. NBC, November 30.

RAILROADS

Class I railroads of the United States in 1962 ended a two-year decline in freight traffic and operating revenues and a six-year decline in net income.[1] However, the margin of recovery was slight, and a large segment of the industry, particularly in the East, remained dangerously near insolvency. Principally, the year was notable for developments which promised greater railroad recovery in the future.

The existence of costly and outmoded work rules for railroad operating employees was in 1962 confirmed by a Presidential Railroad Commission after a 13-month study. The commission's report, issued on February 28, called for the gradual elimination of firemen on diesel freight and yard locomotives, and made other recommendations to correct deficiencies and to protect the employees affected by the changes. The recommendations were accepted by the railroads, but were rejected by the unions. Court action brought by the unions to enjoin the railroads from effecting them unilaterally was unsuccessful.

A five-year dispute between the Chicago and North Western Railway and the Order of Railway Telegraphers was resolved through binding arbitration after a telegraphers' strike halted the road's operations from August 30 to September 28. The dispute, over the railroad's right to close or consolidate small stations without union consent, was resolved in favor of the railroad. The decision was expected to set the pattern for settlement of similar disputes. (See also LABOR.)

Legislation.—In a historic transportation message to Congress on April 5, 1962, President Kennedy called for a reversal of the long-term trend toward tighter government regulation of transportation, saying: ". . . less federal regulation and subsidization is in the long run a prime requisite of a healthy intercity transportation network." The president recommended giving railroads the right to reduce their rates, without interference by the Interstate Commerce Commission (ICC), on commodities which the Interstate Commerce Act exempted from regulation when being moved by motor carrier or barge. This proposal, the heart of the president's recommendations, was the subject of hearings before the commerce committees of both houses of Congress, and a decision in 1963 was anticipated.

An industry goal long sought as a means of promoting railroad modernization was realized in midyear with the Treasury Department's announcement of shorter depreciable lives for railroad plant and equipment. Additional investment stimulus was provided by congressional enactment of measures to permit a 7% annual tax credit for capital expenditures and to increase from five years to seven years the period in which common carriers may carry forward their operating losses as tax deductions.

Railroad passenger traffic, generally in decline since World War II, was helped by repeal of the 10% federal tax on passenger fares, effective Nov. 16, 1962. However, President Kennedy's proposal for $500 million in federal aid to urban regions "for the revitalization and needed expansion of public mass transportation" failed of enactment.

Mergers.—As a determined effort by railroad unions to have Congress declare a moratorium on railroad mergers failed, Congress was seen to be encouraging the ICC to act on the merger proposals before it. Awaiting ICC decision were four major proposed mergers: (1) the Pennsylvania and the New York Central; (2) the Seaboard Air Line and the Atlantic Coast Line; (3) the Great Northern, the Northern Pacific, and the Chicago, Burlington and Quincy (also involved was the proposed purchase of the Pacific Coast Railroad and lease of the Spokane, Portland, and Seattle); and (4) the Norfolk and Western and the New York, Chicago and St. Louis. The Norfolk and Western Railway also proposed to lease the Pittsburgh and West Virginia Railway.

The Chesapeake and Ohio Railway received ICC approval to acquire control of the Baltimore and Ohio as the first step in a proposed merger of the two roads. The Southern Railway and the Detroit, Toledo, and Ironton Railway were authorized to acquire, respectively, control of the Central of Georgia and Ann Arbor railways. Railroads involved in merger, lease, or control proposals represented 60% of total miles of railroad operated, and 67% of railroad revenue.

Financial Results.—In 1962, railroads in the United States had total operating revenues of $9.44 billion, 2.8% higher than in 1961. Operating expenses were $7.42 billion, 2% higher than in 1961. Net railway operating income, before deduction of interest and other fixed charges, was $726 million, compared with $538 million in 1961; this increase included new tax depreciation rates and investment credits. Earnings were equal to a return of 2.67%.

Freight Traffic.—Railroad freight carloadings and ton-miles (one ton carried one mile) increased in 1962 for the first time since 1959. (See Table 1.) Loadings in the last half trailed the 1961 period, but the loss was not enough to offset first half gains. As a result, total carloadings of 29 million were up about 1% over 1961 and total ton-miles of 570 billion were up nearly 2%.

Table 1—FREIGHT TRAFFIC

Year	Tons originated (millions)	Ton-miles (millions)	Ton-miles (% increase over 1939)
1939	901.7	333,438	...
1944 (peak war year)	1,491.5	737,246	121.1
1947 (peak postwar year)	1,537.5	654,728	96.4
1961	1,225.0	563,304	68.9
1962 (estimated)	1,230.0	580,000	74.1

Trailer-on-flat-car loadings increased for the ninth consecutive year. Volume totaled 705,000 cars, or 19% over 1961.

Passenger Traffic.—Revenue passenger miles declined in 1962 for the 12th consecutive year. Total volume of 19.5 billion passenger miles was 4% below 1961 and the smallest since the depression year of 1935. (See Table 2.) However, through the discontinuance of additional money-losing trains and by other economies the passenger deficit was reduced to below $400 million, a 16-year low.

[1] Figures and statements herein refer to Class I railroads only. These railroads account for about 95% of all railroad performance. All figures for 1962 are partly estimated.

Table 2—PASSENGER TRAFFIC

Year	Passenger-miles (millions)	Per cent increase over 1933
1933 (record low)	16,341	...
1935	18,476	13.1
1944 (peak war year)	95,549	484.7
1961	20,287	24.1
1962 (estimated)	19,500	19.3

Facilities.—Railroads spent more on new plant and equipment than in 1961, but expenditures fell below the annual postwar average of $1,022 million for the fifth consecutive year. Total expenditures of $800 million included $540 million for new equipment and $260 million for improvements to fixed plant. Railroad plant and equipment consisted of 207,000 miles of road (338,000 miles of tracks), 28,500 locomotives (mostly diesel-electric), 1,575,000 freight cars, and 22,500 passenger-train cars.

Employment.—Railroad employment declined in 1962 for the 12th consecutive year, the average for 1962 being 700,000, a new low for the 20th century. Nonoperating employees received wage increases totaling 10.28 cents an hour (4 cents effective February 1 and 6.28 cents effective May 1), which added $102 million a year to railroad operating costs. Unions of operating employees also demanded higher wages and benefits, and negotiations were continuing at the end of 1962.

Rates and Fares.—There were no general freight rate increases in 1962. Instead, most railroads continued to make competitive rate adjustments in an effort to increase net income by increasing traffic volume. Eastern railroads, which suffered the heaviest deficits, received ICC authority to raise passenger fares by 10%, coincident with repeal of the 10% federal tax effective November 16.

Research.—After years of intensive research, the perennial and costly railroad problem of overheated car journals (hotboxes) was rapidly being overcome. Despite constantly heavier loads hauled at faster sustained speeds, car journals were steadily setting new records of trouble-free performance. In June 1962 the average number of miles operated for each car set out between division terminals, due to overheated journals, totaled 938,576, or more than three times the average of June 1961.

In large part, this impressive gain resulted from the almost complete transition from the traditional method of journal lubrication by means of oil-soaked waste packing to the use of new types of lubricating pads. An estimated 95% of all solid-bearing freight cars were equipped with such pads in 1962; and after May 1, freight cars not so equipped were not acceptable for operation in interchange service.

Foreign Railroads.—Statistics on railway traffic in major countries are provided in Table 3.

Table 3—RAILWAY TRAFFIC, BY MAJOR COUNTRIES

(In millions of passenger-kilometers and freight net ton-kilometers; one kilometer equals 0.62137 mile)

Country	Passenger-km. 1959	Passenger-km. 1960 (prelim.)	Ton-km. 1959	Ton-km. 1960 (prelim.)
Argentina	16,585	13,421	16,340	15,134
Australia[1, 2]	...	...	11,926	13,020

United States[24]	35,525	34,216	844,796	835,421
USSR[7]	164,400	170,800	1,429,500	1,504,400
Yugoslavia	9,250[25]	10,448[25]	12,749	13,895

Note—The figures relate to the domestic and international traffic on all railway lines within each country shown except railways entirely within an urban unit and plantation, industrial, mining, funicular, and cable railways. The figures relating to passenger-kilometers include all passengers except military, government, and railway personnel when carried without revenue; those relating to ton-kilometers are freight net ton-kilometers and include both fast and ordinary goods services but exclude service traffic, mail, baggage, and nonrevenue governmental stores.

[1] Twelve months ending June 30. [2] Government railways only. [3] Federal railways only. [4] Société Nationale des Chemins de fer belges only. [5] Includes service traffic. [6] Excludes small parcels. [7] May include service traffic. [8] Includes nonrevenue traffic. [9] Société Nationale des Chemins de fer français only. [10] Excludes occupation traffic. [11] Excludes light railways. [12] Beginning 1960, includes the Saar. [13] Twelve months beginning April 1. [14] State railways. [15] Excludes livestock. [16] Includes government traffic. [17] Full carloads only. [18] Beginning December 1959, includes Bechuanaland-Mahalapye line; prior to this period, includes Vryburg-Bulawayo line of Rhodesia Railways. [19] Spanish National Railways (RENFE) only. [20] Excludes suburban railways. [21] Includes mail and weight of mail cars. [22] Includes mail and passengers' baggage. [23] British Railways only. [24] Excludes Alaska and Hawaii. [25] Prior to 1953 excludes passengers arriving from other countries or in transit (0.6% of the total in 1953). REAPPORTIONMENT AND REDISTRICTING

In the courts, the legislatures, and the polling booths, Americans did more about legislative apportionment in 1962 than at any other time in the history of the United States.

Action began on March 26, 1962, when the U.S. Supreme Court handed down (6–2) its long-awaited decision in the case of *Baker* v. *Carr*. This suit, filed on behalf of several residents of urban areas of Tennessee, sought to force reapportionment of the legislature in accordance with the state constitution. No apportionment had been effected in Tennessee since 1901, and the growth of urban areas had created great inequality in the population of legislative districts. The court held that the manner in which seats in a state legislature are distributed was subject to scrutiny by the courts and returned the case to the federal district court in Tennessee for trial on its merits. (See also LAW.)

Prior to this opinion a long series of rulings had left the impression that the judiciary viewed apportionment as a political issue not subject to court review. Malapportionment had become chronic in many Southern states as a result of the legislatures' refusal to reapportion themselves, and individual citizens had been powerless to force action. In Northern and Western states legislatures had generally reapportioned themselves on a regular basis, but the formulas used had discriminated against urban areas. Now what had been an ignored or hopeless problem became the most important issue concerning the fundamental structure of American state government.

The public and legal reaction to the Supreme

Court's ruling in *Baker* v. *Carr* was immediate. Within hours after the opinion had been announced, suits were instituted in states in all sections of the country. Before the end of the year, more than 50 cases had been filed in 35 states. Special legislative sessions were called in 10 states, and in 2 of them, Florida and Mississippi, more than one such session was necessary because the voters rejected the reapportionment formula that the first special session had produced. Georgia legislators had to meet twice on the issue, as first the county unit system (somewhat similar to the national Electoral College) was declared invalid (April 28), and then the state's apportionment was overruled (May 25).

New apportionment formulas were instituted in Alabama, Georgia, Maryland, and Tennessee in time for their application in the November elections. At that time the electorate of 12 states voted on either an initiative or a referendum measure that was a direct result of the new interest in apportionment created by the Supreme Court's action. (In addition, Hawaii and New York had routine measures on the ballot that dealt with the subject but did not affect the apportionment formulas.) Colorado was the only state to adopt an entirely new plan, but Nebraska, North Carolina, Oklahoma, and Tennessee approved modifications of the present system. New plans were defeated in California, Florida, Mississippi, Oregon, and Washington. Three of these plans would have thwarted urban demands for greater representation, while two of them—in California and Washington—would have benefited urban residents. Georgians approved part of a new plan, while in West Virginia a modification of the present law was turned down.

It is impossible to state that any specific rules for what constitutes a just apportionment have been established either by the courts or by a vote of the people. One criterion, however, has achieved semiofficial status—that is, that at least one house of a legislature must be based on equal representation according to population. This has been the ruling of the overwhelming majority of the courts, and the various formulas adopted by the voters in November also contained this feature. Nevertheless, the population criterion has often been modified or ignored for the second house of a legislature. In Nebraska, the only state with a unicameral legislature, the electorate approved a mixed formula that gave major weight to population representation and partial consideration to land area.

Meanwhile, five apportionment cases, all decided by lower courts between April and September, were appealed to the Supreme Court. One case, dealing with the Georgia unit system, was unique but possibly had relevance for the inhabitants of all states; the others—from Alabama, Maryland, Michigan, and New York—introduced almost every major issue involved in the apportionment controversy.

In Alabama a United States district court ruled on April 14 that both houses of the state legislature had to be reapportioned on the basis of population as required by the Alabama Constitution. When the legislature failed to adopt corrective measures that met the court's criteria, the court itself laid down a new plan on July 21. This was the first time that a federal court had redistricted a state. It was necessary, the court said, to "release the stranglehold" and make it possible for the next legislature to create a permanent and equitable apportionment.

The highest courts of Maryland and Michigan took opposite stands on the issue of whether both houses of a legislature must be based on population. On July 23, Maryland's Court of Appeals ruled that if the lower house were based primarily on population, the Senate could be constituted on some other basis. The court also approved the legislature's plan for the House, which placed considerable emphasis on population but still left the urban areas underrepresented. Both actions were being challenged. The Michigan State Supreme Court ruled on July 18 that both houses must adequately reflect actual population distribution. By invalidating the present apportionment of the Michigan Senate, the court ruled that a measure adopted by a vote of the people of the state was in conflict with the 14th Amendment of the federal Constitution.

New York's complex formula for apportioning Assembly and Senate seats was upheld on August 17 by a federal district court. A complaint had been made that the formula was discriminatory, since the more heavily populated counties were assigned legislative seats in a less advantageous manner than small counties.

Not only states but also local units of government were involved. In Ohio a state court ordered the City of Cleveland to redraw its ward boundaries to bring them into relation with population, and in New York, Suffolk County was sued to reapportion its Board of Supervisors.

Senior Associate, National Municipal League.

RECLAMATION. See Index entry.

RECORDINGS

Highlights of the year 1962 in recordings are reviewed in this article in three sections: (1) Popular Records; (2) Classical Records; and (3) Jazz Records. For additional information, see the Index entries *Talking Books* and *Tape Recording.*

Popular Records

It was "exit laughing" for the record industry as 1962 drew to a close. The glee was caused by a banner sales year which promised to push the industry's volume to a new, all-time high of around $560 million, and particularly by two comedy albums that swept the nation like wildfire. *The First Family* (Cadence) with Vaughn Meader doing a hilarious takeoff of the president, and *My Son, the Folk Singer* (Warner Bros.) in which Allan Sherman provided brilliant parodies on the Belafonte school of folk singing, became the fastest selling records in the history of the industry. The former also promised to become the all-time best seller.

It was, in general, a good year for the industry in terms of volume sales. Particularly gratifying was the strong upsurge staged by the popular singles record, the irreplaceable medium for the record manufacturer in providing continuous exposure to established artists and in showcasing new talent. Indicative of the upsurge in volume were the certifications for Gold Record Awards conducted by the Record Industry Association of America. In 1961, 15 long-playing albums and 2 singles records qualified for the award; in 1962, 38 long-playing albums and 4 singles records were certified. (To qualify for an RIAA certification, a single must have sold a minimum of 1 million units; a long-playing album, a minimum of $1 million in factory billing.)

While the twist was the most popular fad as the year began, it was the bossa nova—a wedding of jazz and Brazilian samba beat—that captured the public's interest as the year came to a close. In between came such dance fads as the mashed potato, the Watusi, and locomotion.

The year also saw Congress acknowledge the seriousness of the counterfeit record racket (which was robbing the industry of an estimated $20 million annually) by passing a law making counterfeiting punishable by up to a year in jail and/or a fine of up to $1,000.

Down Beat, a jazz magazine circulated among the public, and *Billboard Music Week,* a trade newspaper, conducted polls of favorite performers in 1962. (The former polled its own readers; the latter, the nation's disk jockeys). The results were:

Down Beat

Male vocalist—Frank Sinatra (Capitol, Reprise)
Female vocalist—Ella Fitzgerald (Verve)
Vocal group—Lambert-Hendricks-Bavan (Columbia)
Big jazz band—Duke Ellington (Columbia, United Artists)
Big dance band—Count Basie (Roulette)
Jazz combo—Dave Brubeck (Columbia)
Hall of Fame—Miles Davis (Columbia)

Billboard

Male vocalist—Frank Sinatra (Capitol, Reprise)
Female vocalist—Connie Francis (M-G-M)
Vocal group—The Four Freshmen (Capitol)
Instrumentalist—Acker Bilk (Atlantic)
Instrumental group—Dave Brubeck (Columbia)
Orchestra—Si Zentner (Liberty)

The top ten monaural long-playing albums which dominated the sales charts during 1962 (although not necessarily in order of total unit sales) were: *West Side Story,* sound track (Columbia); *Breakfast at Tiffany's,* Henry Mancini (RCA Victor); *Blue Hawaii,* Elvis Presley (RCA Victor); *West Side Story,* original cast (Columbia); *The Sound of Music,* original cast (Columbia); *Time Out,* Dave Brubeck (Columbia); *Camelot,* original cast (Columbia); *Your Twist Party,* Chubby Checker (Parkway); *Knockers Up,* Rusty Warren (Jubilee); and *Judy at Carnegie Hall,* Judy Garland (Capitol).

Stereo albums that remained longest on the popularity charts during the year were: *West Side Story,* sound track (Columbia); *Breakfast at Tiffany's,* Henry Mancini (RCA Victor); *Stereo 35 mm,* Enoch Light and his Orchestra (Command); *Camelot,* original cast (Columbia); *The Sound of Music,* original cast (Columbia); *Blue Hawaii,* Elvis Presley (RCA Victor); *Judy at Carnegie Hall,* Judy Garland (Capitol); *West Side Story,* original cast (Columbia); *Time Out,* Dave Brubeck (Columbia); and *Moon River,* Lawrence Welk (Dot).

Best-selling popular single records included: *Stranger on the Shore,* Acker Bilk (Atco); *I Can't Stop Loving You,* Ray Charles (ABC-Paramount); *Mashed Potato Time,* Dee Dee Sharp (Cameo); *Roses Are Red,* Bobby Vinton (Epic); *The Stripper,* David Rose (M-G-M); *Johnny Angel,* Shelley Fabares (Colpix); *Ramblin' Rose,* Nat King Cole (Capitol); *Loco-motion,* Little Eva (Dimension); *Let Me In,* Sensations (Argo); and *Alley Cat,* Bent Fabric (Atco).

HENRY BRIEF,
Executive Secretary, Record Industry Association of America, Inc.

CLASSICAL RECORDS

The year 1962 marked the fifth anniversary of the birth of stereo, and it was clear that ways and means of utilizing the techniques were by no means exhausted. The most outstanding and controversial record of the year, in this respect, was the London recording of Richard Strauss' *Salome,* in which no pains were spared to bring the orchestral detail into clear focus without overwhelming the voices, and to create dramatic effects of staging. A few critics protested the emphasis given to sheer sonics, but the great majority found this release to be a powerful re-creation of Strauss' work. All agreed on the excellence of the performance itself.

Technological advances did not preclude recordings in which the sound was necessarily of secondary importance: the release of three sets of "live" performances argued the desirability of capturing concerts of historical significance in the making. Columbia released three volumes of Sviatoslav Richter's Carnegie Hall recitals; RCA Victor issued a "highlights" disc drawn from Artur Rubinstein's series of ten recitals at Carnegie Hall the preceding winter; and the opening concert in New York's Philharmonic Hall at Lincoln Center was documented in a two-disc set by Columbia Records.

It was coincidental that while the opening of Philharmonic Hall provided a new location for recording in the United States, another setting was afforded by the completion of RCA Victor's large new recording plant in Rome. Studio A, one of four studios in the building, was said to be the largest in the world, capable of accommodating as many as 250 musicians. The acoustical design of the room was intended to approximate that of a moderately "live" opera house, and RCA voiced the hope that other companies would lease the studio for opera recordings. RCA's own first venture in the new setting was a recording of *Madama Butterfly* starring Leontyne Price; it was made in July and scheduled for release early in 1963.

Another newsworthy undertaking on foreign soil was made by Mercury, the first American record company to take its own equipment and personnel to the Soviet Union. The initial release in the Russian series was a taping of piano con-

Fastest-selling album of all time, *The First Family,* features Vaughn Meader (*right*) mimicking President Kennedy.

CADENCE RECORDS

certos—the Prokofiev Third and the Rachmaninoff First—by Byron Janis with the Moscow Philharmonic under Kyril Kondrashin.

The death within the year of two great musicians, Bruno Walter and Fritz Kreisler, created a new demand for recordings made by them. Columbia issued as a Walter memorial a Mahler Ninth Symphony under the late conductor's direction, accompanied by a record of rehearsal excerpts and an interview of some years before; Angel also made available on the Great Recordings of the Century series Walter's Act I of *Die Walküre* with Lotte Lehmann and Lauritz Melchior, recorded in 1936. RCA Victory saluted Kreisler with a two-disc album of performances in which the violinist is heard with such notable colleagues as Rachmaninoff, Zimbalist, McCormack, and Geraldine Farrar.

Among the notable events of 1962 was the return of Vladimir Horowitz to the recording studio after an absence of some years. His recital disc for Columbia stirred enthusiasm from all quarters. Another famous artist heard on records after a long absence was Joseph Szigeti, whose performance of the Bach Sonatas and Partitas for Solo Violin was released by Vanguard.

Two small new record companies attracted attention by issuing a few 12-inch records to be played at 45 rpm. rather than at the standard 33⅓. One of these discs in particular (works for flute ensembles by Joseph Bodin de Boismortier and Michel Corrette, on Connoisseur Society) made a convincing case for the clarity and distinct separation obtainable at the faster speed, with no loss of actual playing time.

Following is a sampling of notable recordings which appeared in 1962, other than those mentioned above. Except where otherwise indicated, all are available in both stereo and monaural form.

Bach, Mass in B minor: Saramae Endich, Adele Addison, Florence Kopleff, Mallory Walter, Ara Berberian; Robert Shaw Chorale and Orchestra, Robert Shaw, conductor (RCA Victor; 3 discs).

Bach, *St. Matthew Passion:* Elisabeth Schwarzkopf, Christa Ludwig, Peter Pears, Nicolai Gedda, Dietrich Fischer-Dieskau, Walter Berry; Philharmonic Choir and Orchestra, Otto Klemperer, conductor (Angel; 5 discs).

Beethoven, Symphony No. 4 in B flat, Op. 60; *Leonore Overture* No. 3, Op. 72a: Pittsburgh Symphony Orchestra, William Steinberg, conductor (Command).

Beethoven, Variations for Piano: Alfred Brendel, piano (Vox; 3 discs, mono only).

Britten, *Noye's Fludde:* Sheila Rex, Owen Brannigan, and other soloists; Children's Chorus and An East Suffolk Children's Orchestra, Norman del Mar, conductor (London).

Bruch, *Scottish Fantasia,* Op. 46/Vieuxtemps, Concerto for Violin and Orchestra, No. 5, in A minor, Op. 37: Jascha Heifetz, violin; New Symphony Orchestra of London, Sir Malcolm Sargent, conductor (RCA Victor).

Cilèa, *Adriana Lecouvreur:* Renata Tebaldi, Giulietta Simionato, Mario del Monaco, and other soloists; Chorus and Orchestra of Accademia de Santa Cecilia (Rome), Franco Capuana, conductor (London; 3 discs).

Foss, *Studies in Improvisation:* Lukas Foss, piano; Improvisation Chamber Ensemble (RCA Victor).

Handel, *Alcina:* Joan Sutherland, Graziella Sciutti, Teresa Berganza, Ezio Flagello, and other soloists; London Symphony Chorus and Orchestra, Richard Bonynge (London: 2 discs).

Handel, *Messiah:* Joan Sutherland, Grace Bumbry, Kenneth McKellar, David Ward; London Symphony Orchestra, Sir Adrian Boult, conductor (London; 3 discs).

Hindemith, *Mathis der Maler* (excerpts): Pilar Lorengar, Donald Grobe, Dietrich Fischer-Dieskau; Radio Symphony Orchestra (Berlin), Leopold Ludwig, conductor (Deutsche Grammophon).

Holst, *The Planets,* Op. 32: Women of the Vienna State Opera Chorus; Vienna Philharmonic Orchestra, Herbert von Karajan, conductor (London).

Ives, Sonata for Piano, No. 2 ("Concord"): George Pappastavrou, piano; Bonnie Lichter, flute (Composers Recordings, Inc.).

Martin, *Le vin herbé:* Basia Rechitzka, Hélène Morath, Oleg de Nyaznkowskyj, and other soloists; Frank Martin, piano; members of the Winterthur Symphony Orchestra, Victor Desarzens, conductor (Westminster; 2 discs).

Schubert, *Die schöne Müllerin,* Op. 25: Dietrich Fischer-Dieskau, baritone; Gerald Moore, piano (Angel; 2 discs).

Stravinsky, *The Flood;* Mass: Laurence Harvey, Elsa Lanchester, and other speakers; Richard Robinson, Robert Oliver, John Reardon, soloists; Columbia Chorus and Columbia Symphony Orchestra, Robert Craft and Igor Stravinsky, conductors (Columbia).

Stravinsky, *Petrouchka:* Columbia Symphony Orchestra, Igor Stravinsky, conductor (Columbia).

Tchaikovsky, Concerto for Piano and Orchestra, No. 1, in B flat minor, Op. 23: Sviatoslav Richter, piano; Vienna Symphony, Herbert von Karajan, conductor (Deutsche Grammophon).

Varèse, *Arcana; Déserts; Offrandes;* Dona Precht, soprano; Columbia Symphony Orchestra, Robert Craft, conductor (Columbia).

Verdi, *Aida:* Leontyne Price, Rita Gorr, Jon Vickers, Giorgio Tozzi, and other soloists; Chorus and Orchestra of the Rome Opera House, Georg Solti, conductor (RCA Victor; 3 discs).

Wagner, *Die Walküre:* Birgit Nilsson, Jon Vickers, George London, and other soloists; London Symphony Orchestra, Erich Leinsdorf, conductor (RCA Victor; 5 discs).

French Opera Arias: Maria Callas, soprano; Orchestre National de la Radiodiffusion Française, Georges Prêtre, conductor (Angel).

The Heifetz-Piatigorsky Concerts, with Primrose, Pennario, and Guests (RCA Victor; 3 discs).

Spanish Song of the Renaissance: Victoria de los Angeles, soprano; Ars Musicae Orchestra, José M. Lamana, conductor (Angel).

ROLAND GELATT,
Editor, "High Fidelity" Magazine.

JAZZ RECORDS

Jazz recordings released in 1962 reflected the growing worldwide basis that jazz has acquired since World War II. This was most noticeable in the wave of popularity of the bossa nova—a light, airy, jazz-oriented variation of the samba—which was developed by a clique of young Brazilian musicians.

A few American musicians had recorded an occasional bossa nova, but it was not until the release in the spring of 1962 of *Jazz Samba* (Verve 8432; stereo 6–8432), on which the trio of guitarist Charlie Byrd was joined by tenor saxophonist Stan Getz, that the bossa nova became the cynosure of jazz circles. Among the recorded performances of real merit were, in addition to *Jazz Samba,* another Charlie Byrd disc, *Latin Impressions* (Riverside 427; stereo 9427), Herbie Mann's *Right Now* (Atlantic 1384; stereo S-1384), Lalo Schifrin's *Bossa Nova* (Audio Fidelity 1981; stereo 5981), and Paul Winter's *Jazz Meets Bossa Nova* (Columbia CL-1925; stereo CS-8725).

Richard Strauss' *Salome,* starring Birgit Nilsson and conducted by Georg Solti (*inset*), was a prize-winning 1962 disc.

The major triumph of jazz on the international scene in 1962 was a six-week tour of the Soviet Union by Benny Goodman and his orchestra, the first time that a jazz group had been officially invited to perform in the USSR. Selections recorded by the band in Moscow make up *Benny Goodman in Moscow* (RCA Victor LOC-6008; stereo LSO-6008; two discs); members of the band, without Goodman, recorded *Jazz Mission to Moscow* (Colpix 433; stereo S-433) after their return to the United States.

The impact of jazz on other countries was the subject of a musical show written by pianist Dave Brubeck and his wife, in which a leading character is patterned on Louis Armstrong. This was one of the first attempts to write an entire musical in jazz terms. Although the musical has not yet been produced, a portion of the score was recorded in 1962, with Armstrong singing and playing the role designed for him (*The Real Ambassadors,* Columbia OL-5850; stereo OS-2250).

The first real fruits of an ambitious five-year program of jazz reissues by Columbia Records arrived in 1962, starting with a four-disc survey of the work of Fletcher Henderson's orchestra, generally considered to have been the first big jazz band (*The Fletcher Henderson Story,* Columbia C4L-19). This was followed by three-disc collections of the early recordings of Billie Holiday (*The Golden Years,* Columbia C3L-21) and of a 20-year span of Mildred Bailey's career (*Her Greatest Performances,* Columbia C3L-22), along with an entertaining four-disc miscellany of the groups and individuals who made 52d Street in New York the heart of the jazz world in the 1930's and 1940's (*Swing Street,* Epic 6042).

RCA Victor contributed an exceptional two-disc reissue covering some of Duke Ellington's most fruitful years (*The Indispensable Duke Ellington,* RCA Victor LPM-6009) and revitalized a lagging jazz program with a group of releases that included new recordings by Sonny Rollins (*The Bridge,* RCA Victor LPM-2527; stereo LSP 2527) and a disc recorded by Charlie Mingus in 1957 but never released previously (*Tijuana Moods,* RCA Victor LPM 2533; stereo LSP 2533).

Other jazz releases of special interest in 1962 were:

Count Basie and the Kansas City Seven (Impulse 11; stereo S-11).
Art Blakey's Jazz Messengers, *Three Blind Mice* (United Artists 14002; stereo 15002).
Benny Carter and his orchestra, *Further Definitions* (Impulse 12; stereo S-12).
Kenny Clarke–Francy Boland & Co., *The Golden Eight* (Blue Note 4092).
Miles Davis, *At Carnegie Hall* (Columbia CL-1812; stereo CS-8612).
Bill Evans–Jim Hall, *Undercurrent* (United Artists 14003; stereo 15003).
Stan Getz, *Focus* (Verve 8412; stereo 6–8412).
Dizzy Gillespie, *An Electrifying Evening* (Verve 8401; stereo 6–8401).
Barry Harris, *Listen to Barry Harris* (Riverside 392; stereo 9392).
Quincy Jones and his orchestra, *The Quintessence* (Impulse 11; stereo S-11).
Roland Kirk, *We Free Kings* (Mercury 20679; stereo 60679).
Tommy Ladnier, *Blues and Stomps* (Riverside 154).
Donald Lambert, *Giant Stride* (Solo Art 18001).
Charlie Mingus, *Chazz!* (Fantasy 6002).
Fats Navarro, *Classics of Modern Jazz,* vol. 1, (Jazzland 50).
Anita O'Day, *All the Sad Young Men* (Verve 8442; stereo 6–8442).
Original Dixieland Jazz Band, *Their Historic Recordings in England* (Riverside 156/157).
Charlie Parker, *Bird Symbols* (Charlie Parker 407).
Lester Young and the Kansas City Five (Commodore 30,-014).
Jazz at Massey Hall (Fantasy 6003).

JOHN S. WILSON,
Reviewer of Jazz Records, "The New York Times" and "High Fidelity" Magazine.

REFORESTATION. See CONSERVATION OF NATURAL RESOURCES; FORESTRY.

REFUGEES AND DISPLACED PERSONS

Political-economic problems continued during 1962 to produce new refugees or displaced peoples throughout the world, while many earlier refugee problems remained unsolved. The Office of the United Nations High Commissioner for Refugees (UNHCR) actively cooperated with some 50 countries where refugees are in residence. United Nations funds are limited, but by April 1, 1962, 31 governmental contributions (paid, pledged, or promised) amounted to $4,098,805. Of this amount, $2,685,000 was allocated for the regular UNHCR program, and $1,413,000 for Algerian refugees and assistance to new groups of refugees.

The Nansen Medal, awarded by the UNHCR for distinguished service in the refugee field, was presented for 1962 to Sir Tasman Heyes, formerly secretary of Australia's Department of Immigration.

In the United States, legislative approval was given for financial support of UNHCR and the Intergovernmental Committee for European Migration. Under the Migration and Refugee Assistance Act, signed by President Kennedy on June 28, 1962, the United States has agreed to admit refugees within UNHCR's mandate, without regard to immigration quotas but only up to 20 per cent of the number admitted by the rest of the free world. (See also IMMIGRATION AND NATURALIZATION; SOCIAL SECURITY.)

Palestinian Refugees.—A total of 1,174,760 Arab refugees from Palestine were registered by the United Nations Relief and Works Agency for Palestine Refugees (UNRWA) as of June 30, 1962. More than half of these refugees (639,145) were located in Jordan, and the remainder in Gaza (268,614), Lebanon (144,774), and Syria (122,-227). For the large numbers of children and youth among them, the UNHCR has emphasized education and training in various skills, with which some governments are helping. (See also CHILDREN AND YOUTH.) In August, the United States Agency for International Development announced a $16 million Food-for-Peace Program for the Arab refugees, to be administered by UNRWA.

European Refugees.—UNHCR's program for the clearance of camps in Europe was continued. At the beginning of 1962, there were 8,551 refugees in 131 camps in Europe. Fifty-five per cent of these refugees (4,743) were in Germany's 38 camps, 2,284 in the 90 camps in Austria, 213 in Greece's two camps, and 1,311 in the one camp in Italy. This compares favorably with the Jan. 1, 1961, totals of 15,200 refugees in 212 camps. It was hoped that resettlement or repatriation of the persons in these camps might be completed in Greece, Italy, and Austria by the end of 1962, and in Germany by the end of 1963.

Since the sealing off of East Berlin from West Berlin by the Communist wall on Aug. 13, 1961, an estimated 13,000 East Germans have escaped to establish new lives for themselves in West Berlin and West Germany, while others have been killed by the East German police in the attempt.

African Refugees.—Balubas and refugees of other tribal origins fled from their communes in the Elisabethville area during the Katanga crisis in the Republic of the Congo, and sought and were given protection by the United Nations Organization in the Congo at a camp near Elisabethville. By Aug. 1, 1962, 71,266 of the refugees had been repatriated by plane, train, and truck to the tribes from which

they came, and the camp was transferred to the Elisabethville authorities.

The reintegration of the more than 250,000 Algerian refugees repatriated from Tunisia and Morocco went forward with the assistance of the UNHCR, voluntary agencies, and the League of Red Cross Societies. In addition, the French government reported in June, 1962, that 183,000 refugees from Algeria, mainly European women, children, and elderly persons, had left their homes in Algiers to return to France and that about 11,000 others were waiting to do so.

In other parts of Africa, the UNHCR dealt with new refugee situations. These included 150,000 refugees from Angola in the Congo (Léopoldville) and 6,000 from Angola in Togo; and approximately 144,000 refugees from Rwanda in Tanganyika (9,000), Uganda (35,000), Burundi (40,000), and the Kivu area of the Congo (60,000). In all these African areas, the League of Red Cross Societies worked jointly with the UNHCR in providing material aid and services.

Hong Kong.—One of the great tragedies of history has been the effort of the Chinese to leave Communist China for the British crown colony of Hong Kong. Often this exodus is blocked by the military, since only 50 emigrants daily may enter Hong Kong by entry permits. In May 1962, 45,000 Chinese seeking refuge in Hong Kong were forcibly returned to China, while 15,000 managed to remain in Hong Kong. At least 65,000 refugees are estimated to have entered Hong Kong in 1962. There were also about 80,000 Communist Chinese refugees in the Portuguese territory of Macão in mid-1962.

Cuban Refugees.—From January 1961 to Sept. 19, 1962, 147,000 Cubans had registered at the reception center in Miami, Fla., and of that number 42,000 had been resettled in other United States cities. Many of these newcomers are skilled workers or professional people who find useful employment. All registered Cuban refugees can receive federal assistance through the U.S. Department of Health, Education, and Welfare. The sponsors of the various groups assisting Cubans on their arrival in the United States are the National Catholic Welfare Conference, the Hebrew Immigrant Aid Society, the Church World Service (Protestant), and the International Rescue Committee.

RELIGION

Major developments among the world's principal religions in 1962 are reviewed in this article under the following headings: (1) Introduction: A General Survey; (2) Protestantism; (3) Catholicism; (4) Oriental Religions, Islam, and Eastern Orthodoxy; and (5) Judaism. The largest individual bodies in the United States and Canada are treated separately under their own headings, and membership figures are tabulated in the article CHURCH MEMBERSHIP, U.S.

INTRODUCTION: A GENERAL SURVEY

Changing patterns of knowledge, and of political and social structures, were reflected in the world's religious bodies in 1962.

In Pakistan there was continued debate over changes in the marriage laws, designed to relate traditional Koranic teaching to the new role of women in democratic industrial society. In February, millions of devotees of South Asian religions which incorporate astrological beliefs in popular expressions of faith made elaborate preparations for world catastrophe at the time of conjunction of five planets; the absence of disaster subsequently was religiously interpreted.

In Japan the "Soka Gakkai," a vigorous social-religious Buddhist party, greatly increased its power in the Parliament. In October, 50 Japanese Buddhist priests visited the United States to observe the 70th anniversary of the introduction of

UPI

This family is among the refugees returning to Algeria in May at a rate of about 1,500 a day, after the cease-fire.

Buddhism to the country, and to dedicate a new Buddhist temple in New York City. Buddhism was established, and then disestablished, as the state religion of Burma. In Ceylon, Buddhist groups exercised increased influence in national affairs.

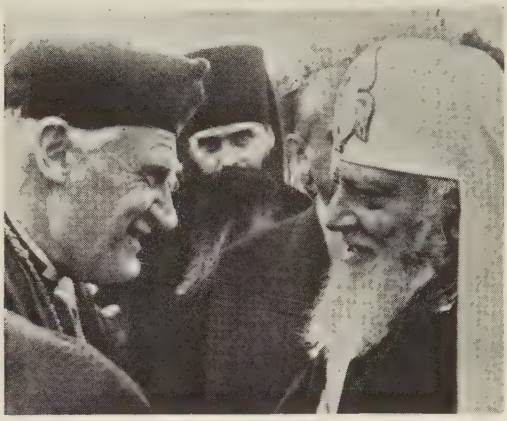
Attention was focused on the tragedy of Jews in the Hitler era by the trial and execution (on May 31, 1962) in Israel of Adolf Eichmann, leading figure in the Nazi persecutions. Vice Chancellor Ludwig Erhard of West Germany attended the dedication of a new synagogue in Worms, replacing the medieval structure gutted by the Nazis in 1938; but the Jewish population of West Germany was 30,000, as contrasted with 760,000 Jews in Germany before the Nazi era.

In June, members of the Secretariat of the World Council of Churches toured Russia, and five additional Russian churches announced interest in joining the council. In July and August, a representative group of Protestant churchmen from the United States met with a similar group from the Russian Orthodox Church in Moscow to exchange views and to explore plans for the exchange of theological students. At the same time the Soviet Communist Party called for an intensification of the state's antireligious programs.

Polls revealed that church attendance and the rate of growth of religious bodies in the United

Deplaning at Homestead AFB in Florida on December 24 are the first prisoners to be ransomed of those who were taken in the unsuccessful Cuban invasion attempt in April 1961.

WIDE WORLD



WIDE WORLD

The archbishop of Canterbury (left), visiting the Soviet Union, is greeted by Alexei, patriarch of Moscow, July 30.

States declined slightly during the year. Widespread debate followed the decision of the U.S. Supreme Court in July that the recommendation by the New York State Board of Regents that a prayer composed by the Board be recited daily in the New York public schools was unconstitutional. Some churchmen and statesmen denounced the decision as marking another stage in the secularization of the country; others hailed it as providing new guarantees of freedom of religion. Implications of the decision remained to be worked out. (See also EDUCATION; LAW.)

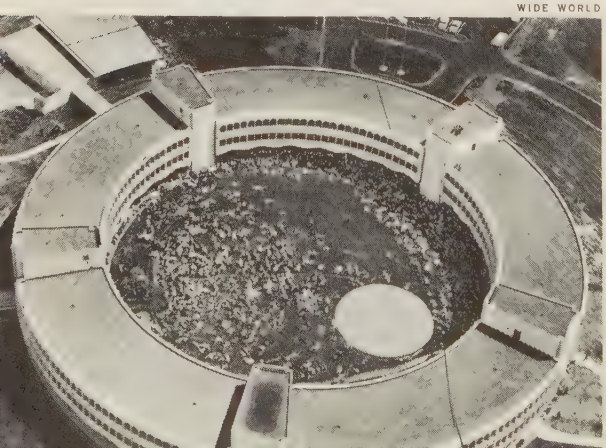
There were new steps toward the unity of American Protestant bodies. In April, representatives of the United Church of Christ, the United Presbyterian Church in the U.S.A., the Protestant Episcopal Church, and the Methodist Church met in Washington, D.C., to continue discussion of the possibilities of a merger of these bodies. In June, the American Evangelical, Augustana Evangelical, and United Lutheran Churches and the Suomi Synod merged to form the sixth largest Protestant group in the United States, with a membership of 3 million.

During the year, Pope John XXIII was visited by the archbishop of Canterbury, the moderator of the Church of Scotland, the presiding bishop of the Protestant Episcopal Church, and other leaders of non-Roman Catholic communions. In October, Ecumenical Council Vatican II (the 21st Ecumenical Council, and the second ever to be held at the Vatican) convened in Rome. Some 2,800 "fathers of the church" were in attendance, along with 28 official "observers" from non-Roman Catholic churches, including the Russian Orthodox Church. Pope John made new appeals for the revitalization of the church, for greater understanding and unity among Christian groups, and for action on the part of the world's statesmen to preserve peace and extend justice. The council elected members of 10 commissions to study and make pronouncements in major areas of ecclesiology and theology.

JAMES ALFRED MARTIN, JR.,
Danforth Professor of Religion in Higher Education, Union Theological Seminary.

New circular headquarters building of the American Baptist Convention, at Valley Forge, Pa., is dedicated on May 26.

WIDE WORLD



PROTESTANTISM

The three most noteworthy phases in Protestant growth in 1962 were the continued ecumenical growth, the advance in fraternal relations with Roman Catholicism, and the rapid expansion in Latin America.

On June 28, the Augustana Lutheran Church, Suomi Synod, United Lutheran Church, and American Evangelical Lutheran Church merged to form The Lutheran Church in America, with a total membership of 3.2 million. (See also LUTHERAN CHURCHES.) At its 55th annual convention the Church of Christ (Disciples) in the Philippines voted to merge with the United Church of Christ in the Philippines. In the United States, Methodist, United Church of Christ, United Presbyterian, and Episcopal leaders met in April to consider Dr. Eugene Blake's 1960 proposal for a "united Church, truly Catholic, truly Reformed, and truly Evangelical." An ardent supporter of such a move was Episcopal Bishop James A. Pike.

The voice of the 1961 World Council of Churches (WCC) Assembly at New Delhi, India, continued to reverberate throughout Protestantism. At their annual meetings in Paris in August 1962, the WCC Central and Executive committees addressed themselves to several basic problems: the need for clearer definition of Christian unity; the three-way struggle between confessional, ecumenical, and national churches; the relation between ecumenicity as a movement and as a set of institutions; and the problems of growth as Soviet churches join the WCC.

The U.S. National Council of Churches sponsored a number of study groups to advance the ecumenical cause at the local level. Iowa State University's School of Religion sponsored an American tour for 11 Japanese religious leaders to study religion in American life. John Weller resigned his pastorate at Purley in Surrey to devote the next five years to help the cause of unity in Great Britain. An open letter to the archbishop of Canterbury from 32 Church of England theologians, pleading for more interchurch communion, resulted in a poll of the clergy in which 43% were for and 48% against the suggested modification.

Fraternal feeling between Protestants and Roman Catholics in the United States increased in 1962. An "ecumenical dialogue" at St. James Church in Upper Montclair, N.J., was attended by 300 Protestant and Roman Catholic laymen and clergy. Protestant, Roman Catholic, and Eastern Orthodox clergy joined in retreat and dialogue at the Glenmont Jesuit House near Albany, N.Y. Episcopal Bishop Angus Dun and Roman Catholic Father Gustave Weigel participated in a symposium on the ecumenical movement at Grace Episcopal Church, Silver Springs, Md. At Alexandria, Va., a number of Protestant and Roman Catholic clergy participated in "The Octave of Prayer for Christian Unity." Protestant Professor Joseph Sit-

tler of the University of Chicago spoke on the WCC to a Roman Catholic audience at Loyola University in Chicago. Father Weigel spoke to 250 Lutheran clergy at the annual convocation at Lutheran Theological Seminary, Mount Airy, Pa. Dr. Archibald C. Craig, moderator of the Church of Scotland, visited Pope John XXIII at the Vatican. And for the first time in 400 years a cardinal from Rome (Cardinal Bea of the Vatican Unity Commission) entered Lambeth Palace, as guest of the archbishop of Canterbury. Protestant and Roman Catholic theologians collaborated in producing a special edition of the Gospel of St. Luke, published by Unité Chretienne, Lyons, France. The Second Ecumenical Vatican Council, which began October 11, was not a "reunion council," as some Protestants had hoped, but the WCC gratefully accepted the Vatican's invitation to send delegates to the council as observers.

In Latin America, where the indigenous population has doubled in 30 years, the Protestant population doubled in only 10 years, bringing the total to 8,470,000. In Mexico, Protestant membership has grown from 265,000 in 1949 to 1,065,161 in 1961.

Feb. 19, 1962, marked the 150th anniversary of the beginning of American foreign missions, when Adoniram Judson embarked at Salem, Mass., for Calcutta, India. The year also marked the 300th anniversary of the Book of Common Prayer, and the Anglican Church was again astir over the archbishop of Canterbury's proposal to revise the prayer book and make other reforms.

The U.S. Supreme Court ruling that the New York State Board of Regents' prayer, devised for public school use, is unconstitutional provoked many negative initial reactions. A wave of second thought, however, both Roman Catholic and Protestant, reflected a common belief that prayer-writing is not the business of the government. (See also EDUCATION.)

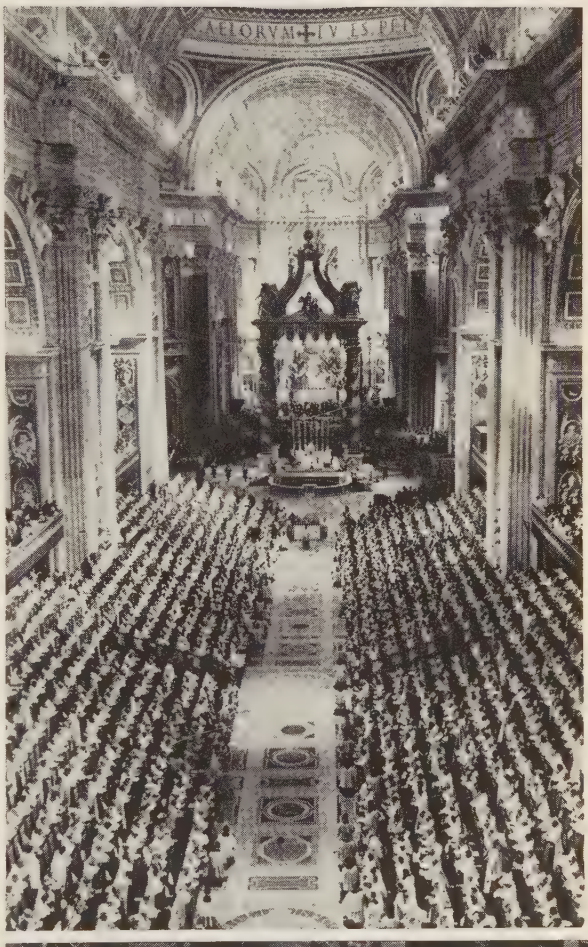
A $175,000 building at the Century 21 Exposition—Seattle World's Fair—was erected and operated by 21 denominations and 15 agencies. In April, at the University of Chicago and Princeton Theological Seminary, Karl Barth, the world-famous Swiss theologian, stressed the need for America to develop a theology which relates to its own experience.

RALPH G. WILBURN,
Dean and Professor of Historical Theology, The College of the Bible, Lexington, Ky.

CATHOLICISM

The Second Vatican Ecumenical Council opened amid liturgical splendor in St. Peter's Basilica in Rome on Oct. 11, 1962. A gathering of 2,800 cardinals, archbishops, bishops, and heads of major men's religious orders assembled under the presidency of Pope John XXIII, who told visitors that the idea of the council had come to him, "like a heavenly inspiration" during a conversation with the late papal secretary of state, Domenico Cardinal Tardini.

Speaking in Rome on April 26, Augustin Cardinal Bea, head of the Vatican's Secretariat for the Union of Christians, had said of the forthcoming council: "[It] aims at preparing—even though only on a long-term basis—the union of all the baptized, of all Christians. . . . All those



Three views of the first session of the Ecumenical Council, held at the Vatican, October 11 to December 8. (*Top*) Bishops from all parts of the world walk in procession at St. Peter's Square; (*center*) nearly 3,000 church leaders in Rome for the council attend opening ceremonies at St. Peter's Basilica; (*bottom*) Pope John XXIII, seated on the papal throne in St. Peter's, receives the cardinals.

A state funeral is held for Archbishop Theoklitos, primate of the national church of Greece, who died on January 8.

who have been baptized and in good faith accept and live the faith in which they were born and brought up . . . are on the path of salvation by virtue of this fundamental belonging to the Church of Christ."

The Roman Catholic Church in the United States was represented at the Ecumenical Council by 224 prelates, one of whom, Bishop Joseph A. Burke of Buffalo, N.Y., died shortly after his arrival in Rome. Present as observers at all council proceedings and—like the official delegates—sworn to secrecy were 34 representatives of various Protestant bodies and two representatives of the Russian Orthodox Church. The Union of Greek Orthodox Churches, headed by Archbishop Athenagoras of Constantinople, announced shortly before the opening of the council that it would not be able to attend. Under the guidance of 160 commission leaders elected by the council and 81 more appointed by the pope, the council began the systematic discussion of each of the ten schemata or discussion agenda, prepared in advance by a preliminary commission of theological experts. The first topic to be taken up was that of the church's liturgy and sacramental administration, a matter of widespread popular interest and diversity of views.

Immediately after convening, the council issued a "message to humanity," greeting "all men as brothers, irrespective of the race or nation to which they belong," and stating as the council's major concern "those who suffer hunger, misery, and ignorance."

On October 27, representatives of the churches caring for the 10 million Catholics in Africa decided to establish in Rome a special secretariat of the Pan-African Episcopacy. Africa's Negro cardinals and 60 archbishops and bishops would thereby seek unification of church administration, up to now divided among four Roman administrative units. The universality of the church had already been stressed by the canonization on May 6 of a Dominican lay brother, Blessed Martin de Porres, of Lima, Peru (d. 1639), the son of a Spanish grandee and a Peruvian mother of mixed Indian and Negro origin.

Pope John on November 13 decreed the first change in the canon of the Mass since the early 7th century. Effective December 8, the name of St. Joseph, spouse of the Virgin Mary, was inserted into one of the nine prayers of the canon, immediately following that of Mary. The canon, the most sacred part of the Mass, includes the consecration of the bread and wine, and communion.

The annual assembly of the Catholic hierarchy of the United States, held in Washington, D.C., each November, was exchanged in 1962 for a meeting of the American delegates to the council in Rome. The Ecumenical Council closed its first session on December 8; the second session was to begin Sept. 8, 1963, and there were plans for a third session to be held later.

The canonization of three saints was proclaimed by Pope John on December 9: Pierre Julien Eymard, French founder of the Congregation of the Blessed Sacrament; Angelo Maria Pucci, Tuscan founder of the Catholic Action movement; and Francesco Maria da Campo-Rosso, Capuchin monk who asked God to take his life and save the city of Genoa from a cholera epidemic in 1868.

The Laetare Medal, bestowed annually by the University of Notre Dame, was awarded in 1962 to Dr. Francis J. Braceland, a physician, former president of the American Psychiatric Association and chief psychiatrist of the Institute for Living in Hartford, Conn.

The annual James J. Hoey Award, given annually by the Catholic Interracial Council of New York for distinguished service by a white and a Negro Catholic in the cause of interracial justice, was given on October 28 to Benjamin Muse of Virginia and Dr. Eugene T. Reed of Amityville, N.Y.

Associate Editor, "America."

ORIENTAL RELIGIONS, ISLAM, AND EASTERN ORTHODOXY

The enormous problems of changeover from colonial status to complete independence and eventual self-sufficiency have so engrossed the new nations in Asia and Africa that the religions within their borders have generally been drawn into the national effort. Departure of foreign personnel has had multiple effects in itself. Reports from Netherlands New Guinea after withdrawal of the colonial administration indicated a marked breakdown of state machinery and a reversion by primitives of the interior to tribal warfare, headhunting, and traditional forms of magic and religion. In places in eastern Africa with Muslim majorities, not only have Christian missionaries and institutions come under increasing restrictions, but primitive tribes have reverted to beliefs and practices prevalent before the coming of white settlers.

Hinduism.—Prime Minister Nehru of India, having mollified the Sikhs with conciliatory measures and thus ended the 1961 hunger strikes for outright home rule, encountered increasing difficulties with Muslims in 1962. In Bengal, tension led to rioting and several deaths. Pakistani claims to Kashmir, based on the numerical superiority of Muslims to Hindus, continued to exacerbate relations between India and Pakistan. Nehru rejected the proffered good offices of the president of the United States in seeking settlement of a border dispute, on the grounds that the United Nations has accepted India's claim and the only dispute arises from Pakistan's unlawful occupation of Kashmir territory. In June the UN Security Council debated a resolution calling for a plebiscite in the disputed territory to determine who should have sovereignty over it, but this resolution was vetoed by the Soviet Union.

Agitation by conservative organizations to have Hinduism declared the state religion of India has continued but with no marked success.

Buddhism.—In Burma, early in March 1962, the Army, by a bloodless coup led by Gen. Ne Win, took over the government. Ostensibly the seizure of power was motivated by fear that the northern hill tribes would gain the autonomy they were seeking and thus divide the country politi-

cally as well as religiously. Since the Karens particularly were predominantly Christian and other hill tribes remained animists, the Buddhist monks joined left-wing organizations and labor unions in backing Ne Win. But shortly after the coup Ne Win suspended the constitution, ended official observance of the Buddhist sabbath, and abolished the decree making Buddhism the religion of the state.

The dispute which arose between Thailand and Cambodia as a result of the 1954 Thai occupation of the ancient temple of Preah Vihear was finally resolved when the International Court of Justice in June 1962 ruled that the temple was on Cambodian territory. Thailand acceded after a show of dissatisfaction.

Early in the year a statement of the Panchen Lama was made public declaring that Tibet was Chinese territory and that the crushing of "counter-revolutionary rebellion supported by imperialism and foreign reactionaries" was an internal affair in which the United Nations and other international organizations had no right to interfere. "The imperialist forces have been driven out," he declared; "feudal serfdom has been smashed, and one million serfs . . . for the first time . . . are enjoying the fruits of their labors as well as full democratic rights, including the right of freedom of religious belief." In addition to this expression of submission to the Peking line, the Panchen Lama denounced India for giving asylum to the Dalai Lama. It was announced in February that the Potala at Lhasa, which had been damaged by Chinese shelling during the 1959 Tibetan revolt, had been restored after extensive repairs, including the rebinding of 1,000 volumes of scriptures and the retouching of murals.

In April 1962, married and celibate monks in South Korea united in a Buddhist Reconstruction Emergency Congress, thus ending an 8-year feud.

Islam.—In certain areas of the Muslim world, economic stringencies have caused leaders to hold that the month-long observance of the fast of Ramadan is contrary to the public interest. Premier Bourguiba of Tunisia in 1962 lent his support to this view.

When President Nasser of the United Arab Republic declared early in March that Islam was incompatible with communism but not with socialism, King Saud of Saudi Arabia countered publicly that it was incompatible with both. Tension between the countries led to Saudi Arabia's rejection of the Egyptian pilgrims' annual offering of a holy carpet for the Mecca shrine.

Nearly 200 Muslim leaders from 40 countries met in Baghdad, Iraq, in May for the 5th session of the World Muslim Congress. The congress was addressed by the patriarch of the Orthodox Priests of Palestine, who appealed for the preservation of Christian holy places.

Eastern Orthodoxy.—Metropolitan Chrysostomos was elected primate of the Greek Orthodox churches after sharp opposition to Archbishop Iakovos' earlier election had caused the latter's abdication.

Patriarch Athenagoras declared in July at Istanbul, Turkey, that a common front among Protestant, Orthodox, and Roman Catholic churches should be created; he held that dogmatic unity between Orthodox and other Christian churches is a long-term prospect.

Delegates of the Orthodox churches have attended the sessions of the Ecumenical Council in Rome (beginning Oct. 11, 1962) as observers.

Emeritus Professor of Philosophy, Franklin and Marshall College.

JUDAISM

The Jewish population of the world was estimated at almost 13 million at the end of 1962—6,475,000 (50%) in North, Central, and South America; 3,907,000 (30%) in Europe; some 2,161,000 (17%) in Asia; 318,750 (2.5%) in Africa; and 70,000 (0.5%) in Australasia. Approximately 5.5 million resided in the United States, over 40% of whom were in New York City and its suburbs. Other large centers of Jewish population were: the Soviet Union, 2,385,000; Israel, 2,035,000; France, 500,000; Great Britain, 450,000; Argentina, 450,000; Canada, 250,000; Rumania, 180,000; and Morocco, 130,000. Except for Israel, Canada, the USSR, and Morocco, these figures are based on unofficial estimates.

Jews emigrated in large numbers from North Africa, chiefly from Algeria after the French-Algerian cease-fire agreement in March. The immigration to France—about 100,000 Jews—gave that country the fourth largest Jewish community and the largest in western Europe.

In the United States the Jewish community provided funds and services through a whole complex of national and local agencies. The United Jewish Appeal (UJA) and the American Joint Distribution Committee were the principal agencies aiding Jews in Israel and other countries.[1]

The major synagogue bodies in the United States were the Union of Orthodox Jewish Congregations, the United Synagogue (Conservative), and the Union of American Hebrew Congregations (Reform). Approximately 1.5 million Jews were affiliated with the larger Orthodox congregations, according to estimates by Orthodox rabbis; an estimated 800,000 were in 627 Reform congregations, and roughly 900,000 were in 713 Conservative congregations. While the rest of the Jewish population (over 2 million) was not included in these figures, many were members of small Orthodox synagogues.

According to a 1962 survey, 589,000 American children were enrolled in all types of Jewish schools. There were 297,400 (or 50.5%) in one-day-a-week schools, 241,200 (or 41%) in schools meeting two or more afternoons a week, and 50,000 (or 8.5%) in full-time day schools. In the 11 years 1952–62, Jewish school enrollment grew by 253,000, or over 57%.

Concern was expressed by Zionist and other Jewish pro-Israel organizations, as well as by members of Congress, with the position of the United States in the United Nations on questions affecting Israel. One source of concern was the United States vote against a draft resolution calling on Middle East governments to undertake direct negotiations on the Arab-Israel disputes. Another was the United States vote censuring Israel for its March 16 attack on a fortified Syrian port on the eastern shore of the Sea of Galilee. American government officials denied any change

[1] The major coordinating agencies furnishing national services were: the National Jewish Welfare Board (service to Jewish Community Centers and Jewish military personnel); the American Association for Jewish Education (service to local bureaus of Jewish Education); the Synagogue Council of America (representative body of synagogue and rabbinical organizations); the National Community Relations Advisory Council (service to local as well as national community relations groups); and the Council of Jewish Federations and Welfare Funds (coordinating local Jewish federations). Among the major membership agencies offering specialized programs in the Jewish community were: the American Jewish Committee (intergroup and community relations); B'nai B'rith (largest Jewish fraternal order); the B'nai B'rith Anti-Defamation League (intergroup and community relations); Hadassah (women's Zionist organization); the National Council of Jewish Women (membership and civic activity); and the National Jewish Hospital and City of Hope (health).

in the friendly American policy toward Israel.

American Jewish agencies, supported by newspaper editorials and by resolutions adopted by the legislatures of seven states, continued to oppose America's compliance with the discrimination practiced by Arab Middle East countries against American citizens who are Jewish. In July a Senate-House conference committee incorporated an anti-bias amendment into the final version of the Foreign Aid and Related Agencies Appropriations Act, 1963.

Efforts to clarify and strengthen cultural and religious relationships between American Jews and Israel included: the American Jewish Committee's opening in February of an office in Israel, which will publish a magazine (*Ammot*) in Hebrew; a 3-day American-Israeli Dialogue in Jerusalem in June, conducted by the American Jewish Congress; and the student and teacher exchange program of the American Zionist Council. The Reform and Conservative synagogue bodies established religious institutions in Israel, where only Orthodox Judaism is officially recognized.

American Jewish agencies continued to protest Soviet anti-Semitism. In a strongly worded cable in December to Soviet Premier Nikita Khrushchev, the American Jewish Committee and 46 Protestant, Catholic, and Jewish clergymen and educators urged that he abolish all discrimination.

Almost all Jewish groups supported the U.S. Supreme Court decision in June declaring unconstitutional the New York State Board of Regents prayer. (See also CIVIL LIBERTIES; EDUCATION; LAW.) Considerable controversy arose over an editorial in *America* (a Jesuit weekly magazine), September 1, which criticized Jewish agencies for their opposition to the school prayer and warned of a rise in anti-Semitism if they persisted in supporting such court action. On September 8, *America* carried a reply from the American Jewish Committee denying that anti-Semitism was being aroused by the action of Jews, and maintaining that every group in America had the right to press its viewpoint through the impartial judicial process.

REPUBLICAN PARTY

Elections in 1962 gave to Republicans new governorships in three of the large industrial states: Pennsylvania, Michigan, and Ohio. The party gained two seats in the national House of Representatives but lost four in the Senate. The new 88th Congress, after the elections, remained Democratic in the House by 258–176, with one vacancy (compared with 261–174, with two vacancies, at the end of the 87th Congress[1]) and in the Senate by 68–32 (compared with 64–36). The Republicans gained an additional Senate seat, however, as a result of the appointment of Republican Edwin L. Mechem to fill the vacancy created by the death on November 18 of Sen. Dennis Chavez (D, N.Mex.). The alignment in the new Senate thus became 67 Democrats and 33 Republicans. The Republicans won 15 governorships, for a total of 17 (a net gain of one).

Republican leaders had hoped to make larger gains, especially in the House and in the governorships, in an election year midway between presidential campaigns, a time when the party in power has often suffered setbacks. Reapportionment and redistricting after the 1960 census cost House seats in some Republican strongholds. The Cuban crisis was counted by many Republican leaders as a development which brought about Democratic votes in support of the president. Local issues and personalities were important factors in many races.

Reelection of Nelson A. Rockefeller as governor of New York by a margin of 518,218 votes placed him in the front rank of prospective candidates for the Republican presidential nomination in 1964. Rockefeller did better in New York City than he had in his 1958 race for the governorship, reducing the 1958 Democratic margin by over 100,000 votes, although his own statewide victory was gained by 55,000 fewer votes than in 1958. The election also added to possible presidential lists the names of two other Republican gubernatorial victors: William W. Scranton of Pennsylvania and George W. Romney of Michigan. Richard M. Nixon, the presidential nominee in 1960, was virtually eliminated from the 1964 race by his defeat for the governorship of California by more than 300,000 votes.

Republican organization in many key states and metropolitan areas was tightened and made more effective. In states outside the South, Republican candidates for senatorships and governorships received more than half the votes cast. In the South, seven incumbent Republicans in Congress were reelected and the party gained four additional seats from North Carolina, Florida, Tennessee, and Texas. In Oklahoma, Henry Bellmon became the first elected Republican governor in the history of the state.

A Declaration of Republican Principle and Policy was issued on June 7, 1962, with the approval of the Senate and House Republican conferences, after preparation by a joint committee headed by Representative Melvin R. Laird of Wisconsin. It offered five principles as basic party beliefs: individual liberty, limited government, diffusion of power, government with a heart, and government with a head. On domestic issues it recommended a "thorough overhaul of the tax system" to encourage production, jobs, savings, and investments; a balanced budget, reduction of federal debt, and a stable dollar; a government both "probusiness and prolabor"; shifts in agricultural resources "encouraged by a massive voluntary long-term land retirement system, increased emphasis on new uses for farm products, and improved marketing and distribution practices"; a civil rights program based on the 1960 party plat-

Former President Dwight Eisenhower, followed by New York Governor Nelson Rockefeller, gets an ovation at a Republican fund-raising dinner at Syracuse, N.Y., October 29.

[1] The House was then temporarily increased by two seats for Alaska and Hawaii until those states could be included in the new apportionment.

form; "effective tax relief for medical and hospital insurance"; "selective federal assistance to education" without federal control; and tax relief for persons financing education for themselves or others.

On international issues, the declaration proposed efforts "to reorganize and revitalize the United Nations" by changing voting in the General Assembly to a population basis; trade policies to keep American products competitive; aid to underdeveloped nations without sacrifice of "the trust of old friends in Europe"; recasting foreign aid policies to serve "the cause of freedom, without waste and within the sensible limits of careful priorities"; "superior military force so long as the Communist drive for world conquest continues"; and disarmament only with inspection.

RESPIRATORY DISEASES

While great progress has been made on the etiology of acute respiratory infections, this group of illnesses continues to be the most disabling and costly to mankind in all age groups and countries. Respiratory infections are responsible for over 50% of all acute human illnesses suffered annually in the United States. Recent household data compiled by the U.S. National Health Survey show a rate of 1.25 respiratory illnesses per person per year for the United States population as a whole. More intensive surveys in family, student, child, and industrial groups indicate an annual rate of from 4 to 6 respiratory illnesses per individual, or approximately a billion cases annually among the population of the United States. Recent reports reveal that this high prevalence of acute respiratory disease is worldwide.

Over 90% of all acute respiratory infections are of viral origin. Over 100 different viral agents have now been isolated and identified with respiratory tract illness of varying degrees of severity. These fall into several different immunologically distinct groups, and the spectrum of respiratory illnesses each group produces is gradually being clarified.

Influenza.—The epidemic influenza A_2 (Asian) virus has produced only minor sporadic outbreaks since the January epidemic of 1960. Essentially no influenza A_2 infections were recognized during the 1961–62 season, although numerous sporadic outbreaks of influenza B virus occurred throughout the United States. Because influenza A_2 virus infections have been infrequent or absent in the United States population since 1960, an epidemic outbreak is predicted by health authorities, to occur sometime during the fall and winter of 1962–63. Influenza and its accompanying complications, such as pneumonia, rank it among the first 10 causes of death in this country. Vaccination of all age groups was urged for protection against this devastating illness.

Four strains of parainfluenza viruses, which share properties with the epidemic influenza virus, have been recognized as causing frequent respiratory illnesses in childhood. They have been shown to be important causes of primary and repeated attacks of croup, pharyngitis, bronchitis, and pneumonia, with some cases terminating fatally. These agents also may produce mild upper respiratory illnesses in adults.

Respiratory Syncytial Infections.—The respiratory syncytial virus (RS), originally isolated from a chimpanzee with a cold, also has been identified by several groups of investigators as being a major cause of respiratory tract illness in infants and children. Five syndromes are recognized: pharyngitis, bronchitis, bronchiolitis, bronchopneumonia, and (rarely) croup. The majority of primary infections involve the lungs and are of major severity with some terminating fatally. Respiratory syncytial infections in older age groups of children, which usually represent reinfection, tend to be milder and in some cases without symptoms.

Rhinoviruses.—Several groups of investigators in the United States and England during the past two years have isolated by methods of tissue culture many strains of virus from the nasal secretions of young adults from military and civilian groups, with symptoms of the common cold. These represent a heterogeneous group of agents which are clinically significant as the cause of upper respiratory infections in adults. The great majority of these new virus agents (over 30 or more types), however, appear immunologically distinct from those mentioned above and are generally grouped under the name of rhinoviruses.

Adenoviruses.—Since the adenovirus group of agents was recognized in 1953 as an important cause of acute respiratory disease in the military recruit, at least 44 serotypes have been recognized, 28 from humans and 16 from animals. Types 3, 4, 7, 14, and 21 have been shown to produce epidemic respiratory tract illnesses. Types 4 and 7 continue to be the major cause (30 to 50%) of acute respiratory disease, including pneumonia, in military populations. In civilian adult groups the incidence of adenovirus infections is estimated to be only 1 to 3%. However, infections with adenoviruses occur early in life and by age 5 the majority of children have been infected with several types (1, 2, 3, 5, etc.). Adenovirus infections in infants and children are mild and ill-defined, as they are in the civilian adult population. Adenovirus vaccine containing types 3, 4, and 7 has been shown to be highly effective in preventing infections, including pneumonia due to these types, in military recruits.

Pneumonia.—A most significant advance during the past year in the etiology of acute respiratory disease has been the identification and isolation of the agent causing primary atypical pneumonia. This form of pneumonia, recognized as a clinical entity for 25 years, was thought by Monroe D. Eaton and others to be due to a virus. Recently Eaton's agent causing primary atypical pneumonia in man has been shown to be a pleuropneumonia-like organism (PPLO), and not a virus. Serological studies have revealed that Eaton's PPLO agent is responsible for approximately 10% of pneumonias in pediatric patients, 25% in college population groups, and from 25 to 52% in military recruits. Although no vaccine is as yet available, fortunately Eaton's agent pneumonia responds favorably to treatment with tetracycline therapy.

RETAIL STORE SALES

Consumer purchases at retail stores in the United States totaled $115 billion in the first half of 1962, a 5% gain over the 1961 average half-year volume. Sales established successive new highs in the first two quarters of 1962, after seasonal adjustment, and midsummer buying indi-

cated a continuation of the record levels. Prices at retail stores rose fractionally above 1961, a rate of gain that has prevailed since 1958.

Per capita retail spending in the first half of 1962 was $620. Consumers spent 60% of their income after taxes at about 2 million retail outlets. (See also COST OF LIVING.)

About one fourth of retail purchases, with a dollar value of $27.4 billion, were made at chain stores with 11 or more outlets. Chain stores sold significant proportions of general merchandise (65%), groceries (45%), apparel (25%), and drug outlets (20%).

SALES OF RETAIL STORES
(In millions of dollars)

	Year 1961	First half (seasonally adjusted) 1961	1962
All retail stores	218,811	107,701	115,195
Durable goods stores[1]	67,296	32,750	36,607
Nondurable goods stores[1]	151,515	74,951	78,588
Durable goods stores:			
Automotive group	36,906	17,826	20,868
Furniture and appliance group	10,382	5,057	5,277
Lumber, building, hardware group	10,951	5,433	5,637
Nondurable goods stores:			
Apparel group	13,730	6,750	7,089
Drug and proprietary stores	7,739	3,778	4,010
Eating and drinking places	16,403	8,166	8,576
Food group	55,421	27,550	28,406
Gasoline service stations	17,971	8,883	9,267
General merchandise group	24,907	12,055	13,248

[1] Includes estimates for other retail stores not shown separately. (Source: U.S. Department of Commerce, Bureau of the Census and Office of Business Economics.)

In the 1950's sales rose about 60% in a 10-year period. If price influences are removed, the rise equaled about 40%. The annual rate of gain in the early 1960's has been considerably smaller. Retail store sales declined 4% from the midquarter of 1960 to the winter of 1961. Five quarters of increase from the spring of 1961 to mid-1962 added 8% to sales volume.

The sharpest gain in sales from 1961 to the first half of 1962 was recorded by automotive stores—13%. General merchandise store sales rose 6% in this period, while sales of other types of retail store rose less than 5%.

On June 30, 1962, accounts-receivable balances owed to retail stores by customers totaled $13 billion, a rise of $1.3 billion in a year. Charge-account credit outstanding equaled $7 billion; installment accounts, $6 billion. Retailers' inventories were valued at $27 billion, after seasonal adjustment. The stock-sales ratio fell in 1961 and 1962, and was 1.4 in mid-1962. Durable goods inventories were $11.5 billion; nondurable goods inventories were $15.5 billion; and their respective ratios to sales were 0.9 and 1.2.

U.S. Department of Commerce.

RÉUNION

One of the Mascarene Islands in the Indian Ocean about 420 miles east of Madagascar, Réunion is an overseas department of France. It has an area of 970 square miles, and a population of 346,000 (est. 1961), mainly French Creoles of European-Asian-African descent. Saint Denis (pop. est., 50,000) is the capital and chief city. Réunion is administered by a French-appointed prefect (Jean Perreau-Pradier), who is assisted by a 36-member General Council elected by universal suffrage. French is the official language.

The economy of the country is based on sugar production. Chief crops (metric tons exported, 1961): sugar, 197,727; geranium and ilang-ilang oils, 2,355; vetiver oil, 32; rum, 156; and vanilla, 42. Total exports, 1961: 18,132 million French francs; imports, 28,509 million. Trade is primarily with France. Réunion has a 79-mile coastal railroad and 1,240 miles of roads (455 bituminized). Gillot airfield is served by several foreign airlines.

On Feb. 28, 1962, the island was struck by a severe hurricane which killed 27 persons and injured several hundred.

REVENUE. See Index entry, *Internal Revenue.*

RHODE ISLAND

A New England state of the United States, Rhode Island ranks last among the states in area (land, 1,058 square miles; inland water, 156) and 39th in population (865,000 on July 1, 1962, an 0.7% increase from the 1960 census figure of 859,488). Towns and cities with populations above 15,000 in 1960:

Central Falls	19,858	N. Kingstown town	18,977
Coventry town	15,432	N. Providence town	18,220
Cranston	66,766	Pawtucket	81,001
Cumberland town	18,792	Providence (*capital*)	207,498
E. Providence	41,955	Warwick	68,504
Johnston town	17,160	W. Warwick town	21,414
Newport	47,049	Woonsocket	47,080

Government.—Chief executive and judicial officers in 1962 included John A. Notte, Jr. (Democrat), governor, serving a two-year term; Edward P. Gallogly, lieutenant governor; August P. LaFrance, secretary of state; Raymond H. Hawksley, treasurer; Charles W. Hill, controller; J. Joseph Nugent, attorney general; Michael F. Walsh, commissioner of education; and Francis B. Condon, chief justice of the 5-member Supreme Court.

The Rhode Island General Assembly, which convenes annually, comprised 28 Democrats and 16 Republicans in the Senate in 1962 and 76 Democrats and 22 Republicans (with 2 vacancies) in the House of Representatives.

Legislation, 1962.—In the shortest regular session since 1939, the Rhode Island General Assembly completed its work in a 37-hour ordeal ending at 2:30 A.M. on April 15. Partisan struggle and efforts to serve local interests prevented effective action on some major matters. Among these were fair housing, creation of a consumer council, increase of public control over Blue Cross and Physicians Service, and reapportionment of seats in the House of Representatives.

Legislation adopted included an extensive revision of the motor vehicle code which repealed the limited license law enacted in 1961; abolition of the Milk Control Board and adoption of a milk sanitation code; mandatory installation of seat belts in all new cars beginning with the 1964 models; and increase of the minimum wage to $1.25 per hour.

Pay increases for general officers and judges raised the governor's salary from $15,000 to $25,000 and the salaries of Supreme Court justices from $17,000 to $20,000 (plus $1,000 additional for the chief justice). Other general officers received $5,000–$7,000 increases. Tax relief of over $168,000 was granted to the United Transit Company of Providence in an effort to keep the bus system in operation. The administration's entire fiscal program, including $101,000,000 in general appropriations and no new or increased taxes, was also passed. Five bond issues providing for construction of educational and welfare institutions were referred to the voters. The proposals, totaling $31 million, were approved in November.

A special session of the Assembly was convened in the summer to deal with reapportionment (see below, *Events, 1962*).

Finance.—In the 1962 fiscal year, revenue of $117,065,072 included $92,063,274 from state taxes and $16,106,054 in federal funds. Chief tax yields were the 3% general sales tax ($26,682,357) and taxes on corporate incomes ($8,400,293) and motor fuels ($17,874,867). Spending of $116,363,465 included $30,550,914 for education, $44,704,901 for health, welfare, and safety, and $9,290,601 for highways.

Education.—In the fall of 1962, public elementary schools staffed by 2,949 teachers enrolled 81,612 pupils; secondary schools with 2,830 teachers enrolled 60,940; and (fall of 1961) parochial schools with 1,434 teachers enrolled 48,613. College enrollment (fall of 1961) totaled 19,842 in 12 institutions, including 2 junior colleges and 10 senior colleges and universities.

Estimated public school spending in the 1961–62 school year totaled $62,272,000, including current ex-

penditures of $56,072,000 ($450 per pupil) and $6 million in capital outlays. Revenue of $62,272,000 was drawn chiefly from state funds ($15,702,000) and local districts ($44,270,000). Teachers' salaries averaged $5,800 (high school, $5,900; elementary, $5,715). Actual spending for higher education (1961 fiscal year) amounted to $11,041,000.

Public Assistance.—In the 1962 fiscal year, public assistance payments to a monthly average of 35,735 persons totaled $20,865,880. This amount included $9,258,578 for dependent children and $6,246,178 for the aged.

Transportation and Communications.—With 31 miles of highway construction and reconstruction completed during 1961, *highways and roads* on Jan. 1, 1962, totaled 4,393 miles (3,471 surfaced). These served 367,527 *motor vehicles* (as registered on Dec. 31, 1961), including 308,052 automobiles. Operating in the state were (1962) 4 *railroads* (using 183 lines miles of track); (1961) 6 regularly scheduled *airlines;* and 9 commercial and municipal *airports.*

Communications media included (1961) 14 AM and 6 FM *radio stations;* 2 VHF *television stations;* 7 daily *newspapers* (circulation, 299,236); and (Jan. 1, 1962) 98,400 business and 267,600 residential *telephones.*

Labor Force.—The state's labor force on Aug. 15, 1962, included 1,620 agricultural workers. Nonagricultural employment stood at 295,500, compared with 293,200 for the previous August 15. Of nonfarm employees, 40% were in manufacturing, 17.9% in trade, and 14.3% in service industries. Unemployment on Aug. 15, 1962, numbered 24,600, compared with 28,300 for the previous August 15.

Manufacturing.—Manufacturing engaged 118,686 workers in 1961, including 93,362 in production, and provided a payroll of $517,147,000. Adjusted value added by manufacture totaled $959,210,000.

LEADING RHODE ISLAND MANUFACTURES, 1961

Industry group	Total employees	Total payroll	Adjusted value added by mfr.[1]
		(in thousands)	
Textile mill products	25,774	$100,967	$188,970
Rubber and plastics products	8,600	41,422	100,958
Nonelectrical machinery	9,231	50,573	84,861
Primary metals	9,054	46,634	76,566
Jewelry and silverware	8,785	34,092	68,056
Costume jewelry and notions	10,400	37,638	60,727
Fabricated metals	7,568	32,442	55,582
Food and kindred products	6,504	29,328	54,670
Electrical machinery	6,379	25,691	51,365

[1] For definition, see footnote 1 in the article *Industrial Production.*
(Source: *1961 Annual Survey of Manufactures.*)

Mining.—Rhode Island ranked 49th among the states in the value of its mineral production in 1961, with 0.02% of the national total. The mineral value ($3,079,000) was the second highest on record, 32% more than that of 1959, but 48% lower than the 1960 total. The drop in mineral output was due primarily to less demand for riprap stone used in construction of breakwater facilities at Newport.

Agriculture.—Cash farm income for the first nine months of 1962 (excluding government payments) totaled $16,397,000, compared with $15,227,000 for the corresponding period of 1961. For the full year 1961, income comprised $13,116,000 from livestock, $7,612,000 from crops, and $86,000 in government payments. Principal income sources in 1961 were wholesale milk, $6,751,000; greenhouse and nursery products, $3,520,000; eggs, $3,006,000; and potatoes, $2,649,000.

RHODE ISLAND CROP STATISTICS

Crop (and unit of production)	Average 1951–60	1961	Est. 1962
Apples (1,000 bu.)	162	200	180
Corn, sweet (1,000 cwt.)	53	58	66
Hay (1,000 tons)	40	40	39
Potatoes (1,000 cwt.)	1,006	1,270	1,352
Tomatoes (1,000 cwt.)	46	27	29

(Source: U.S. Department of Agriculture.)

The state's 1,400 farms in 1959 had an acreage of 138,000 (34,000 in harvested cropland). Livestock on farms on Jan. 1, 1962, included 20,000 cattle, 10,000 hogs, and 391,000 chickens.

Events, 1962.—From early spring, when Mayor Kevin K. Coleman of Woonsocket made known his intention to seek the Democratic nomination for governor, until November 30, when the State Board of Elections finally announced that John H. Chafee (Republican) had been elected governor by 398 votes, politics dominated the headlines. Although Gov. John A. Notte, Jr., was endorsed by the Democratic State Central Committee, and Chafee was supported by the Republican organization, both men faced vigorous contests in the primary elections on September 11—the first same-day, same-place primaries in the state's history, and for the Republicans the first statewide primaries since 1948.

At the close of Election Day, November 6, Governor Notte led by an unofficial 47 votes, leaving the final decision dependent on nearly 7,000 absentee, shut-in, and servicemen's ballots. The validation and counting of these delayed the final decision to November 30. To serve with Chafee the voters reelected the incumbent Democratic state officers, and continued Democratic control in the General Assembly (29 to 17 in the Senate and 77 to 23 in the House). Democratic Representatives Fernand J. St. Germain and John E. Fogarty were returned to Congress by large majorities.

UPI

After official count of ballots on November 30, John H. Chafee, a Republican, is told he has won governorship of Rhode Island. The election was held on November 6.

An effort to obtain reapportionment of seats in the House of Representatives led to a complicated struggle. In April, suits were begun in both state and federal courts to compel redistribution. Shortly afterward, a commission appointed in 1961 reported a plan which would amend the state constitution to expand House membership from 100 to 125. The Assembly approved, although Governor Notte opposed the idea. On July 24 the state Supreme Court ordered that reapportionment be made immediately on the basis of the 1960 census. A special session of the General Assembly on August 7 referred the problem to a seven-member commission, but the failure of this body to report by September 5 compelled abandonment of reapportionment for 1962. On October 18, both state and federal courts approved conduct of the 1962 election without reapportionment, leaving the problem for action in 1963.

Other items deferred to 1963 were the reports of a Little Hoover Commission for major reform of the state administrative structure and of a constitutional revision commission. Also postponed by reference to a special commission for study was action on a request from the Roman Catholic diocese for state aid for its parochial schools.

Recreation was centered on maritime activity.

In September, the United States defender *Weatherly* defeated the Australian challenger *Gretel* in the America's Cup 12-meter yacht races out of Newport. The same port was the starting point in June for the 635-mile yacht race to Bermuda. (See also SPORTS, GAMES, AND SHOWS.) Across Narragansett Bay, the 20th annual United States Tuna Tournament was held in September.

RHODESIA AND NYASALAND

The Federation of Rhodesia and Nyasaland (also known as the Central African Federation) is bordered by the Republic of the Congo (Léopoldville) and Tanganyika on the north, Mozambique on the east, the Republic of South Africa and Bechuanaland Protectorate on the south, and Angola on the west. The federation comprises the self-governing territories of Southern Rhodesia and Nyasaland and the British protectorate of Northern Rhodesia, and has an aggregate area of 486,942 square miles. The total population of 8,630,000 (Dec. 31, 1961, est.) includes 8,290,000 Africans, 305,000 Europeans, 25,700 Asians, and 14,100 persons of mixed racial ancestry. Salisbury, in Southern Rhodesia, is the federal capital. The official language is English.

Government.—Federated as a British state since 1953, Southern Rhodesia, Northern Rhodesia, and Nyasaland retain their prefederation constitutional status. The federation's political future was under review in 1962. The queen is represented in the federation by a governor general (Lord Dalhousie since 1957). Party seating in the 59-member Federal Assembly (following elections of April 27, 1962): United Federal Party, 54; independent, 1 (excluding 4 specially elected or nominated seats). Prime Minister Roy Welensky, leader of the United Federal Party, appointed 10 ministers to the new cabinet on May 3, 1962. The highest judicial body is the Federal Supreme Court.

Education.—Federal school enrollment, 1961: 84,723. Number of schools (with enrollments, 1961): 352 primary and secondary (72,002 Europeans, 7,270 Asians, and 5,451 of mixed parentage); 1 university (University College of Rhodesia and Nyasaland); 1 teacher-training college. Territorial governments are responsible for African education up to the university level.

Finance.—Government revenue, fiscal year 1963 est.: £68,703,000 (£65,500,000 in fiscal year 1962); expenditure, £78,456,000 (£69,100,000). Expenditure on economic development in fiscal year 1962 was £8.1 million. Foreign exchange holdings increased by £11 million in 1961. Government loans in 1962 totaled £22 million.

Transportation and Communications.—Transport networks (miles, 1961): railways, 3,126; main roads, 11,600; local roads, 50,000 (est.). National airline: Central Africa Airways; 8 other airlines serve the federation. Other data for 1960: passenger cars, 121,271; commercial vehicles, 46,798; telephones, 97,240; radios, 61,000 (1959); television sets, 35,000 (1962).

Production.—Gross national product, 1961 est.: £555 million (up 3% from 1960). Manufacturing value, 1961: £58.3 million (up 6%), or 10.4% of gross domestic product; mining value, £148.7 million (down 4%), or 19.6% of gross domestic product. Chief minerals (metric tons exported, 1961): copper, 610,400; chrome ore, 476,000; asbestos, 133,500; and zinc, 28,000. Chief agricultural products (exports, 1961): maize, 311,461 metric tons; tobacco, 210.0 million pounds; tea, 30.1 million pounds; and peanuts, 51.0 million pounds.

Foreign Trade.—Total exports, 1961: £206.8 million (up 0.4% from 1960); imports: £155.0 million (down 1.1%). Principal exports (in millions, 1961): tobacco, £41.9; maize, £4.5; tea, £4.4; peanuts, £1.5; copper, £111.9; asbestos, £8.4; chrome ore, £3.0; zinc, £1.9; meat products, £3.3; pig iron, £2.5. Principal imports: foods, beverages, tobacco, clothing, vehicles, and other consumer goods and manufactures. The federation's chief trading partners are Great Britain, Republic of South Africa, and West Germany. Tourists in 1961 numbered 127,525.

Events, 1962.—Racial and political tensions in 1962 threatened to break up the nine-year-old federation, although the situation in Nyasaland continued to remain calm in anticipation of self-rule which Britain granted on November 23. African nationalists in Northern Rhodesia competed for votes in an important election on October 30. Southern Rhodesia experienced its bitterest racial bloodshed of the century over the issue of minority African representation in its new legislature. African nationalist agitation in the three territories was further aggravated by an antifederation campaign among United Nations members that was initiated by the Afro-Asian bloc of members and was backed by the Communist bloc. The campaign was aimed particularly at Southern Rhodesia.

To head off rumors of complicity in the death of the late UN Secretary General Dag Hammarskjöld at Ndola, Northern Rhodesia (on Sept. 18, 1961), a federal inquiry commission on February 9 blamed pilot error for the air crash.

At the opening session of the Federal Assembly on February 12, Federal Prime Minister Sir Roy Welensky said that the federation would not break up while he was prime minister. To ease criticism of the federation, he cautioned Southern Rhodesian whites to lessen their opposition to African political advancement. The British proposal to amend the constitution for Northern Rhodesia angered Welensky because it allowed for the possibility of an African legislative majority. In an effort to lessen British support for African nationalists, and knowing that the voting rules overwhelmingly favored his United Federal Party (UFP), Welensky resigned as federal prime minister on March 8 and dissolved the Assembly on the following day. He thus forced a federal election on April 27. The UFP won 54 of the 59 federal seats, thereby securing Welensky's maneuvered vote of confidence. But an election boycott by African and Asian voters, and criticism by liberal whites made Welensky's election victory a hollow one.

British relations with the federation, previously divided between colonial and Commonwealth offices, was assigned effective as of March 19 to the new Central African Office, headed by Richard A. Butler, the home secretary. Many observers believed that he would stand up to Welensky's government. Butler visited the federation on May 18–22 and won endorsement from Nyasaland's African leader, Dr. Hastings K. Banda, for a commission to study the implications of Nyasaland's withdrawal from the federation. Butler wanted time to gauge African nationalist strength in Northern Rhodesia and to study African reaction to Southern Rhodesia's new constitution, after which, it was thought, he might unveil Britain's blueprint for the federation's future. He sent a three-man British delegation in mid-July to investigate conditions under which the federation might be preserved.

Being sensitive to criticism, Welensky attacked Adlai E. Stevenson, U.S. ambassador to the United Nations, for a speech delivered in mid-April on the difficulties encountered by African countries which have large white populations. Another setback came on August 14 when Jasper Z. Savanhu, the lone African cabinet member, resigned as federal parliamentary secretary to the minister of home affairs because he believed the government's policy of racial partnership had not been implemented.

Welensky charged that pan-African and Communist agents were responsible for interparty African violence in Northern Rhodesia in April, and for violence preceding the government's banning of the Zimbabwe African People's Union in Southern Rhodesia on September 20. Foreign funds, he charged, were being used to stir up African nationalists in order to disrupt white rule in the federation in preparation for a Communist takeover. Welensky, who actively intervened in Northern Rhodesia's election campaign, was even more uncertain of the federation's future as a result of the election deadlock there on October 30 and the

formation of an African-dominated coalition government on December 14.

Southern Rhodesia

A self-governing British colony since 1923, Southern Rhodesia is bordered by the Republic of South Africa on the south, Mozambique on the east, and Bechuanaland Protectorate on the west. Area, 150,333 square miles; population, 3,200,000 (Dec. 31, 1961, est.), including 2,960,000 Africans (3,610,000 Africans according to the preliminary 1962 census est.), 221,000 Europeans, 7,100 Asians, and 10,700 others. Principal cities and estimated populations: Salisbury, the capital, 299,900 (205,000 Africans); Bulawayo, 195,600 (140,000 Africans); Umtali, 35,400 (27,000 Africans); Gwelo, 34,600 (26,000 Africans).

Government.—The unicameral Legislative Assembly has 65 members (elected Dec. 15, 1962), all of whom are Europeans. Party seating in the Assembly: Rhodesian Front Party, 35; United Federal Party, 29; independent, 1. An 8-member cabinet is headed by Prime Minister Winston Joseph Field (Rhodesian Front Party). The queen's representative is Governor Sir Humphrey Vicary Gibbs (since 1959).

Education and Religion.—Number of African schools (with enrollment, 1961): 3,082 (551,247, or over 80% of the school-age population). Government expenditure on education in the fiscal year 1963 was estimated at £4,800,000. Principal religious faiths: Anglican (39% of the European population in 1956), Presbyterian (13%).

Finance.—Government revenue, fiscal year 1963 est.: £25,462,000 (fiscal year 1962 est.: £24,210,000); total expenditure, £29,648,000 (£28,664,706). National debt as of June 30, 1961: £68,919,679.

Transportation and Communications.—Main roads, 5,115 miles; other roads, 31,162. There is an international airport at Salisbury. Other data for 1960: passenger cars, 89,000; commercial vehicles, 37,200; telephones, 80,378.

Production.—Total mineral value, 1961: £27,161,582 (£26,434,307). Chief minerals are asbestos, gold, chrome, coal, and copper. Chief crops are maize, beans, peanuts, rice, wheat, cotton, and tobacco. Livestock raising (principally cattle) is important to the economy.

Events, 1962.—On February 23 the UN Trusteeship Committee declared Southern Rhodesia's claim to be a self-governing colony was but a subterfuge to retain white rule. A special United Nations subcommittee warned on April 30 that unless Africans were granted equal rights, "serious conflict and violence would result." A resolution approved by the UN General Assembly on June 28 asked Great Britain to require Southern Rhodesian whites to enfranchise Africans. Prime Minister Sir Edgar Whitehead rejected the 73-to-1 vote of censure. The United States abstained from voting, as did Britain.

Strikes protesting low African wages spurred riots in Salisbury and Umtali on May 14. Tear gas, bayonets, and police dogs were used to quell the riots. Several Africans were killed and dozens were injured. The all-white legislature on August 21 strengthened its police powers to curb African political action.

The government on September 20 outlawed the Zimbabwe African People's Union (ZAPU) on charges that it had resorted to intimidation and terrorism, fomented violence, and possessed illegal explosives. Rhodesian planes dropped leaflets announcing the ban, 8,000 troops descended on African townships, houses were searched for weapons, ZAPU leaders were detained, and 1,603 Africans were arrested.

ZAPU's President Joshua Nkomo fled on September 23 from Northern Rhodesia to establish a government-in-exile in Tanganyika. He returned to Southern Rhodesia on October 2 and was confined by the government to the African reserve near Bulawayo where he was born.

The government was dismayed by the resignation on October 11 of Sir Hugh Foot as chief British delegate to the United Nations because of his disagreement with official British support for Whitehead's policies.

The stunning upset in the elections of December 15 swept the United Federal Party out of office. Whitehead promptly resigned as prime minister and was replaced by Winston Joseph Field, 58-year-old tobacco farmer and leader of the white supremacist Rhodesian Front Party.

Northern Rhodesia

A British protectorate since 1924, Northern Rhodesia is bounded by Angola on the west, the Republic of the Congo (Léopoldville) and Tanganyika on the north, and Nyasaland and Mozambique on the east. Area, 288,130 square miles; population, 2,510,000 (Dec. 31, 1961, est.), comprising 2,430,000 Africans, 75,000 Europeans, 8,000 Asians, and 2,000 others. Principal cities and estimated populations: Lusaka, the capital, 85,840 (72,000 Africans); Ndola, 82,400 (73,000 Africans); Broken Hill, 34,700 (30,000 Africans).

Government.—Party seating in the 45-member unicameral legislature (following incomplete election returns of Oct. 30 and Dec. 10, 1962): United Federal Party, 16; United National Independence Party, 14; African National Congress, 7. A coalition cabinet of 12 members (including 10 Africans) was announced on Dec. 14, 1962.

Sir Roy Welensky, the prime minister of the Federation of Rhodesia and Nyasaland, won a vote of confidence for himself and his United Federal Party in the elections on April 27.

AUTHENTICATED NEWS INTERNATIONAL

The queen's representative is Governor Sir Evelyn Dennison Hone (since 1958).

Education.—African school enrollment, 1961: 311,261 (about 64% of the school-age population), including 304,828 primary and 6,433 secondary pupils. There are 13 teacher-training schools, 16 trade schools, 18 domestic science schools for girls, and 2 technical colleges. Government expenditure on education, fiscal year 1961: £2,591,116.

Finance.— Government revenue, fiscal year 1962 est.: £19,789,800 (fiscal year 1961 est.: £18,239,705); expenditure, £19,775,002 (£18,637,854). National debt (June 30, 1960): £40,610,693 (including £20,413,853 assumed by the federal government).

Transportation and Communications.—Main roads, 3,800 miles; other roads, 16,000 (est.). Other data for 1960: passenger cars, 34,041; commercial vehicles, 13,012; telephones, 22,880.

Production.—Total mineral value, 1961: £121,122,591 (£128,730,838 in 1960). Northern Rhodesia is the world's second largest exporter of copper. Other minerals include silver and limestone. Chief crops are maize, millet, cassava, and peanuts. Timber production and livestock raising are important.

Events, 1962.—The election of October 30 focused on the competition for voter allegiance between the United National Independence Party (UNIP), under militant President Kenneth Kaunda, and the African National Congress (ANC), under moderate President Harry Nkumbula. At stake was the shift of political power from whites not only in Northern Rhodesia but throughout the federation. Realizing this, Welensky used his prestige to influence white voters. The election's key issue, he said on October 18, was whether or not the quarter of the world's known copper reserves in Northern Rhodesia could safely be turned over to Kaunda's irresponsible UNIP extremists. An unprecedented 92% of the 129,585 qualified voters cast ballots in 270 polling stations to fill 45 seats in the enlarged Legislative Council. About 92,000 Africans voted for the first time, many walking for miles the previous day and night to cast their vote.

The returns indicated a deadlocked vote on racial lines. Welensky's UFP won 15 seats; Kaunda's UNIP, 14; and Nkumbula's ANC, 5. One constituency election was postponed due to the death of a candidate. The deadlock hinged on the fact that no candidate for the 10 crucial so-called national seats received the necessary 10% of his opposite racial vote to qualify for victory. The Liberal Party, led by Sir John Moffat, did not win any seats. The election deadlock marked the failure of the Liberal Party to bring together moderate Africans and Europeans.

A caretaker government of British Colonial Office civil servants governed Northern Rhodesia until new elections were held on December 10 for the undecided 11

Sir Edgar Whitehead (sitting, at right), prime minister of Southern Rhodesia until his defeat in the December 15 election, hears natives at meeting in Salisbury, October 12.

UPI

seats. The ANC won 2 seats and the UFP one, but 8 seats remained undecided. Kaunda and Nkumbula in mid-December agreed to form a coalition cabinet. The UNIP-ANC coalition gave Africans a legislative majority for the first time in Northern Rhodesia's history.

Nyasaland

A British Protectorate since 1891, Nyasaland is bordered by Tanganyika on the north and east, Mozambique on the east, and Northern Rhodesia on the west. Area, 48,479 square miles (including 11,600 square miles of water); population, 2,920,000 (Dec. 31, 1961, est.), consisting of 2,900,000 Africans, 8,900 Europeans, 10,700 Asians, and 1,500 of mixed parentage. Principal cities and estimated populations: Zomba, the capital, 7,350 (6,500 Africans); Blantyre-Limbe, 62,600 (54,000 Africans); Lilongwe, 9,550 (9,000 Africans).

Government.—The Legislative Council has 33 members, of whom 28 are elected. Party seating (following elections of Aug. 15, 1961): Malawi Congress Party, 22; United Federal Party, 5; independent, 1. The 10-member Executive Council includes Dr. Hastings K. Banda, leader of the Malawi Congress Party, and 4 other party members. The queen's representative is Governor Sir Glyn Smallwood Jones (since 1961).

Education and Religion.—African school enrollment, 1961: 290,218. Principal religions: Roman Catholic (about 450,000 adherents), Church of Scotland (400,000), Moslems (500,000 to 1 million).

Finance.—Government revenue, fiscal year 1962 est.: £7,243,567 (fiscal year 1961 est.: £6,330,160); expenditure, £8,189,712 (£6,940,179); development fund expenditure, £3,961,481 (£3,456,445). National debt, June 30, 1961): £7,180,000 (the federal government was responsible for £5,180,000).

Transportation and Communications.—Railways, 500 miles; main roads, 2,800; other roads, 3,170. Other data for 1960: passenger cars, 6,355; commercial vehicles, 5,341; telephones, 5,199.

Production.—The territory is self-sufficient in agricultural products with the exception of sugar and wheat flour, which are imported. Chief crops for export are tea and tobacco. Cattle and goats are raised. Industry is practically nonexistent.

Events, 1962.—Dr. Hastings K. Banda, minister of natural resources and local government, continued to criticize the federation and Prime Minister Welensky. Banda's majority Malawi Congress Party enthusiastically prepared for Nyasaland's self-rule (granted November 23), Banda said on May 1 that he had succeeded in keeping Nyasaland quiet, much to the surprise of his white opponents. His opposition to everything federal resulted in cancellation on July 14 of a federally planned hydroelectric plant for Nyasaland.

Banda ran into opposition from missionaries who resent his party's threat to take over their traditional educational supervision of Africans. In August he accused some missionaries of telling African church members not to join his party. A new opposition political party, the Convention African National Union, was formed in August. Its announced policy of fighting "dictatorial tendencies" referred to Banda's hitherto undisputed power.

ROMAN CATHOLIC CHURCH

In the fifth consistory of his reign, March 19, 1962, Pope John XXIII created 10 new members of the Sacred College of Cardinals, raising the membership to 90 (of whom 87 are known). Aloisius Joseph Cardinal Muench (q.v.), the only United States member of the Vatican Curia, was one of five cardinals who died in 1962. Cardinal Muench, former bishop of Fargo, N. Dak., died in Rome on February 15. Other deaths were of Gaetano Cardinal Cicognani, February 5; Teodosio Clemente Cardinal de Gouveia, February 6; Teodosio Giovanni Panico, July 7; and Gabriele Acacio Coussa, July 29.

In 1962 the Roman Catholic population of the United States was listed at 42,876,665, a gain of 771,765 (about 1.8%) over the preceding year. The total world Catholic population was estimated (1961) at 550,356,721.

Catholic clergy of the United States in 1962 numbered 5 cardinals (after the death of Cardinal Muench), 34 archbishops, 195 bishops, and 55,581 priests; there were 17,156 parishes. The year's record of Catholic baptisms in the United States, according to *The Official Catholic Directory, 1962*, was 1,490,801; of converts, 128,430; and of marriages, 312,811. Conversions over a 10-year period totaled 1,354,968.
